DESCRIPTION

The FCT4X245T and FCT4X2245T are 32-bit non-inverting transceivers with three-state outputs that are useful for bus-oriented applications. The Transmit/Receive (T/R) inputs determine the direction of data flow, whether from A-to-B or B-to-A, and the Output Enable (\overline{OE}) inputs enable the selected port for output. All inputs have clamp diodes for undershoot noise suppression. All outputs have ground bounce suppression (see QSI Application Note AN-01), and outputs will not load an active bus when V_{CC} is removed from the device. The MillipaQ 80-pin small outline package provides the smallest possible footprint while also offering an easy to layout flow-through, dual-in-line format.

Notes:

- For conditions shown as Min. or Max., use the appropriate values specified under DC specifications.
- Per TTL driven input (V_{IN} = 3.4V).
- For flip-flops, Q_{CCD} is measured by switching one of the data input pins so that the output changes every clock cycle. This is a measurement of device power consumption only and does not include power to drive load capacitance or tester capacitance. This parameter is guaranteed by design but not production tested.
- Total power supply current (I_C) can be computed using the above parameters as explained in *FCT-T Family Characteristics*.
