

STPC CONSUMER

PC Compatible Embedded Microprocessor

- POWERFUL X86 PROCESSOR
- 64-BIT BUS ARCHITECTURE
- 64-BIT DRAM CONTROLLER
- SVGA GRAPHICS CONTROLLER
- UMA ARCHITECTURE
- VIDEO SCALER
- DIGITAL PAL/NTSC ENCODER
- VIDEO INPUT PORT
- CRT CONTROLLER
- 135MHz RAMDAC
- 3 LINE FLICKER FILTER
- SCAN CONVERTER
- PCI MASTER / SLAVE / ARBITER CTRL
- ISA MASTER/SLAVE INTERFACE
- IDE CONTROLLER
- DMA CONTROLLER
- INTERRUPT CONTROLLER
- TIMER / COUNTERS
- POWER MANAGEMENT

STPC CONSUMER OVERVIEW

The STPC Consumer integrates a standard 5th generation x86 core, a DRAM controller, a graphics subsystem, a video pipeline and support logic including PCI, ISA and IDE controllers to provide a single Consumer orientated PC compatible sub-system on a single device.

The device is based on a tightly coupled Unified Memory Architecture (UMA), sharing the same memory array between the CPU main memory and the graphics and video frame buffers.

Extra facilities are implemented to handle video streams. Features include smooth scaling and color space conversion of the video input stream and mixing with graphics data. The chip also includes a built-in digital TV encoder and anti-flicker filters that allow stable, high-quality display on standard PAL or NTSC television sets without additional components.

The STPC Consumer is packaged in a 388 Plastic Ball Grid Array (PBGA).

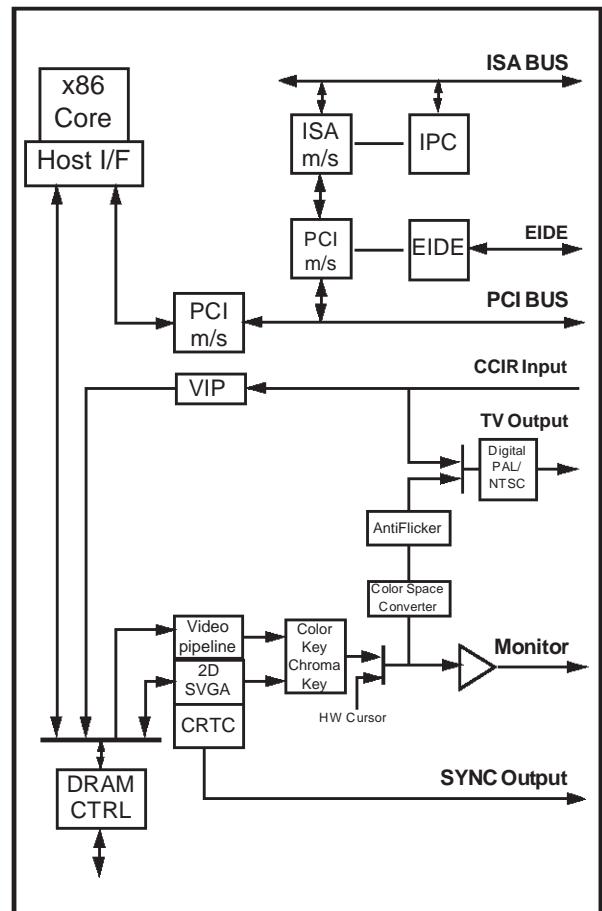

Figure 1. Logic Diagram

■ **X86 Processor core**

- Fully static 32-bit 5-stage pipeline, x86 processor fully PC compatible.
- Can access up to 4GBytes of external memory.
- 8KByte unified instruction and data cache with write back and write through capability.
- Parallel processing integral floating point unit, with automatic power down.
- Clock core speeds up to of 100 MHz.
- Fully static design for dynamic clock control.
- Low power and system management modes.
- Optimized design for 3.3V operation.

■ **DRAM Controller**

- Integrated system memory and graphic frame memory.
- Supports up to 128 MBytes system memory in 4 banks and down to as little as 2Mbytes.
- Supports 4MB, 8MB, 16MB, 32MB single-sided and double-sided DRAM SIMMs.
- Four quad-word write buffers for CPU to DRAM and PCI to DRAM cycles.
- Four 4-word read buffers for PCI masters.
- Supports Fast Page Mode & EDO DRAM.
- Programmable timing for DRAM parameters including CAS pulse width, CAS pre-charge time and RAS to CAS delay.
- 60, 70, 80 & 100ns DRAM speeds.
- Memory hole between 1 MByte & 8 MByte supported for PCI/ISA busses.
- Hidden refresh.

To check if your memory device is supported by the STPC, please refer to Table 9-3 in the Programming Manual.

■ **Graphics Engine**

- 64-bit windows accelerator.
- Backward compatibility to SVGA standards.
- Hardware acceleration for text, bitblts, transparent blts and fills.
- Up to 64 x 64 bit graphics hardware cursor.
- Up to 4MB long linear frame buffer.
- 8-, 16-, and 24-bit pixels.
- Drivers for Windows and other operating systems.

■ **VGA Controller**

- Integrated 135MHz triple RAMDAC allowing for 1280 x 1024 x 75Hz display.
- Requires external frequency synthesizer and reference sources.
- 8-, 16-, 24-bit pixels.
- Interlaced or non-interlaced output.
- **Video Input port**
- Accepts video inputs in CCIR 601/656 or ITU-R 601/656, and stream decoding.
- Optional 2:1 decimator
- Stores captured video in off setting area of the onboard frame buffer.
- Video pass through to the onboard PAL/NTSC encoder for full screen video images.
- HSYNC and B/T generation or lock onto external video timing source.

■ **Video Pipeline**

- Two-tap interpolative horizontal filter.
- Two-tap interpolative vertical filter.
- Color space conversion (RGB to YUV and YUV to RGB).
- Programmable window size.
- Chroma and color keying for integrated video overlay.
- Programmable two tap filter with gamma correction or three tap flicker filter.
- Progressive to interlaced scan converter.

■ **Digital NTSC/PAL encoder**

- NTSC-M, PAL-M, PAL-B,D,G,H,I, PAL-N easy programmable video outputs.
- CCIR601 encoding with programmable color subcarrier frequencies.
- Line skip/insert capability
- Interlaced or non-interlaced operation mode.
- 625 lines/50Hz or 525 lines/60Hz 8 bit multiplexed CB-Y-CR digital input.
- CVBS and R,G,B simultaneous analog outputs through 10-bit DACs.
- Cross color reduction by specific trap filtering on luma within CVBS flow.
- Power down mode available on each DAC.

- **PCI Controller**
- Fully compliant with PCI 2.1 specification.
- Integrated PCI arbitration interface. Up to 3 masters can connect directly. External PAL allows for greater than 3 masters.
- Translation of PCI cycles to ISA bus.
- Translation of ISA master initiated cycle to PCI.
- Support for burst read/write from PCI master.
- 0.33X and 0.5X CPU clock PCI clock.

- **ISA master/slave Interface**
- Generates the ISA clock from either 14.318MHz oscillator clock or PCI clock
- Supports programmable extra wait state for ISA cycles
- Supports I/O recovery time for back to back I/O cycles.
- Fast Gate A20 and Fast reset.
- Supports the single ROM that C, D, or E. blocks shares with F block BIOS ROM.
- Supports flash ROM.
- Supports ISA hidden refresh.
- Buffered DMA & ISA master cycles to reduce bandwidth utilization of the PCI and Host bus. NSP compliant.

- **IDE Interface**
- Supports PIO
- Supports up to Mode 5 Timings
- Transfer Rates to 22 MBytes/sec
- Supports up to 4 IDE devices

- Concurrent channel operation (PIO modes) - 4 x 32-Bit Buffer FIFOs per channel
- Support for PIO mode 3 & 4.
- Support for 11.1/16.6 MB/s, I/O Channel Ready PIO data transfers.
- Individual drive timing for all four IDE devices
- Supports both legacy & native IDE modes
- Supports hard drives larger than 528MB
- Support for CD-ROM and tape peripherals
- Backward compatibility with IDE (ATA-1).
- Drivers for Windows and other Operating Systems

- **Integrated peripheral controller**
- 2X8237/AT compatible 7-channel DMA controller.
- 2X8259/AT compatible interrupt Controller. 16 interrupt inputs - ISA and PCI.
- Three 8254 compatible Timer/Counters.
- Co-processor error support logic.

- **Power Management**
- Four power saving modes: On, Doze, Standby, Suspend.
- Programmable system activity detector
- Supports SMM and APM.
- Supports STOPCLK.
- Supports IO trap & restart.
- Independent peripheral time-out timer to monitor hard disk, serial & parallel ports.
- Supports RTC, interrupts and DMAs wake-up

UPDATE HISTORY FOR OVERVIEW.

0.1 UPDATE HISTORY FOR OVERVIEW.

The following changes have been made to the Electrical Specification Chapter on the 02/02/2000.

Section	Change	Text
	Added	To check if your memory device is supported by the STPC, please refer to Table 9-3 Host Address to MA Bus Mapping in the Programming Manual.

1. GENERAL DESCRIPTION

At the heart of the STPC Consumer is an advanced processor block, dubbed the 5ST86. The 5ST86 includes a powerful x86 processor core along with a 64-bit DRAM controller, advanced 64bit accelerated graphics and video controller, a high speed PCI local-bus controller and Industry standard PC chip set functions (Interrupt controller, DMA Controller, Interval timer and ISA bus) and EIDE controller.

The STPC Consumer has in addition to the 5ST86, a Video subsystem and high quality digital Television output.

The STMicroelectronics x86 processor core is embedded with standard and application specific peripheral modules on the same silicon die. The core has all the functionality of the STMicroelectronics standard x86 processor products, including the low power System Management Mode (SMM).

System Management Mode (SMM) provides an additional interrupt and address space that can be used for system power management or software transparent emulation of peripherals. While running in isolated SMM address space, the SMM interrupt routine can execute without interfering with the operating system or application programs.

Further power management facilities include a suspend mode that can be initiated from either hardware or software. Because of the static nature of the core, no internal data is lost.

The STPC Consumer makes use of a tightly coupled Unified Memory Architecture (UMA), where the same memory array is used for CPU main memory and graphics frame-buffer. This significantly reduces total system memory with system performances equal to that of a comparable solution with separate frame buffer and system memory. In addition, memory bandwidth is improved by attaching the graphics engine directly to the 64-bit processor host interface running at the speed of the processor bus rather than the traditional PCI bus.

The 64-bit wide memory array provides the system with 320MB/s peak bandwidth, double that of an equivalent system using 32 bits. This allows for higher screen resolutions and greater color depth. The processor bus runs at the speed of the processor (DX devices) or half the speed (DX2 devices).

The 'standard' PC chipset functions (DMA, interrupt controller, timers, power management logic) are integrated with the x86 processor core.

The PCI bus is the main data communication link to the STPC Consumer chip. The STPC Consumer translates appropriate host bus I/O and Memory cycles onto the PCI bus. It also supports the generation of Configuration cycles on the PCI bus. The STPC Consumer, as a PCI bus agent (host bridge class), fully complies with PCI specification 2.1. The chip-set also implements the PCI mandatory header registers in Type 0 PCI configuration space for easy porting of PCI aware system BIOS. The device contains a PCI arbitration function for three external PCI devices.

The STPC Consumer integrates an ISA bus controller. Peripheral modules such as parallel and serial communications ports, keyboard controllers and additional ISA devices can be accessed by the STPC Consumer chip set through this bus.

An industry standard EIDE (ATA 2) controller is built in to the STPC Consumer and connected internally via the PCI bus.

Graphics functions are controlled by the on-chip SVGA controller and the monitor display is managed by the 2D graphics display engine.

This Graphics Engine is tuned to work with the host CPU to provide a balanced graphics system with a low silicon area cost. It performs limited graphics drawing operations, which include hardware acceleration of text, bitblts, transparent blts and fills. These operations can act on off-screen or on-screen areas. The frame buffer size ranges up to 4 Mbytes anywhere in the physical main memory.

The graphics resolution supported is a maximum of 1280x1024 in 65536 colours at 75Hz refresh rate and is VGA and SVGA compatible. Horizontal timing fields are VGA compatible while the vertical fields are extended by one bit to accommodate the above display resolution.

STPC Consumer provides several additional functions to handle MPEG or similar video streams. The Video Input Port accepts an encoded digital video stream in one of a number of industry standard formats, decodes it, optionally decimates it by a factor of 2:1, and deposits it into an off screen area of the frame buffer. An interrupt request can be generated when an entire field or frame has been captured.

The video output pipeline incorporates a video-scaler and color space converter function and provisions in the CRT controller to display a video window. While repainting the screen the CRT controller fetches both the video as well as the normal non-video frame buffer in two separate internal FIFOs (256-Bytes each). The video stream can be color-space converted (optionally) and smooth scaled. Smooth interpolative scaling in both horizontal and vertical directions are implemented. Color and Chroma key functions are also implemented to allow mixing video stream with non-video frame buffer.

The video output passes directly to the RAMDAC for monitor output or through another optional color space converter (RGB to 4:2:2 YCrCb) to the programmable anti-flicker filter. The flicker filter is configured as either a two line filter with gamma correction (primarily designed for DOS type text) or a 3 line flicker filter (primarily designed for Windows type displays). The flicker filter is optional and can be software disabled for use with video on large screen areas.

The Video output pipeline of the STPC Consumer interfaces directly to the internal digital TV encoder. It takes a 24 bit RGB non-interlaced pixel stream and converts to a multiplexed 4:2:2 YCrCb 8 bit output stream, the logic includes a progressive to interlaced scan converter and logic to insert appropriate CCIR656 timing reference codes into the output stream. It facilitates the high quality display of VGA or full screen video streams received via the Video input port to standard NTSC or PAL televisions.

The STPC Consumer core is compliant with the Advanced Power Management (APM) specification to provide a standard method by which the BIOS can control the power used by personal computers. The Power Management Unit module (PMU) controls the power consumption by providing a comprehensive set of features that control the power usage and supports compliance with the United States Environmental Protection Agency's Energy Star Computer Program. The PMU provides following hardware structures to assist the software in managing the power consumption by the system.

- System Activity Detection.
- 3 power-down timers detecting system inactivity:
 - Doze timer (short durations).
 - Stand-by timer (medium durations).
 - Suspend timer (long durations).
- House-keeping activity detection.

- House-keeping timer to cope with short bursts of house-keeping activity while dozing or in stand-by state.

- Peripheral activity detection.

- Peripheral timer detecting peripheral inactivity

- SUSP# modulation to adjust the system performance in various power down states of the system including full power on state.

- Power control outputs to disable power from different planes of the board.

Lack of system activity for progressively longer period of times is detected by the three power down timers. These timers can generate SMI interrupts to CPU so that the SMM software can put the system in decreasing states of power consumption. Alternatively, system activity in a power down state can generate SMI interrupt to allow the software to bring the system back up to full power on state. The chip-set supports up to three power down states: Doze state, Stand-by state and Suspend mode. These correspond to decreasing levels of power savings.

Power down puts the STPC Consumer into suspend mode. The processor completes execution of the current instruction, any pending decoded instructions and associated bus cycles. During the suspend mode, internal clocks are stopped. Removing power down, the processor resumes instruction fetching and begins execution in the instruction stream at the point it had stopped.

A reference design for the STPC Consumer is available including the schematics and layout files, the design is a PC ATX motherboard design. The design is available as a demonstration board for application and system development.

The STPC Consumer is supported by several BIOS vendors, including the super I/O device used in the reference design. Drivers for 2D accelerator, video features and EIDE are available on various operating systems.

The STPC Consumer has been designed using modern reusable modular design techniques, it is possible to add or remove the standard features of the STPC Consumer or other variants of the 5ST86 family. Contact your local STMicroelectronics sales office for further information.

GENERAL DESCRIPTION

Figure 1-1 Functionnal description

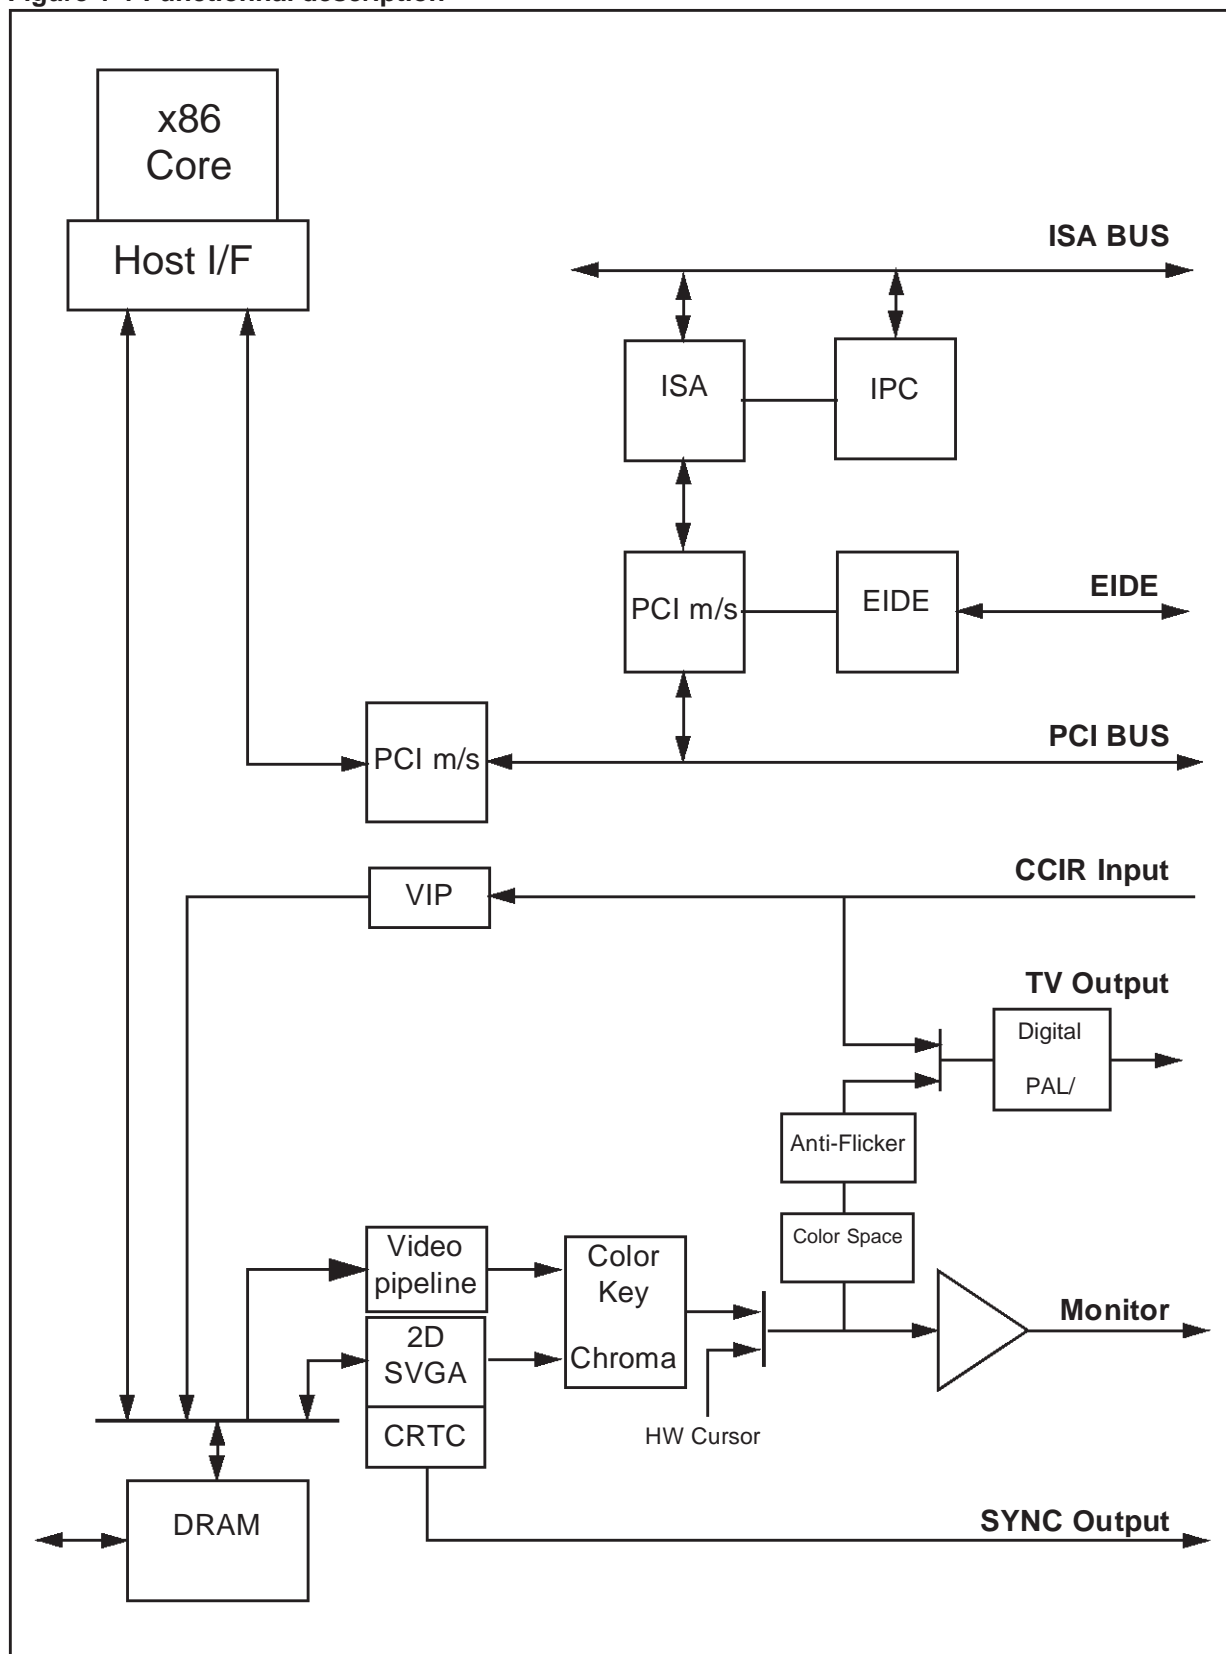

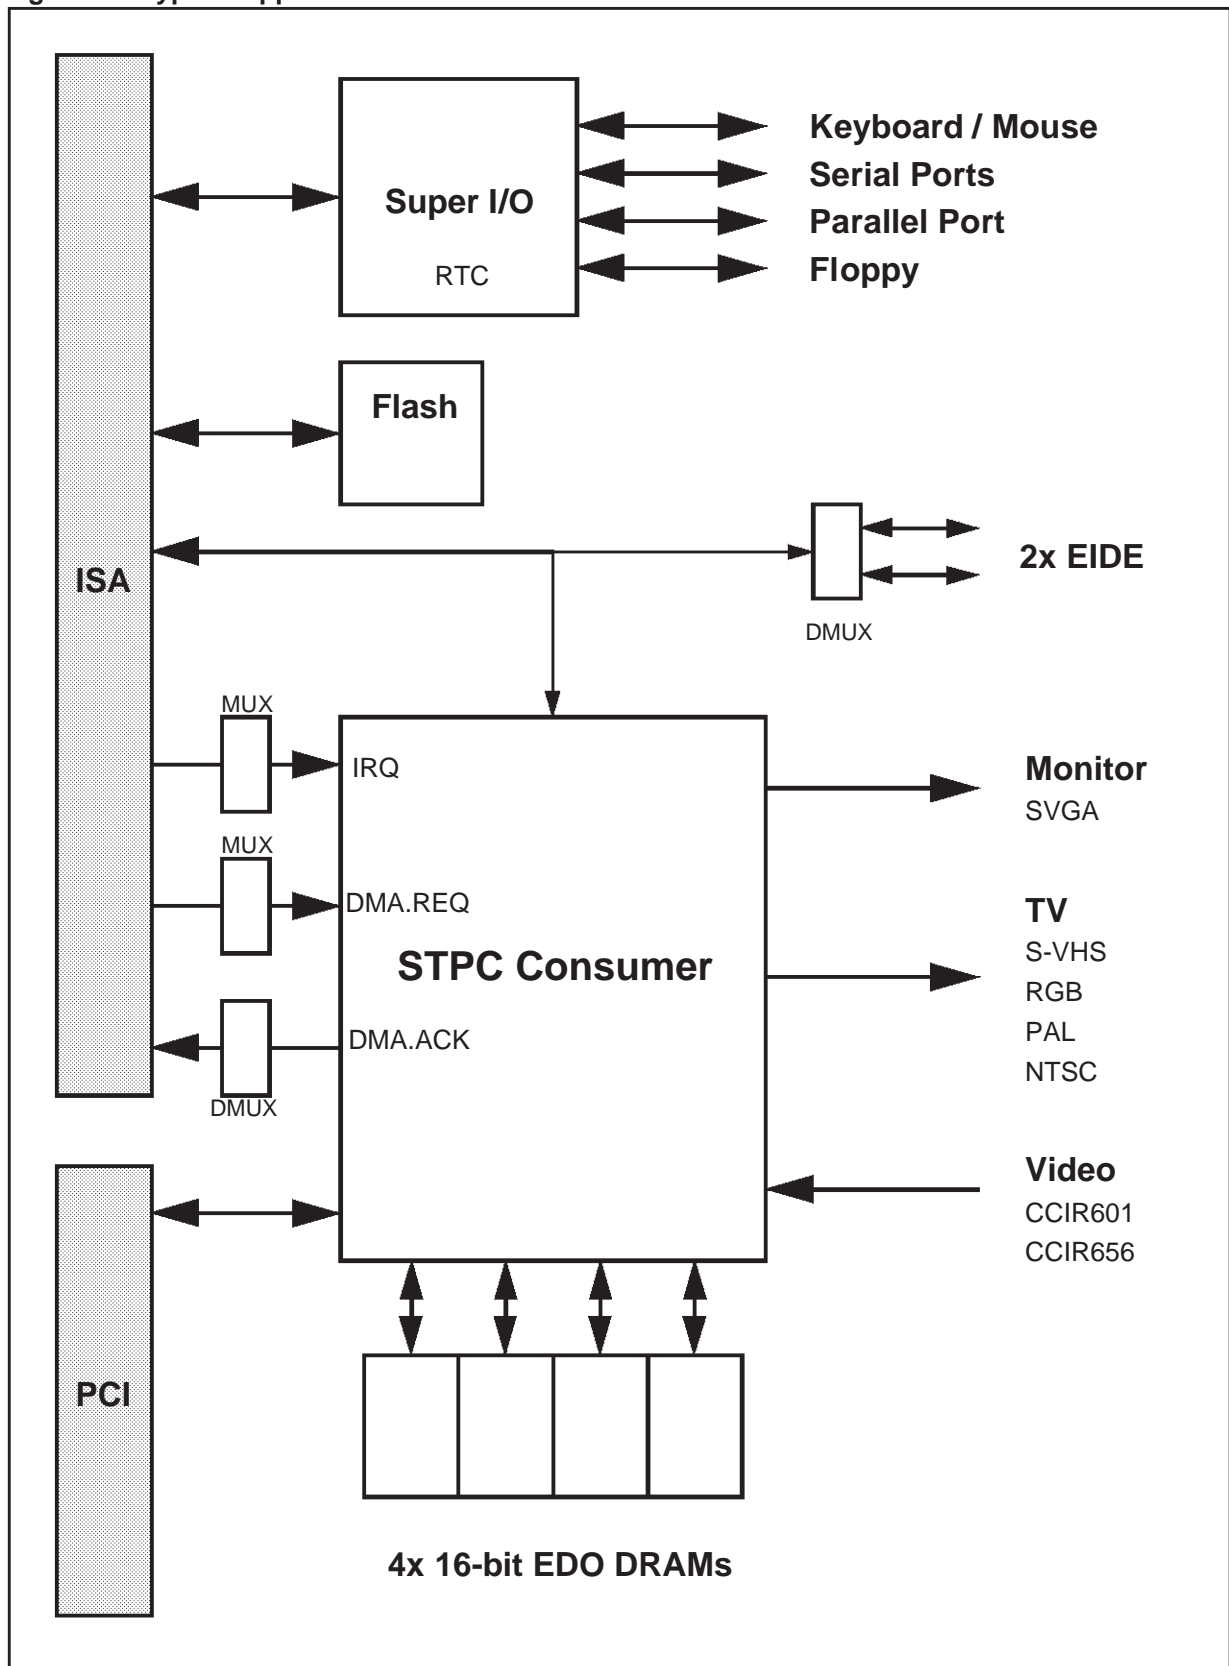

Figure 1-2 Typical Application

2. PIN DESCRIPTION

2.1 INTRODUCTION

The STPC Consumer integrates most of the functionalities of the PC architecture. As a result, many of the traditional interconnections between the host PC microprocessor and the peripheral devices are totally internal to the STPC Consumer. This offers improved performance due to the tight coupling of the processor core and these peripherals. As a result many of the external pin connections are made directly to the on-chip peripheral functions.

Figure 2-1 shows the STPC Consumer's external interfaces. It defines the main busses and their function. Table 2-1 describes the physical implementation listing signal types and their functionalities. Table 2-2 provides a full pin listing and description. Table 2-3 provides a full listing of the STPC Consumer pin locations of package by physical connection. Please refer to the pin allocation drawing for reference.

2.2 SIGNAL DESCRIPTIONS

2.2.1 BASIC CLOCKS AND RESETS

SYSRSTI *System Reset/Power good.* This input is low when the reset switch is depressed. Otherwise, it reflects the power supply's power good signal. SYSRSTI is asynchronous to all clocks, and acts as a negative active reset. The reset circuit initiates a hard reset on the rising edge of SYSRSTI.

SYSRSTO# *Reset Output to System.* This is the system reset signal and is used to reset the rest of the components (not on Host bus) in the system. The ISA bus reset is an externally inverted buffered version of this output and the PCI bus reset is an externally buffered version of this output.

XTALI *14.3MHz Crystal Input*

XTALO *14.3MHz Crystal Output.* These pins are the 14.318 MHz crystal input; This clock is used as the reference clock for the internal frequency synthesizer to generate the HCLK, CLK24M, GCLK2X and DCLK clocks.

A 14.318 MHz Series Cut Quartz Crystal should be connected between these two pins. Balance capacitors of 15 pF should also be added. In the event of an external oscillator providing the master clock signal to the STPC Consumer device, the TTL signal should be provided on XTALO.

HCLK *Host Clock.* This is the host 1X clock. Its frequency can vary from 25 to 75 MHz. All host transactions and PCI transactions are synchronized to this clock. The DRAM controller to execute the host transactions is also driven by this clock. In normal mode, this output clock is generated by the internal pll.

GCLK2X *80MHz Graphics Clock.* This is the Graphics 2X clock, which drives the graphics engine and the DRAM controller to execute the graphics and display cycles.

Normally GCLK2X is generated by the internal frequency synthesizer, and this pin is an output. By setting a bit in Strap Register 2, this pin can be made an input so that an external clock can replace the internal frequency synthesizer.

PCI_CLKI *33MHz PCI Input Clock*

This signal is the PCI bus clock input and should be driven from the PCI_CLKO pin.

PCI_CLKO *33MHz PCI Output Clock.* This is the master PCI bus clock output.

DCLK *135MHz Dot Clock.* This is the dot clock, which drives graphics display cycles. Its frequency can go from 8MHz (using internal PLL) up to 135 MHz, and it is required to have a worst case duty cycle of 60-40.

This signal is either driven by the internal pll (VGA) or an external 27MHz oscillator (when the composite video output is enabled). The direction can be controlled by a strap option or an internal register bit.

ISA_CLK *ISA Clock Output (also Multiplexer Select Line For IPC).* This pin produces the Clock signal for the ISA bus. It is also used with ISA_CLK2X as the multiplexor control lines for the Interrupt Controller Interrupt input lines. This is a divided down version of either the PCICLK or OSC14M.

ISA_CLKX2 *ISA Clock Output (also Multiplexer Select Line For IPC).* This pin produces a signal that is twice the frequency of the ISA bus Clock signal. It is also used with ISA_CLK as the multiplexor control lines for the Interrupt Controller input lines.

DEV_CLK *24MHz Peripheral Clock Output.* This 24MHz signal is provided as a convenience for the system integration of a Floppy Disk driver function in an external chip.

OSC14M *ISA bus synchronisation clock Output.* This is the buffered 14.318 Mhz clock to the ISA bus.

2.2.2 MEMORY INTERFACE

MA[11:0] *Memory Address Output.* These 12 multiplexed memory address pins support external DRAM with up to 4K refresh. These include all 16M x N and some 4M x N DRAM modules. The address signals must be externally buffered to support more than 16 DRAM chips. The timing of these signals can be adjusted by software to match the timings of most DRAM modules.

MD[63:0] *Memory Data I/O.* This is the 64-bit memory data bus. If only half of a bank is populated, MD63-32 is pulled high, data is on MD31-0. MD[40-0] are read by the device strap option registers during rising edge of SYSRSTI.

RAS#[3:0] *Row Address Strobe Output.* There are 4 active low row address strobe outputs, one for each bank of the memory. Each bank contains 4 or 8-Bytes of data. The memory controller allows half of a bank (4-bytes) to be populated to enable memory upgrade at finer granularity. The RAS# signals drive the SIMMs directly without any external buffering. These pins are always outputs, but they can also simultaneously be inputs, to allow the memory controller to monitor the value of the RAS# signals at the pins.

CAS#[7:0] *Column Address Strobe Output.* There are 8 active low column address strobe outputs, one each for each byte of the memory. The CAS# signals drive the SIMMs either directly or through external buffers. These pins are always outputs, but they can also simultaneously be inputs, to allow the memory controller to monitor the value of the CAS# signals at the pins.

MWE# *Write Enable Output.* Write enable specifies whether the memory access is a read (MWE# = H) or a write (MWE# = L). This single write enable controls all the DRAM. It can be externally buffered to boost the maximum number of loads (DRAM chips) supported. The MWE# signals drive the SIMMs directly without any external buffering.

2.2.3 VIDEO INTERFACE

VCLK *Pixel Clock Input.*

VIN[7:0] *YUV Video Data Input CCIR 601 or 656.* Time multiplexed 4:2:2 luminance and chrominance data as defined in ITU-R Rec601-2 and Rec656 (except for TTL input levels). This bus interfaces with an MPEG video decoder output port and typically carries a stream of Cb,Y,Cr,Y digital video at VCLK frequency, clocked on the rising edge (by default) of VCLK. A 54-Mbit/s 'double' Cb, Y, Cr, Y input multiplex is supported for double encoding application (rising and falling edge of CKREF are operating).

2.2.4 TV OUTPUT

RED_TV / C_TV *Analog video outputs synchronized with CVBS.* This output is current-driven and must be connected to analog ground over a load resistor (R_{LOAD}). Following the load resistor, a

simple analog low pass filter is recommended. In S-VHS mode, this is the Chrominance Output.

GREEN_TV / Y_TV *Analog video outputs synchronized with CVBS.* This output is current-driven and must be connected to analog ground over a load resistor (R_{LOAD}). Following the load resistor, a simple analog low pass filter is recommended. In S-VHS mode, this is the Luminance Output.

BLUE_TV / CVBS *Analog video outputs synchronized with CVBS.* This output is current-driven and must be connected to analog ground over a load resistor (R_{LOAD}). Following the load resistor, a simple analog low pass filter is recommended. In S-VHS mode, this is a second composite output.

VCS *Line synchronisation Output.* This pin is an input in ODDEV+HSYNC or VSYNC + HSYNC or VSYNC slave modes and an output in all other modes (master/slave). The signal is synchronous to rising edge of CK-REF. The default polarity uses a negative pulse

ODD_EVEN *Frame Synchronisation Output.* This pin supports the Frame synchronisation signal. It is an input in slave modes, except when sync is extracted from YCrCb data, and an output in master mode and when sync is extracted from YCrCb data. The signal is synchronous to rising edge of DCLK. The default polarity for this pin is:
- odd (not-top) field : LOW level
- even (bottom) field : HIGH level

IREF1_TV *Ref. current* for CVBS 10-bit DAC.

VREF1_TV *Ref. voltage* for CVBS 10-bit DAC.

IREF2_TV *Reference current* for RGB 9-bit DAC.

VREF2_TV *Reference voltage* for RGB 9-bit DAC.

VSSA_TV *Analog V_{SS} for DAC*

VDDA_TV *Analog V_{DD} for DAC*

CVBS *Analog video composite output (luminance/chrominance).* CVBS is current-driven and must be connected to analog ground over a load resistor (R_{LOAD}). Following the load resistor, a simple analog low pass filter is recommended.

2.2.5 PCI INTERFACE

AD[31:0] *PCI Address/Data.* This is the 32-bit multiplexed address and data bus of the PCI. This bus is driven by the master during the address phase and data phase of write transactions. It is

PIN DESCRIPTION

driven by the target during data phase of read transactions.

CBE#[3:0] *Bus Commands/Byte Enables*. These are the multiplexed command and byte enable signals of the PCI bus. During the address phase they define the command and during the data phase they carry the byte enable information. These pins are inputs when a PCI master other than the STPC Consumer owns the bus and outputs when the STPC Consumer owns the bus.

FRAME# *Cycle Frame*. This is the frame signal of the PCI bus. It is an input when a PCI master owns the bus and is an output when STPC Consumer owns the PCI bus.

TRDY# *Target Ready*. This is the target ready signal of the PCI bus. It is driven as an output when the STPC Consumer is the target of the current bus transaction. It is used as an input when STPC Consumer initiates a cycle on the PCI bus.

IRDY# *Initiator Ready*. This is the initiator ready signal of the PCI bus. It is used as an output when the STPC Consumer initiates a bus cycle on the PCI bus. It is used as an input during the PCI cycles targeted to the STPC Consumer to determine when the current PCI master is ready to complete the current transaction.

STOP# *Stop Transaction*. Stop is used to implement the disconnect, retry and abort protocol of the PCI bus. It is used as an input for the bus cycles initiated by the STPC Consumer and is used as an output when a PCI master cycle is targeted to the STPC Consumer.

DEVSEL# *I/O Device Select*. This signal is used as an input when the STPC Consumer initiates a bus cycle on the PCI bus to determine if a PCI slave device has decoded itself to be the target of the current transaction. It is asserted as an output either when the STPC Consumer is the target of the current PCI transaction or when no other device asserts DEVSEL# prior to the subtractive decode phase of the current PCI transaction.

PAR *Parity Signal Transactions*. This is the parity signal of the PCI bus. This signal is used to guarantee even parity across AD[31:0], CBE#[3:0], and PAR. This signal is driven by the master during the address phase and data phase of write transactions. It is driven by the target during data phase of read transactions. (Its assertion is identical to that of the AD bus delayed by one PCI clock cycle)

SERR# *System Error*. This is the system error signal of the PCI bus. It may, if enabled, be asserted for one PCI clock cycle if target aborts a STPC Consumer initiated PCI transaction. Its assertion by either the STPC Consumer or by another PCI bus agent will trigger the assertion of NMI to the host CPU. This is an open drain output.

LOCK# *PCI Lock*. This is the lock signal of the PCI bus and is used to implement the exclusive bus operations when acting as a PCI target agent.

PCIREQ#[2:0] *PCI Request*. This pin are the three external PCI master request pins. They indicate to the PCI arbiter that the external agents desire use of the bus.

PCIGNT#[2:0] *PCI Grant*. These pins indicate that the PCI bus has been granted to the master requesting it on its PCIREQ#.

2.2.6 ISA/IDE COMBINED ADDRESS/DATA

LA[23]/SCS3# *Unlatched Address (ISA)/Secondary Chip Select (IDE)*. This pin has two functions, depending on whether the ISA bus is active or the IDE bus is active.

When the ISA bus is active, this pins is ISA Bus unlatched address bit 23 for 16-bit devices. When ISA bus is accessed by any cycle initiated from PCI bus, this pin is in output mode. When an ISA bus master owns the bus, this pins is in input mode.

When the IDE bus is active, this signals is used as the active high secondary slave IDE chip select signal. This signal is to be externally NANDed with the ISAOE# signal before driving the IDE devices to guarantee it is active only when ISA bus is idle.

LA[22]/SCS1# *Unlatched Address (ISA)/Secondary Chip Select (IDE)*

This pin has two functions, depending on whether the ISA bus is active or the IDE bus is active.

When the ISA bus is active, this pins is ISA Bus unlatched address bit 22 for 16-bit devices. When ISA bus is accessed by any cycle initiated from PCI bus, this pin is in output mode. When an ISA bus master owns the bus, this pins is in input mode.

When the IDE bus is active, this signals is used as the active high secondary slave IDE chip select signal. This signal is to be externally ANDed with the ISAOE# signal before driving the IDE devices to guarantee it is active only when ISA bus is idle.

LA[21]/PCS3# *Unlatched Address (ISA)/Primary Chip Select (IDE)*. This pin has two functions, depending on whether the ISA bus is active or the IDE bus is active.

When the ISA bus is active, this pins is ISA Bus unlatched address bit 21 for 16-bit devices. When ISA bus is accessed by any cycle initiated from PCI bus, this pin is in output mode. When an ISA-bus master owns the bus, this pins is in input mode.

When the IDE bus is active, this signals is used as the active high primary slave IDE chip select signal. This signal is to be externally NANDed with the ISAOE# signal before driving the IDE devices to guarantee it is active only when ISA bus is idle.

LA[20]/PCS1# *Unlatched Address (ISA)/Primary Chip Select (IDE)*. This pin has two functions, depending on whether the ISA bus is active or the IDE bus is active.

When the ISA bus is active, this pins is ISA Bus unlatched address bit 20 for 16-bit devices. When ISA bus is accessed by any cycle initiated from PCI bus, this pin is in output mode. When an ISA bus master owns the bus, this pins is in input mode.

When the IDE bus is active, this signals is used as the active high primary slave IDE chip select signal. This signal is to be externally NANDed with the ISAOE# signal before driving the IDE devices to guarantee it is active only when ISA bus is idle.

LA[19:17]/DA[2:0] *Unlatched Address (ISA)/Address (IDE)*. These pins are multi-function pins. They are used as the ISA bus unlatched address bits [19:17] for ISA bus or the three address bits for the IDE bus devices.

When used by the ISA bus, these pins are ISA Bus unlatched address bits 19-17 on 16-bit devices. When ISA bus is accessed by any cycle initiated from the PCI bus, these pins are in output mode. When an ISA bus master owns the bus, these pins are tristated.

For IDE devices, these signals are used as the DA[2:0] and are connected to DA[2:0] of IDE devices directly or through a buffer. If the toggling of signals are to be masked during ISA bus cycles, they can be externally ORed before being connected to the IDE devices.

SA[19:8]/DD[11:0] *Unlatched Address (ISA)/Data Bus (IDE)*. These are multifunction pins. When the ISA bus is active, they are used as the ISA bus system address bits 19-8. When the IDE bus is active, they serve as IDE signals DD[11:0].

These pins are used as an input when an ISA bus master owns the bus and are outputs at all other times.

IDE devices are connected to SA[19:8] directly and ISA bus is connected to these pins through two LS245 transceivers. The \overline{OE} of the transceivers are connected to ISAOE# and DIR is connected to MASTER#. A bus signals of the transceivers are connected to CPC and IDE DD bus and B bus signals are connected to ISA SA bus.

DD[15:12] *Databus (IDE)*. The high 4 bits of the IDE databus are combined with several of the X-bus lines. Refer to the following section for X-bus pins for further information.**SA[7:0]** *ISA Bus address bits [7:0]*. These are the 8 low bits of the system address bus of ISA on 8-bit slot. These pins are used as an input when an ISA bus master owns the bus and are outputs at all other times.**SD[15:0]** *I/O Data Bus (ISA)*. These pins are the external databus to the ISA bus.

PIN DESCRIPTION

2.2.7 ISA/IDE COMBINED CONTROL

IOCHRDY/DIORDY *Channel Ready (ISA)/Busy/Ready (IDE)*. This is a multi-function pin. When the ISA bus is active, this pin is IOCHRDY. When the IDE bus is active, this serves as IDE signal DIORDY.

IOCHRDY is the IO channel ready signal of the ISA bus and is driven as an output in response to an ISA master cycle targeted to the host bus or an internal register of the STPC Consumer. The STPC Consumer monitors this signal as an input when performing an ISA cycle on behalf of the host CPU, DMA master or refresh.

ISA masters which do not monitor IOCHRDY are not guaranteed to work with the STPC Consumer since the access to the system memory can be considerably delayed due to CRT refresh or a write back cycle.

2.2.8 ISA CONTROL

ALE *Address Latch Enable*. This is the address latch enable output of the ISA bus and is asserted by the STPC Consumer to indicate that LA23-17, SA19-0, AEN and SBHE# signals are valid. The ALE is driven high during refresh, DMA master or an ISA master cycles by the STPC Consumer. ALE is driven low after reset.

BHE# *System Bus High Enable*. This signal, when asserted, indicates that a data byte is being transferred on SD15-8 lines. It is used as an input when an ISA master owns the bus and is an output at all other times.

MEMR# *Memory Read*. This is the memory read command signal of the ISA bus. It is used as an input when an ISA master owns the bus and is an output at all other times. The MEMR# signal is active during refresh.

MEMW# *Memory Write*. This is the memory write command signal of the ISA bus. It is used as an input when an ISA master owns the bus and is an output at all other times.

SMEMR# *System Memory Read*. The STPC Consumer generates SMEMR# signal of the ISA bus only when the address is below one megabyte or the cycle is a refresh cycle.

SMEMW# *System Memory Write*. The STPC Consumer generates SMEMW# signal of the ISA bus only when the address is below one megabyte. This signal is multiplexed with COL_CMP on the VGA Interface. The signal is selected by setting Strap Option MD[0] as described in Section 3.

IOR# *I/O Read*. This is the IO read command signal of the ISA bus. It is an input when an ISA master owns the bus and is an output at all other times.

IOW# *I/O Write*. This is the IO write command signal of the ISA bus. It is an input when an ISA master owns the bus and is an output at all other times.

MASTER# *Add On Card Owns Bus*. This signal is active when an ISA device has been granted bus ownership.

MCS16# *Memory Chip Select16*. This is the decode of LA23-17 address pins of the ISA address bus without any qualification of the command signal lines. MCS16# is always an input. The STPC Consumer ignores this signal during IO and refresh cycles.

IOCS16# *IO Chip Select16*. This signal is the decode of SA15-0 address pins of the ISA address bus without any qualification of the command signals. The STPC Consumer does not drive IOCS16# (similar to PC-AT design). An ISA master access to an internal register of the STPC Consumer is executed as an extended 8-bit IO cycle.

REF# *Refresh Cycle*. This is the refresh command signal of the ISA bus. It is driven as an output when the STPC Consumer performs a refresh cycle on the ISA bus. It is used as an input when an ISA master owns the bus and is used to trigger a refresh cycle.

The STPC Consumer performs a pseudo hidden refresh. It requests the host bus for two host clocks to drive the refresh address and capture it in external buffers. The host bus is then relinquished while the refresh cycle continues on the ISA bus.

AEN *Address Enable*. Address Enable is enabled when the DMA controller is the bus owner to indicate that a DMA transfer will occur. The enabling of the signal indicates to IO devices to ignore the IOR#/IOW# signal during DMA transfers.

ZWS# *Zero Wait State*. This signal, when asserted by addressed device, indicates that current cycle can be shortened.

IOCHCK# *IO Channel Check*. IO Channel Check is enabled by any ISA device to signal an error condition that can not be corrected. NMI signal becomes active upon seeing IOCHCK# active if the corresponding bit in Port B is enabled.

ISAOE# *Bidirectional OE Control*. This signal controls the OE signal of the external transceiver that connects the IDE DD bus and ISA SA bus.

GPIOCS# *I/O General Purpose Chip Select 1*. This output signal is used by the external latch on ISA bus to latch the data on the SD[7:0] bus. The latch can be used by PMU unit to control the external peripheral devices to power down or any other desired function.
This pin is also serves as a strap input during reset.

2.2.9 IDE CONTROL

PIRQ *Primary Interrupt Request*. Interrupt request from primary IDE channel.

SIRQ *Secondary Interrupt Request*. Interrupt request from secondary IDE channel.

PDRQ *Primary DMA Request*. DMA request from primary IDE channel.

SDRQ *Secondary DMA Request*. DMA request from secondary IDE channel.

PDACK# *Primary DMA Acknowledge*. DMA acknowledge to primary IDE channel.

SDACK# *Secondary DMA Acknowledge*. DMA acknowledge to secondary IDE channel.

PIOR# *Primary I/O Read*. Primary channel read. Active low output.

PIOW# *Primary I/O Write*. Primary channel write. Active low output.

SIOR# *Secondary I/O Read* Secondary channel read. Active low output.

SIOW# *Secondary I/O Write* Secondary channel write. Active low output.

2.2.10 IPC

IRQ_MUX[3:0] *Multiplexed Interrupt Request*. These are the ISA bus interrupt signals. They are to be encoded before connection to the STPC Consumer using ISACLK and ISACLKX2 as the input selection strobes.

Note that IRQ8B, which by convention is connected to the RTC, is inverted before being sent to the interrupt controller, so that it may be connected directly to the $\overline{\text{IRQ}}$ pin of the RTC.

PCI_INT[3:0] *PCI Interrupt Request*. These are the PCI bus interrupt signals. They are to be en-

coded before connection to the STPC Consumer using ISACLK and ISACLKX2 as the input selection strobes.

DREQ_MUX[1:0] *ISA Bus Multiplexed DMA Request*. These are the ISA bus DMA request signals. They are to be encoded before connection to the STPC Consumer using ISACLK and ISACLKX2 as the input selection strobes.

DACK_ENC[2:0] *DMA Acknowledge*. These are the ISA bus DMA acknowledge signals. They are encoded by the STPC Consumer before output and should be decoded externally using ISACLK and ISACLKX2 as the control strobes.

TC *ISA Terminal Count*. This is the terminal count output of the DMA controller and is connected to the TC line of the ISA bus. It is asserted during the last DMA transfer, when the byte count expires.

SPKRD *Speaker Drive*. This the output to the speaker and is AND of the counter 2 output with bit 1 of Port 61, and drives an external speaker driver. This output should be connected to 7407 type high voltage driver.

2.2.11 X-Bus Interface pins / IDE Data

RMRTCCS# / DD[15] *ROM/Real Time clock chip select*. This pin is a multi-function pin. When ISAOE# is active, this signal is used as RMRTCCS#. This signal is asserted if a ROM access is decoded during a memory cycle. It should be combined with MEMR# or MEMW# signals to properly access the ROM. During a IO cycle, this signal is asserted if access to the Real Time Clock (RTC) is decoded. It should be combined with IOR or IOW# signals to properly access the real time clock.

When ISAOE# is inactive, this signal is used as IDE DD[15] signal.

This signal must be ORed externally with ISAOE# and is then connected to ROM and RTC. An LS244 or equivalent function can be used if OE# is connected to ISAOE# and the output is provided with a weak pull-up resistor.

KBCS# / DD[14] *Keyboard Chip Select*. This pin is a multi-function pin. When ISAOE# is active, this signal is used as KBCS#. This signal is asserted if a keyboard access is decoded during a I/O cycle.

When ISAOE# is inactive, this signal is used as IDE DD[14] signal.

This signal must be ORed externally with ISAOE# and is then connected to keyboard. An LS244 or equivalent function can be used if OE# is connect-

PIN DESCRIPTION

ed to ISAOE# and the output is provided with a weak pull-up resistor.

RTCRW# / DD[13] *Real Time Clock \overline{RW}* . This pin is a multi-function pin. When ISAOE# is active, this signal is used as RTCRW#. This signal is asserted for any I/O write to port 71H. When ISAOE# is inactive, this signal is used as IDE DD[13] signal.

This signal must be ORed externally with ISAOE# and then connected to the RTC. An LS244 or equivalent function can be used if OE is connected to ISAOE# and the output is provided with a weak pull-up resistor.

RTCDS# / DD[12] *Real Time Clock \overline{DS}* . This pin is a multi-function pin. When ISAOE# is active, this signal is used as RTCDS. This signal is asserted for any I/O read to port 71H.

When ISAOE# is inactive, this signal is used as IDE DD[12] signal.

This signal must be ORed externally with ISAOE# and is then connected to RTC. An LS244 or equivalent function can be used if OE# is connected to ISAOE# and the output is provided with a weak pull-up resistor.

RTCAS# *Real time clock address strobe*. This signal is asserted for any I/O write to port 70H.

2.2.12 Monitor Interface

RED, GREEN, BLUE *RGB Video Outputs*. These are the 3 analog color outputs from the RAMDACs

VSNC *Vertical Synchronisation Pulse*. This is the vertical synchronization signal from the VGA controller.

HSYNC *Horizontal Synchronisation Pulse*. This is the horizontal synchronization signal from the VGA controller.

VREF_DAC *DAC Voltage reference*. An external voltage reference is connected to this pin to bias the DAC.

RSET *Resistor Current Set*. This is reference current input to the RAMDAC is used to set the full-scale output of the RAMDAC.

COMP *Compensation*. This is the RAMDAC compensation pin. Normally, an external capacitor (typically 10nF) is connected between this pin and V_{DD} to damp oscillations.

DDC[1:0] *Direct Data Channel Serial Link*. These bidirectional pins are connected to CRTC register 3Fh to implement DDC capabilities. They conform to I²C electrical specifications, they have open-collector output drivers which are internally connected to V_{DD} through pull-up resistors.

They can instead be used for accessing I²C devices on board. DDC1 and DDC0 correspond to SCL and SDA respectively.

COL_CMP *Color Compare Output*. Allows access to the video signal which flags when there is a color compare hit. This signal is multiplexed with SMEMEW# on the ISA Bus. The signal is selected by setting Strap Option MD[0] as described in Section 3.

2.2.13 MISCELLANEOUS

SCAN_ENABLE *Reserved*. The pins are reserved for Test and Miscellaneous functions)

Note;

1) This Strap Option selects between two different functional blocks, the first is the ISA (SMEMW#) and the other is the VGA block (Color_Key).

2) Setting of Strap Options MD [2:15] have no effect on the DRAM Controller but are purely meant for software issues. i.e. Readable in a register.

3.1 STRAP REGISTER DESCRIPTION

3.1.1 STRAP REGISTER 0 INDEX 4AH (STRAP0)

Bits 7-0 of this register reflect the status of pins MD[7:0] respectively. They are expected to be connected on the system board to the SIMM configuration pins as follows:

Bit Sampled	Description
Bit 7	SIMM 0 dram type
Bits 6-5	SIMM 0 speed
Bit 4	SIMM 1 dram type
Bits 3-2	SIMM 1 speed
Bits 1-0	Reserved

Note that the SIMM speed and type information read here is meant only for the software and is not used by the hardware. The software must program the Host and graphics dram controller configuration registers appropriately based on these bits.

This register defaults to the values sampled on MD[7:0] pins after reset.

3.1.2 STRAP REGISTER 1 INDEX 4BH (STRAP1)

Bits 7-0 of this register reflect the status of pins MD[15:8] respectively. They are expected to be connected on the system board to the SIMM configuration pins as follows:

Bit Sampled	Description
Bit 7	SIMM 2 dram type
Bits 6-5	SIMM 2 speed
Bit 4	SIMM 3 dram type
Bits 3-2	SIMM 3 speed

Note that the SIMM speed and type information read here is meant only for the software and is not used by the hardware. The software must program the Host and graphics dram controller configuration registers appropriately based on these bits.

This register defaults to the values sampled on MD[15:8] pins after reset.

3.1.3 STRAP REGISTER 2 INDEX 4CH (STRAP2)

Bits 4-0 of this register reflect the status of pins MD[20:16] respectively. Bit 5 of this register reflect the status of pin MD[23]. Bit 4 is writeable, writes to other bits in this register have no effect.

They are use by the chip as follows:

Bit 4-2; Reserved

Bit 1 This bit reflects the **value sampled on MD[17] pin** and controls the PCI clock output as follows:

0: PCI clock output = HCLK / 2

1: PCI clock output = HCLK / 3

Bit 0; Reserved

This register defaults to the values sampled on MD[23] & MD[20:16] pins after reset.

3.1.4 HCLK PLL STRAP REGISTER 0 INDEX 5FH (HCLK_STRAP0)

Bits 5-0 of this register reflect the status of pins MD[26:21] respectively. They are use by the chip as follows:

Bits 5-3; These pins reflect the **value sampled on MD[26:24] pins** respectively and control the Host clock frequency synthesizer.

Bit 2-0; Reserved

This register defaults to the values sampled on above pins after reset.

Strap Options [39:27] are reserved.

3.1.5 486 CLOCK PROGRAMMING (486_CLK)

The bit MD[40] is used to set the clock multiplication factor of the 486 core. With the MD[40] pin pulled low the 486 will run in DX (x1) mode, while with the MD[40] pin pulled high the 486 will run in DX2 (x2) mode. The default value of the resistor on this strap input should be a resistor to ground (DX mode).

Strap options MD[43:41] are reserved.

4. ELECTRICAL SPECIFICATIONS

4.1 Introduction

The electrical specifications in this chapter are valid for the STPC Consumer.

4.2 Electrical Connections

4.2.1 Power/Ground Connections/Decoupling

Due to the high frequency of operation of the STPC Consumer, it is necessary to install and test this device using standard high frequency techniques. The high clock frequencies used in the STPC Consumer and its output buffer circuits can cause transient power surges when several output buffers switch output levels simultaneously. These effects can be minimized by filtering the DC power leads with low-inductance decoupling capacitors, using low impedance wiring, and by utilizing all of the VSS and VDD pins.

4.2.2 Unused Input Pins

All inputs not used by the designer and not listed in the table of pin connections in Chapter 3 should be connected either to VDD or to VSS. Connect active-high inputs to VDD through a 20 k Ω ($\pm 10\%$) pull-down resistor and active-low inputs to VSS and connect active-low inputs to VCC through a

20 k Ω ($\pm 10\%$) pull-up resistor to prevent spurious operation.

4.2.3 Reserved Designated Pins

Pins designated reserved should be left disconnected. Connecting a reserved pin to a pull-up resistor, pull-down resistor, or an active signal could cause unexpected results and possible circuit malfunctions.

4.3 Absolute Maximum Ratings

The following table lists the absolute maximum ratings for the STPC Consumer device. Stresses beyond those listed under Table 4-1 limits may cause permanent damage to the device. These are stress ratings only and do not imply that operation under any conditions other than those specified in section "Operating Conditions".

Exposure to conditions beyond Table 4-1 may (1) reduce device reliability and (2) result in premature failure even when there is no immediately apparent sign of failure. Prolonged exposure to conditions at or near the absolute maximum ratings (Table 4-1) may also result in reduced useful life and reliability.

Table 4-1. Absolute Maximum Ratings

Symbol	Parameter	Value	Units
V _{DDx}	DC Supply Voltage	-0.3, 4.0	V
V _I , V _O	Digital Input and Output Voltage	-0.3, VDD + 0.3	V
T _{STG}	Storage Temperature	-40, +150	°C
T _{OPER}	Operating Temperature	0, +70	°C
P _{TOT}	Total Power Dissipation	4.8	W

4.4 DC Characteristics

Table 4-2. DC Characteristics

Recommended Operating conditions : $V_{DD} = 3.3V \pm 0.3V$, $T_{case} = 0$ to $100^{\circ}C$ unless otherwise specified

Symbol	Parameter	Test conditions	Min	Typ	Max	Unit
V_{DD}	Operating Voltage		3.0	3.3	3.6	V
P_{DD}	Supply Power	$V_{DD} = 3.3V$, $H_{CLK} = 66MHz$		3.2	3.9	W
H_{CLK}	Internal Clock	(Note 1)			75	Mhz
$V_{REF_D_AC}$	DAC Voltage Reference		1.215	1.235	1.255	V
V_{OL}	Output Low Voltage	$I_{Load} = 1.5$ to $8mA$ depending of the pin			0.5	V
V_{OH}	Output High Voltage	$I_{Load} = -0.5$ to $-8mA$ depending of the pin	2.4			V
V_{IL}	Input Low Voltage	Except XTALI	-0.3		0.8	V
		XTALI	-0.3		0.9	V
V_{IH}	Input High Voltage	Except XTALI	2.1		$V_{DD}+0.3$	V
		XTALI	2.35		$V_{DD}+0.3$	V
I_{LK}	Input Leakage Current	Input, I/O	-5		5	μA
C_{IN}	Input Capacitance	(Note 2)				pF
C_{OUT}	Output Capacitance	(Note 2)				pF
C_{CLK}	Clock Capacitance	(Note 2)				pF

Notes:

1. MHz ratings refer to CPU clock frequency.
2. Not 100% tested.

rising clock edge reference level V_{REF} , and other reference levels are shown in Table 4-3 below for the STPC Consumer. Input or output signals must cross these levels during testing.

4.5 AC Characteristics

Table 4-4 through Table 4-9 list the AC characteristics including output delays, input setup requirements, input hold requirements and output float delays. These measurements are based on the measurement points identified in Figure 4-1 . The

Figure 4-1 shows output delay (A and B) and input setup and hold times (C and D). Input setup and hold times (C and D) are specified minimums, defining the smallest acceptable sampling window a synchronous input signal must be stable for correct operation.

Table 4-3. Drive Level and Measurement Points for Switching Characteristics

Symbol	Value	Units
V_{REF}	1.5	V
V_{IHD}	3.0	V
V_{ILD}	0.0	V

Note: Refer to Figure 4-1.

MECHANICAL DATA

5.2 388-Pin Package thermal data

388-pin PBGA package has a Power Dissipation Capability of 4.5W which increases to 6W when used with a Heatsink.

Structure is shown in Figure 5-4.

Thermal dissipation options are illustrated in Figure 5-5 and Figure 5-6.

Figure 5-4. 388-Pin PBGA structure

Figure 5-5. Thermal dissipation without heatsink

Figure 5-6. Thermal dissipation with heatsink

6. BOARD LAYOUT

6.1 THERMAL DISSIPATION

Thermal dissipation of the STPC depends mainly on supply voltage. As a result, when the system does not need to work at 3.3V, it may be to reduce the voltage to 3.15V for example. This may save few 100's of mW.

The second area that can be considered is unused interfaces and functions. Depending on the application, some input signals can be grounded, and some blocks not powered or shutdown. Clock speed dynamic adjustment is also a solution that can be used along with the integrated power management unit.

The standard way to route thermal balls to internal ground layer implements only one via pad for each ball pad, connected using a 8-mil wire.

With such configuration the Plastic BGA 388 package dissipates 90% of the heat through the ground balls, and especially the central thermal balls which are directly connected to the die, the remaining 10% is dissipated through the case. Adding a heat sink reduces this value to 85%.

As a result, some basic rules have to be applied when routing the STPC in order to avoid thermal problems.

First of all, the whole ground layer acts as a heat sink and ground balls must be directly connected to it as illustrated in Figure 6-1.

If one ground layer is not enough, a second ground plane may be added on the solder side.

Figure 6-1. Ground routing

BOARD LAYOUT

When considering thermal dissipation, the most important - and not the more obvious - part of the layout is the connection between the ground balls and the ground layer.

A 1-wire connection is shown in Figure 6-2. The use of a 8-mil wire results in a thermal resistance of 105°C/W assuming copper is used ($418 \text{ W/m}\cdot^{\circ}\text{K}$). This high value is due to the thickness ($34 \mu\text{m}$) of the copper on the external side of the PCB.

Considering only the central matrix of 36 thermal balls and one via for each ball, the global thermal resistance is 2.9°C/W . This can be easily improved by using four 10 mil wires to connect to the four vias around the ground pad link as in Figure 6-3. This gives a total of 49 vias and a global resistance for the 36 thermal balls of 0.6°C/W .

The use of a ground plane like in Figure 6-4 is even better.

To avoid solder wicking over to the via pads during soldering, it is important to have a solder mask of 4 mil around the pad (NSMD pad), this gives a diameter of 33 mil for a 25 mil ground pad.

To obtain the optimum ground layout, place the vias directly under the ball pads. In this case no local board distortion is tolerated.

The thickness of the copper on PCB layers is typically $34 \mu\text{m}$ for external layers and $17 \mu\text{m}$ for internal layers. This means thermal dissipation is not good and temperature of the board is concentrated around the devices and falls quickly with increased distance.

When it is possible to place a metal layer inside the PCB, this improves dramatically the heat spreading and hence thermal dissipation of the board.

Figure 6-2. Recommended 1-wire ground pad layout

Figure 6-3. Recommended 4-wire ground pad layout

Figure 6-4. Optimum layout for central ground ball

The PBGA Package also dissipates heat through peripheral ground balls. When a heat sink is placed on the device, heat is more uniformly spread throughout the moulding increasing heat dissipation through the peripheral ground balls.

The more via pads are connected to each ground ball, the more heat is dissipated. The only limitation is the risk of losing routing channels.

Figure 6-5 shows a routing with a good trade off between thermal dissipation and number of routing channels.

Figure 6-5. Global ground layout for good thermal dissipation

Figure 6-6. Bottom side layout and decoupling

A local ground plane on opposite side of the board as shown in Figure 6-6 improves thermal dissipation. It is used to connect decoupling capacitances but can also be used for connection to a heat sink or to the system's metal box for better dissipation.

This possibility of using the whole system's box for thermal dissipation is very useful in case of high temperature inside the system and low temperature outside. In that case, both sides of the PBGA should be thermally connected to the metal chassis in order to propagate the heat through the metal. Figure 6-7 illustrates such an implementation.

Figure 6-7. Use of metal plate for thermal dissipation

6.2 HIGH SPEED SIGNALS

Some Interfaces of the STPC run at high speed and have to be carefully routed or even shielded.

Here is the list of these interfaces, in decreasing speed order:

- Memory Interface.
- Graphics and video interfaces
- PCI bus
- 14MHz oscillator stage

All the clocks have to be routed first and shielded for speeds of 27MHz or more. The high speed signals have the same constraints as some of the memory interface control signals.

The next interfaces to be routed are Memory, Video/graphics, and PCI.

All the analog noise sensitive signals have to be routed in a separate area and hence can be routed independently.

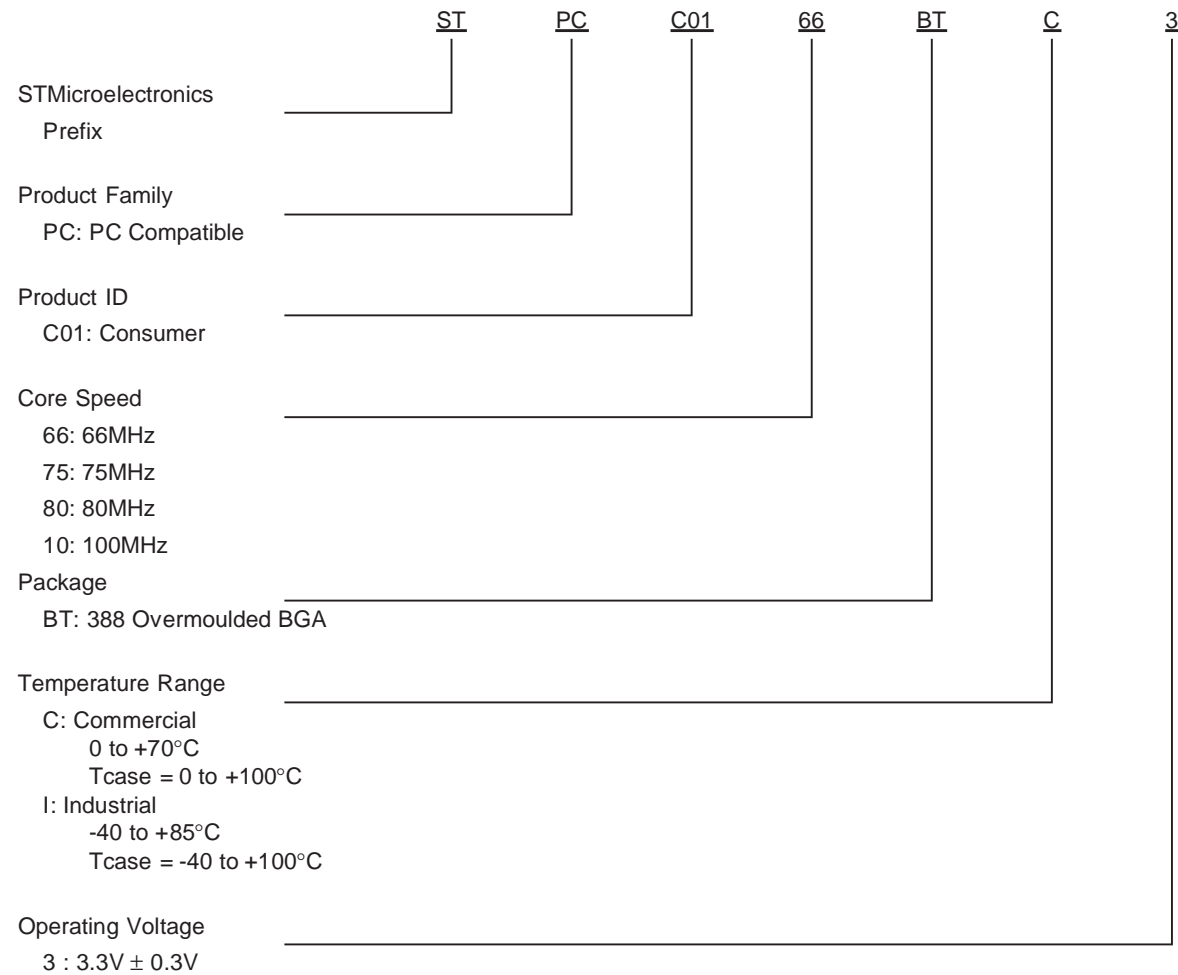

Figure 6-8. Shielding signals
