DESCRIPTION

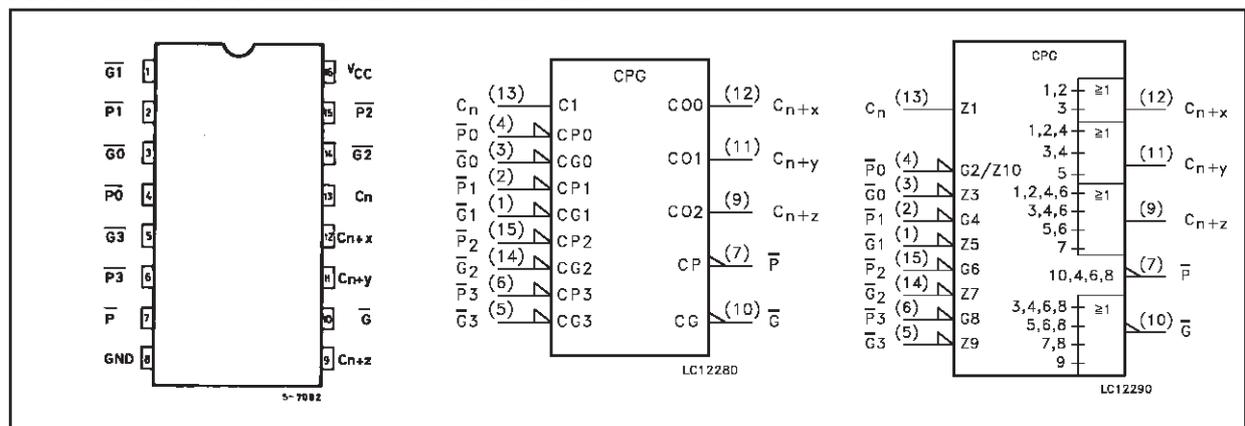

The M74HC182 is an high speed CMOS FUNCTION LOOK AHEAD CARRY GENERATOR fabricated with silicon gate C²MOS technology.

This circuit is capable of anticipating a carry across four binary adders or group of adders. It is cascadable to perform full look ahead across n-bit adders. Carry, generate-carry, and propagate-carry functions are provided as shown in the pin connection table. When used in conjunction with the HC181 arithmetic logic unit, this generator provides high speed carry look-ahead capability for any word length. Each HC182 generates the look ahead (anticipated carry) across a group of four ALU's and, in addition, other carry look-ahead circuits may be employed to anticipate carry across sections of

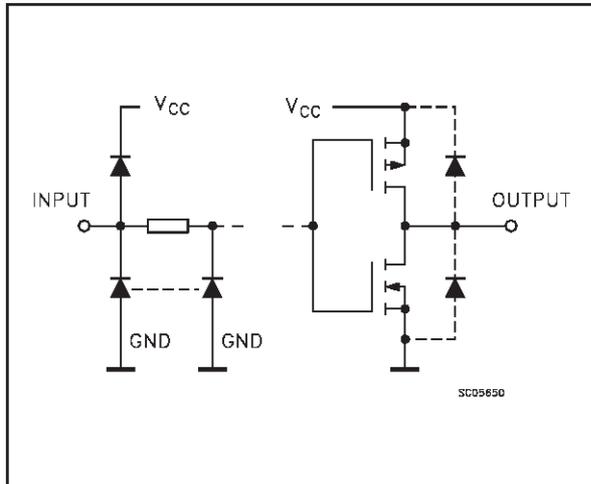

four look-ahead packages up to n-bits. The method of cascading circuits to perform multilevel look-ahead is illustrated under typical application data.

Carry input and output of the ALU's are in their true form, and the carry propagate (P) and carry generate(G) are in negated form; therefore the carry functions (inputs, outputs, generate and propagate) of the look-ahead generators are implemented in the compatible forms for direct connection to the ALU. Reinterpretation of carry functions as explained on the HC181 data sheet are also applicable to and compatible with the look-ahead generator. All inputs are equipped with protection circuits against static discharge and transient excess voltage.
