

### FEATURES

#### DC PERFORMANCE

25  $\mu\text{V}$  max Offset Voltage (AD705T)  
 0.6  $\mu\text{V}/^\circ\text{C}$  max Drift (AD705K/T)  
 100 pA max Input Bias Current (AD705K)  
 600 pA max  $I_B$  Over MIL Temperature Range (AD705T)  
 114 dB min CMRR (AD705K/T)  
 114 dB min PSRR (AD705T)  
 200 V/mV min Open Loop Gain  
 0.5  $\mu\text{V}$  p-p typ Noise, 0.1 Hz to 10 Hz  
 600  $\mu\text{A}$  max Supply Current

#### AC PERFORMANCE

0.15 V/ $\mu\text{s}$  Slew Rate  
 800 kHz Unity Gain Crossover Frequency  
 10,000 pF Capacitive Load Drive Capability

#### Low Cost

Available in 8-Pin Plastic Mini-DIP, Hermetic Cerdip  
 and Surface Mount (SOIC) Packages  
 MIL-STD-883B Processing Available  
 Dual Version Available: AD706  
 Quad Version: AD704

### APPLICATIONS

Low Frequency Active Filters  
 Precision Instrumentation  
 Precision Integrators

### PRODUCT DESCRIPTION

The AD705 is a low power bipolar op amp that has the low input bias current of a BiFET amplifier but which offers a significantly lower  $I_B$  drift over temperature. The AD705 offers many of the advantages of BiFET and bipolar op amps without their inherent disadvantages. It utilizes superbeta bipolar input transistors to achieve the picoampere input bias current levels of FET input amplifiers (at room temperature), while its  $I_B$  typically only increases 5 times vs. BiFET amplifiers which exhibit a 1000X increase over temperature. This means that, at room temperature, while a typical BiFET may have less  $I_B$  than the AD705, the BiFET's input current will increase to a level of several nA at +125°C. Superbeta bipolar technology also permits the AD705 to achieve the microvolt offset voltage and low noise characteristics of a precision bipolar input amplifier.

The AD705 is a high quality replacement for the industry-standard OP07 amplifier while drawing only one sixth of its power supply current. Since it has only 1/20th the input bias current of an OP07, the AD705 can be used with much higher source impedances, while providing the same level of dc precision. In addition, since the input bias currents are at picoAmp

### CONNECTION DIAGRAM

Plastic Mini-DIP (N)  
 Cerdip (Q) and  
 Plastic SOIC (R) Packages

levels, the commonly used “balancing” resistor (connected between the noninverting input of a bipolar op amp and ground) is not required.

The AD705 is an excellent choice for use in low frequency active filters in 12- and 14-bit data acquisition systems, in precision instrumentation and as a high quality integrator.

The AD705 is internally compensated for unity gain and is available in five performance grades. The AD705J and AD705K are rated over the commercial temperature range of 0°C to +70°C. The AD705A and AD705B are rated over the industrial temperature range of -40°C to +85°C. The AD705T is rated over the military temperature range of -55°C to +125°C and is available processed to MIL-STD-883B, Rev. C.

The AD705 is offered in three varieties of 8-pin package: plastic DIP, hermetic cerdip and surface mount (SOIC). “J” grade chips are also available.

### PRODUCT HIGHLIGHTS

1. The AD705 is a low drift op amp that offers BiFET level input bias currents, yet has the low  $I_B$  drift of a bipolar amplifier. It upgrades the performance of circuits using op amps such as the LT1012.
2. The combination of Analog Devices’ advanced superbeta processing technology and factory trimming provides both low drift and high dc precision.
3. The AD705 can be used in applications where a chopper amplifier would normally be required but without the chopper’s inherent noise and other problems.

## NOTES

<sup>1</sup>Bias current specifications are guaranteed maximum at either input.

All min and max specifications are guaranteed

Specifications in **boldface** are tested on all production units at final electrical test. Results from those tests are used to calculate outgoing quality levels.

Specifications subject to change without notice.

## METALIZATION PHOTOGRAPH

Dimensions shown in inches and (mm).

ABSOLUTE MAXIMUM RATINGS<sup>1</sup>

Supply Voltage . . . . .  $\pm 18$  V

Internal Power Dissipation<sup>2</sup> . . . . . 650 mW

Input Voltage . . . . .  $\pm V_S$

Differential Input Voltage<sup>3</sup> . . . . .  $\pm 0.7$  V

Output Short Circuit Duration . . . . . Indefinite

Storage Temperature Range (N, R) . . . . .  $-65^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

Storage Temperature Range (Q) . . . . .  $-65^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

Operating Temperature Range

AD705J/K . . . . .  $0^{\circ}\text{C}$  to  $+70^{\circ}\text{C}$

AD705A/B . . . . .  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$

AD705T . . . . .  $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

Lead Temperature Range (Soldering 60 sec) . . . . .  $+300^{\circ}\text{C}$

## NOTES

<sup>1</sup>Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

<sup>2</sup>Specification is for device in free air:

8-Pin Plastic Package:  $\theta_{JA} = 165^{\circ}\text{C}/\text{Watt}$

8-Pin Cerdip Package:  $\theta_{JA} = 110^{\circ}\text{C}/\text{Watt}$

8-Pin Small Outline Package:  $\theta_{JA} = 155^{\circ}\text{C}/\text{Watt}$

<sup>3</sup>The input pins of these amplifiers are protected by back-to-back diodes. If the differential voltage exceeds  $\pm 0.7$  V, external series protection resistors should be added to limit the input current to less than 25 mA.

## ORDERING GUIDE

Model	Temperature Range	Package Description	Package Option
AD705AQ	$-40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$	8-Pin Ceramic DIP	Q-8
AD705BQ	$-40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$	8-Pin Ceramic DIP	Q-8
AD705JCHIPS	$0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$	Bare Die	
AD705JN	$0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$	8-Pin Plastic DIP	N-8

AD705TQ	$-55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	8-Pin Ceramic DIP	Q-8
AD705TQ/883B	$-55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$	8-Pin Ceramic DIP	Q-8

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD705 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

### A High Performance Differential Amplifier Circuit

Figure 25 shows a high input impedance, differential amplifier circuit that features a high common-mode voltage, and which operates at low power. Table I details its performance with changes in gain. To optimize the common-mode rejection of this circuit at low frequencies and dc, apply a 1 volt, 1 Hz sine wave to both inputs. Measuring the output with an oscilloscope, adjust trimming potentiometer R6 for minimum output. For the best CMR at higher frequencies, capacitor C2 should be replaced with a 1.5 pF to 20 pF trimmer capacitor.

Both the IC socket and any standoffs at the op amp's input terminals should be made of Teflon\* to maintain low input current drift over temperature.

\*Teflon is a registered trademark of E.I. DuPont, Co.

WARNING: POTENTIAL DANGER FROM HIGH SOURCE VOLTAGE. THIS DIFFERENTIAL AMPLIFIER DOES NOT PROVIDE GALVANIC ISOLATION. INPUT SOURCE MUST BE REFERRED TO THE SAME GROUND CONNECTION AS THIS AMPLIFIER.

Figure 25. A High Performance Differentials Amplifier Circuit

Table I. Typical Performance of Differential Amplifier Circuit Operating at Various Gains

Circuit Gain	R4 (Ω)	R5 (Ω)	Trimmed DC CMR (dB)	RTI Average Drift TC ( $\mu V/^\circ C$ )	Circuit Bandwidth -3 dB
1	1.13 kΩ	10 kΩ	$\geq 85$	30	4.4 kHz
10	100 Ω	9.76 kΩ	$\geq 85$	30	2.8 kHz
100	10.2 Ω	10 kΩ	$\geq 85$	30	930 Hz

AD705

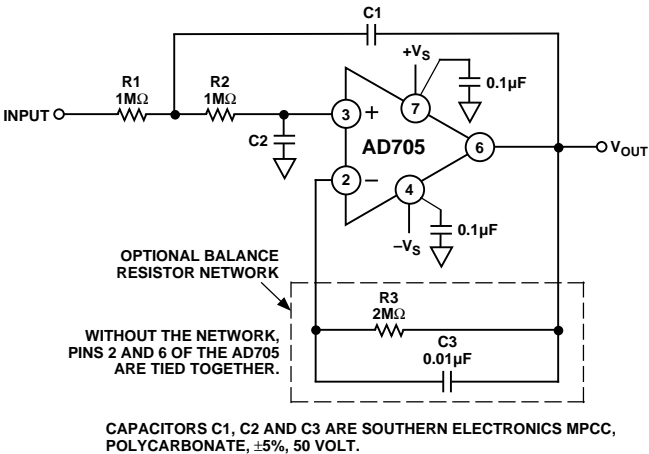

A 1 Hz, 2-Pole, Active Filter

Table II gives recommended component values for the 1 Hz filter of Figure 26. An unusual characteristic of the AD705 is that both the input bias current and the input offset current and their drift remain low over most of the op amps rated temperature range. Therefore, for most applications, there is no need to use the normal balancing resistor tied between the noninverting terminal of the op amp and ground. Eliminating the standard balancing resistor reduces board space and lowers circuit noise. However, this resistor is needed at temperatures above 110°C, because input bias current starts to change rapidly, as shown by Figure 27.

Table II. Recommended Component Values for the 1 Hz Low-Pass Filter

Desired Low Pass Response	Pole Frequency (Hz)	Pole Q	C1 Value (μF)	C2 Value (μF)
Bessel Response	1.27	0.58	0.14	0.11
Butterworth Response	1.00	0.707	0.23	0.11
0.1 dB Chebychev	0.93	0.77	0.26	0.11
0.2 dB Chebychev	0.90	0.80	0.28	0.11
0.5 dB Chebychev	0.85	0.86	0.32	0.11
1.0 dB Chebychev	0.80	0.96	0.38	0.10

Specified values are for a -3 dB point of 1.0 Hz. For other frequencies, simply scale capacitors C1 and C2 directly; i.e., for 3 Hz Bessel response, C1 = 0.046 μF, C2 = 0.037 μF.

CAPACITORS C1, C2 AND C3 ARE SOUTHERN ELECTRONICS MPCC, POLYCARBONATE, ±5%, 50 VOLT.
