ICS8430-01
HIGH FREQUENCY
SYNTHESIZER

GENERAL DESCRIPTION

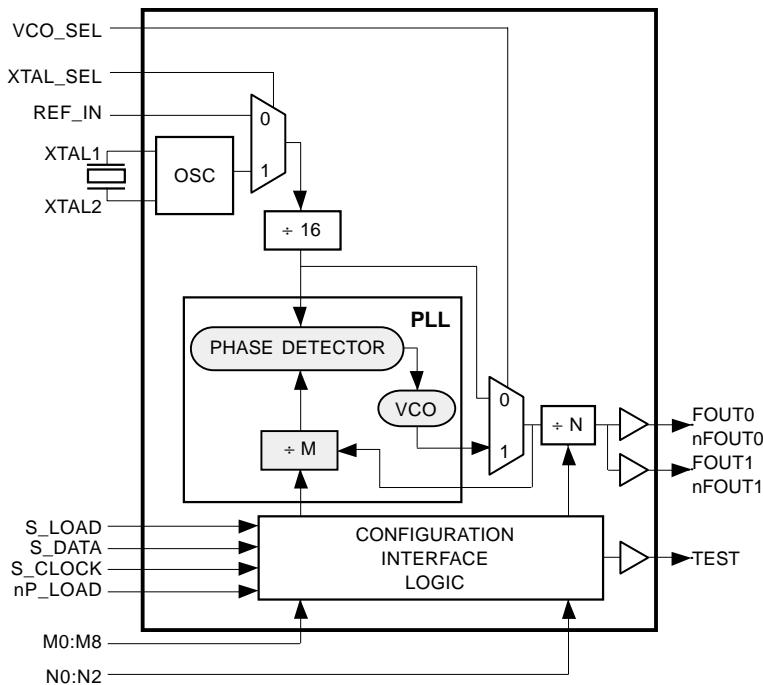

The ICS8430-01 is a general purpose, dual output high frequency synthesizer and a member of the HiPerClockS™ family of High Performance Clocks Solutions from ICS. The VCO operates at a frequency range of 280MHz to 400MHz. The output frequency can be programmed using the serial or parallel interfaces to the configuration logic. With the output configured to divide the VCO frequency by 2 output frequency steps as small as 0.5MHz can be achieved using a 16MHz crystal or reference clock.

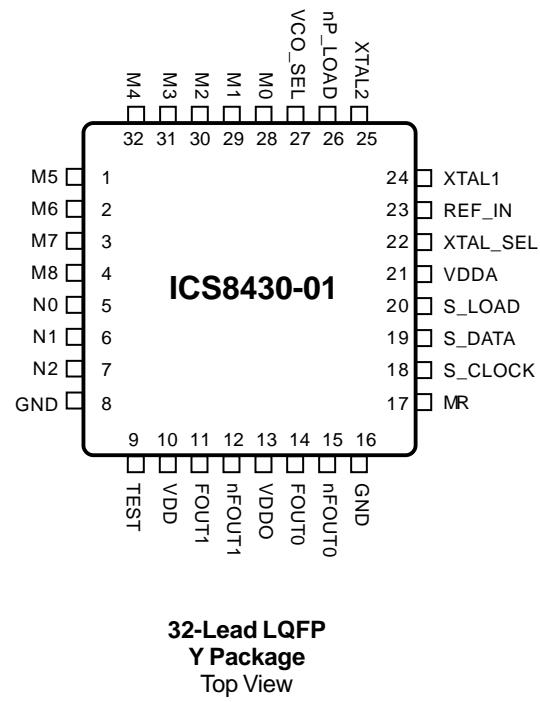

FEATURES

- Fully integrated PLL
- Dual differential 3.3V LVPECL output
- 23MHz to 400MHz output frequency
- ±25ps peak-to-peak output jitter
- Parallel interface for programming counter and output dividers during power-up
- Serial 3 wire interface
- Selectable crystal oscillator interface and LVCMS reference input
- LVCMS control inputs
- 3.3V supply voltage
- 32 lead low-profile QFP(LQFP), 7mm x 7mm x 1.4mm package body, 0.8mm package lead pitch
- 0°C to 70°C ambient operating temperature

HIGH FREQUENCY
SYNTHESIZER**

FUNCTIONAL DESCRIPTION

The ICS8430-01 features a fully integrated PLL and therefore requires no external component for setting the loop bandwidth. A series-resonant, fundamental crystal is used as the input to the on-chip oscillator. The output of the oscillator is divided by 16 prior to the phase detector. With a 16MHz crystal this provides a 1MHz reference frequency. The VCO of the PLL operates over a range of 280MHz to 400MHz. The output of the loop divider is also applied to the phase detector.

The phase detector and the loop filter force the VCO output frequency to be M times the reference frequency by adjusting the VCO control voltage. Note that for some values of M (either too high or too low) the PLL will not achieve lock. The output of the VCO is scaled by a divider prior to being sent to each of the LVPECL output buffers. The divider provides a 50% output duty cycle.

The programmable features of the ICS8430-01 support two input modes and programmable PLL loop divider and output divider. The two input operational modes are parallel and serial. Figure 1 shows the timing diagram for each mode. In parallel mode the nP_LOAD input is initially LOW. The data on inputs M0 through M8 and N0 through N2 is passed directly to the ripple counter. On the LOW-to-HIGH transition of the nP_LOAD input the data is latched and the ripple counter remains loaded until the next LOW transition on nP_LOAD or until a serial event occurs. As a result the M and N bits can be hardwired to set the ripple counter to a specific default state that will automatically occur during power-up. The TEST output is LOW when operating in the parallel input mode. The relationship between the VCO frequency, the crystal frequency and the loop divider is defined as follows:

$$f_{VCO} = \frac{f_{xtal}}{16} \times M$$

The M count and the required values of M0 through M8 are shown in Table4B, Programmable VCO Frequency Function Table. The frequency out is defined as follows:

$$f_{out} = \frac{f_{VCO}}{N} = \frac{f_{xtal}}{16} \times \frac{M}{N}$$

Serial operation occurs when nP_LOAD is HIGH and S_LOAD is LOW. The shift register is loaded by sampling the S_DATA bits with the rising edge of S_CLOCK. The contents of the shift register are loaded into the ripple counter when S_LOAD transitions from LOW-to-HIGH. The ripple counter divide values are latched on the HIGH-to-LOW transition of S_LOAD. If S_LOAD is held HIGH data at the S_DATA input is passed directly to the ripple counter on each rising edge of S_CLOCK. The serial mode can be used to program the M and N bits and test bits T1 and T0. The internal registers T0 and T1 determine the state of the TEST output as follows:

<u>T1</u>	<u>T0</u>	<u>TEST Output</u>
0	0	LOW
0	1	S_Data clocked into register
1	0	Output of M divider
1	1	CMOS Fout

TABLE 1. PIN DESCRIPTIONS

Number	Name	Type	Description
28, 29, 30 31, 32, 1, 2	M0, M1, M2 M3, M4, M5, M6	Input Pulldown	M counter/divider inputs. Data latched on LOW-to-HIGH transition of nP_LOAD input. LVCMS / LVTTL interface levels.
3, 4	M7, M8	Input Pullup	
5, 7	N0, N2	Input Pulldown	Determines output divider value as defined in Table 3 Function Table. LVCMS / LVTTL interface levels.
6	N1	Input Pullup	
8, 16	GND	Power	Power supply ground pin. Connect to ground.
9	TEST	Output	Test output which is ACTIVE in the serial mode of operation. Output driven LOW in parallel mode. LVCMS interface levels.
10	VDD	Power	Core power supply pin.
11, 12	FOUT1, nFOUT1	Output	Differential output for the synthesizer. 3.3V LVPECL interface levels.
13	VDDO	Power	Output power supply connection. Connect to 3.3V.
14, 15	FOUT0, nFOUT0	Output	Differential output for the synthesizer. 3.3V LVPECL interface levels.
17	MR	Input Pulldown	Resets the reference frequency and output dividers. Loads data present at the M bits into counter. LVCMS / LVTTL interface levels.
18	S_CLOCK	Input Pulldown	Clocks in serial data present at S_DATA input into the shift register on the rising edge of S_CLK.
19	S_DATA	Input Pulldown	Shift register serial input. Data sampled on the rising edge of S_CLK.
20	S_LOAD	Input Pulldown	Controls transition of data from shift register into the ripple counter. LVCMS / LVTTL interface levels.
21	VDDA	Power	Analog power supply pin. Connect to 3.3V.
22	XTAL_SEL	Input Pullup	Selects between crystal or reference inputs as the PLL reference source. LVCMS / LVTTL interface levels. Selects XTAL inputs when HIGH. Selects REF_IN when LOW.
23	REF_IN	Input Pulldown	Reference clock input. LVCMS / LVTTL interface levels.
24, 25	XTAL1, XTAL2	Input	Crystal oscillator inputs.
26	nP_LOAD	Input Pulldown	Parallel load input. Determines when data present at M8:M0 is loaded into ripple counter. LVCMS / LVTTL interface levels.
27	VCO_SEL	Input Pullup	Determines whether synthesizer is in PLL or bypass mode. LVCMS / LVTTL interface levels.

TABLE 2. PIN CHARACTERISTICS

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
CIN	Input Capacitance					pF
RPULLUP	Input Pullup Resistor			51		KΩ
RPULLDOWN	Input Pulldown Resistor			51		KΩ

ABSOLUTE MAXIMUM RATINGS

Supply Voltage	4.6V
Inputs	-0.5V to VDD+0.5V
Outputs	-0.5V to VDD+0.5V
Ambient Operating Temperature	0°C to 70°C
Storage Temperature	-65°C to 150°C

Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any conditions beyond those listed in the *DC Electrical Characteristics* or *AC Electrical Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

TABLE 4A. PARALLEL AND SERIAL MODES FUNCTION TABLE

INPUTS							Conditions
MR	nP_LOAD	M	N	S_LOAD	S_CLOCK	S_DATA	
H	X	X	X	X	X	X	Reset. M and N counters reset.
L	L	Data	Data	X	X	X	Data on M and N inputs passed directly to ripple counter. TEST output forced LOW.
L	↑	Data	Data	X	X	X	Data is latched into input registers and remains loaded until next LOW transition or until a serial event occurs.
L	H	X	X	L	↑	Data	Serial input mode. Shift register is loaded with data on S_DATA on each rising edge of S_CLOCK
L	H	X	X	↑	L	Data	Contents of the shift register are passed to the ripple counter.
L	H	X	X	↓	L	Data	Ripple counter divide values are latched.
L	H	X	X	L	X	X	Parallel or serial input do not affect shift registers.

PACKAGE OUTLINE AND DIMENSIONS - Y SUFFIX

NOTES:

1. ALL DIMENSIONS AND TOLERANCING CONFORM TO ANSI Y14.5-1982
2. DATUM PLANE -H- LOCATED AT MOLD PARTING LINE AND COINCIDENT WITH LEAD, WHERE LEAD EXITS PLASTIC BODY AT BOTTOM OF PARTING LINE.
3. DATUMS A-B AND -D- TO BE DETERMINED AT CENTERLINE BETWEEN LEADS WHERE LEADS EXIT PLASTIC AT DATUM PLANE -H- .
4. TO BE DETERMINED AT SEATING PLACE -C- .
5. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION.
6. "N" IS THE TOTAL NUMBER OF TERMINALS.
7. THESE DIMENSIONS TO BE DETERMINED AT DATUM PLANE -H-.
8. PACKAGE TOP DIMENSIONS ARE SMALLER THAN BOTTOM DIMENSIONS AND TOP OF PACKAGE WILL NOT OVERHANG BOTTOM OF PACKAGE.
9. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08mm TOTAL IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION.
10. CONTROLLING DIMENSION: MILLIMETER.
11. THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MS-026, VARIATION ABA.
12. A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE.
