

STV9118

LOW-COST I²C CONTROLLED DEFLECTION PROCESSOR FOR MULTISYNC MONITOR

DATASHEET

FEATURES

General

- ADVANCED I²C BUS CONTROLLED DEFLECTION PROCESSOR DEDICATED FOR HIGH-END CRT MONITORS
- SINGLE SUPPLY VOLTAGE 12V
- VERY LOW JITTER
- DC/DC CONVERTER CONTROLLER
- ADVANCED EW DRIVE
- ADVANCED ASYMMETRY CORRECTIONS
- AUTOMATIC MULTISTANDARD SYNCHRONIZATION
- VERTICAL DYNAMIC CORRECTION WAVEFORM OUTPUT
- X-RAY PROTECTION AND SOFT-START & STOP ON HORIZONTAL AND DC/DC DRIVE OUTPUTS
- I²C BUS STATUS REGISTER

Horizontal section

- 100 kHz maximum frequency
- Corrections of geometric asymmetry: Pin cushion asymmetry, Parallelogram
- Tracking of asymmetry corrections with vertical size and position
- Fully integrated internal horizontal moiré cancellation and moiré cancellation output

Vertical section

- 200 Hz maximum frequency
- Vertical ramp for DC-coupled output stage with adjustments of: C-correction, S-correction for super-flat CRT, Vertical size, Vertical position
- Vertical moiré cancellation through vertical ramp waveform
- Compensation of vertical breathing with EHT variation

EW section

- Symmetrical geometry corrections: Pin cushion, Keystone, Top/Bottom corners separately
- Horizontal size adjustment
- Tracking of EW waveform with Vertical size and position and adaptation to frequency
- Compensation of horizontal breathing through EW waveform

Dynamic correction section

- Output with vertical dynamic correction waveform for dynamic corrections like focus, brightness uniformity, ...
- Fixed on screen by means of tracking system

DC/DC controller section

- N-MOS transistor drive
- External sawtooth configuration
- Bus-controlled output voltage
- Synchronization on hor. frequency with phase selection

DESCRIPTION

The STV9118 is a monolithic integrated circuit assembled in a 32-pin shrink dual-in-line plastic package. This IC controls all the functions related to horizontal and vertical deflection in multimode or multi-frequency computer display monitors.

The internal sync processor, combined with the powerful geometry correction block, makes the STV9118 suitable for very high performance monitors, using few external components.

Combined with other ST components dedicated for CRT monitors (microcontroller, video preamplifier, video amplifier, OSD controller) the STV9118 allows fully I²C bus-controlled computer display monitors to be built with a reduced number of external components.

SHRINK 32 (Plastic Package)
ORDER CODE: STV9118

5 - QUICK REFERENCE DATA

Characteristic	Value	Unit
General		
Package	SDIP 32	
Supply voltage	12	V
Supply current	65	mA
Application category	Mid-range	
Means of control/Maximum clock frequency	I ² C bus/400	kHz
EW drive	Yes	
DC/DC converter controller	Yes	
Adjustable DC level output	No	
Horizontal section		
Frequency range	15 to 100	kHz
Autosync frequency ratio (can be enlarged in application)	4.28	
Positive/Negative polarity of horizontal sync signal/Automatic adaptation	Yes/Yes/Yes	
Duty cycle range of the drive signal	30 to 65	%
Position adjustment range with respect to H period	±10	%
Soft start/Soft stop feature	Yes/Yes	
Hardware/Software PLL lock indication	Yes/Yes	
Parallelogram	Yes	
Pin cushion asymmetry correction (also called Side pin balance)	Yes	
Top/Bottom/Common corner asymmetry correction	No/No/No	
Tracking of asymmetry corrections with vertical size & position	Yes	
Horizontal moiré cancellation (int./ext.) for Combined/Separated architecture	Yes/Yes	
Vertical section		
Frequency range	35 to 200	Hz
Autosync frequency range (150nF at VCap and 470nF at VAGCCap)	50 to 180	Hz
Positive/Negative polarity of vertical sync signal/Automatic adaptation	Yes/Yes/Yes	
S-correction/C-correction/Super-flat tube characteristic	Yes/Yes/Yes	
Vertical size/Vertical position adjustment	Yes/Yes	
Vertical moiré cancellation (internal)	Yes	
Vertical breathing compensation	Yes	
EW section		
Pin cushion correction	Yes	
Keystone correction	Yes	
Top/Bottom/Common corner correction	Yes/Yes/No	
Horizontal size adjustment	Yes	
Tracking of EW waveform with Frequency/Vertical size & position	Yes/Yes	
Breathing compensation on EW waveform	Yes	
Dynamic correction section (dyn. focus, dyn. brightness,...)		
Vertical dynamic correction output	Yes	
Horizontal dynamic correction output	No	
Composite HV dynamic correction output	No	
Tracking of vertical waveform with V. size & position	Yes	
DC/DC controller section		
Step-up/Step-down conversion mode	Yes/Yes(ext)	
Internal/External sawtooth configuration	No/Yes	
Bus-controlled output voltage	Yes	
Soft start/Soft stop feature	Yes/Yes	
Positive(N-MOS)/Negative(P-MOS) polarity of BOut signal	Yes/No	

6 - ABSOLUTE MAXIMUM RATINGS

All voltages are given with respect to ground.

Currents flowing from the device (sourced) are signed negative. Currents flowing to the device are signed positive.

The value ranges must be absolutely respected, any excess thereof may cause permanent damage to the device.

Symbol	Parameter	Value		Unit
		Min	Max	
V_{CC}	Supply voltage (pin V_{CC})	-0.4	13.5	V
$V_{(pin)}$	Pins $HEHTIn$, $VEHTIn$, $XRay$, $HOut$, $BOut$	-0.4	V_{CC}	V
	Pins $H/HVSyn$, $VSyn$, SCL , SDA	-0.4	5.5	V
	Pins $HLckVBk$, CO , RO , $HPLL1F$, $HPosF$, $HMoiré$, $BRegIn$, $BI-Sense$, $VAGCCap$, $VCap$, $VDyCor$, $HOscF$, $VOscF$	-0.4	V_{RefO}	V
	Pin $HPLL2C$	-0.4	$V_{RefO}/2$	V
	Pin $HFly$	-0.4	V_{RefO}	V
$I_{(pin)}$	Pin $HMoiré$	-200	100	mA
	Pins other than $HMoiré$	-200	200	mA
V_{ESD}	ESD susceptibility (human body model: discharge of 100pF through 1.5k Ω)	-2000	2000	V
T_{stg}	Storage temperature	-40	150	°C
T_j	Junction temperature		150	°C

7 - ELECTRICAL PARAMETERS AND OPERATING CONDITIONS

The medium (middle) value of an I²C Bus control or adjustment register composed of bits D0, D1,...,Dn is the one having Dn at "1" and all other bits at "0". The minimum value is the one with all bits at 0, maximum value is the one with all at "1".

Currents flowing from the device (sourced) are signed negative. Currents flowing to the device are signed positive.

T_H is the period of horizontal deflection.

7.1 - THERMAL DATA

Symbol	Parameter	Value			Unit
		Min.	Typ.	Max.	
T _{amb}	Operating ambient temperature	0		70	°C
R _{th(j-a)}	Junction-ambience thermal resistance		65		°C/W

7.2 - SUPPLY AND REFERENCE VOLTAGES

T_{amb} = 25°C

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
V _{CC}	Supply voltage at V _{CC} pin		10.8	12	13.2	V
I _{CC}	Supply current to V _{CC} pin	V _{CC} = 12V		65		mA
V _{RefO}	Reference output voltage at RefOut pin	V _{CC} = 12V, I _{RefO} = -2mA	7.65	7.9	8.2	V
I _{RefO}	Current sourced by RefOut output		-5		0	mA

7.3 - SYNCHRONIZATION INPUTS

V_{CC} = 12V, T_{amb} = 25°C

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
V _{LoH/HVSyn}	LOW level voltage on H/HVSyn		0		0.8	V
V _{HiH/HVSyn}	HIGH level voltage on H/HVSyn		2.2		5	V
V _{LoV/Syn}	LOW level voltage on V/Syn		0		0.8	V
V _{HiV/Syn}	HIGH level voltage on V/Syn		2.2		5	V
R _{PdSyn}	Internal pull-down on H/HVSyn, V/Syn		100	175	250	kΩ
t _{PulseHSyn}	H sync. pulse duration on H/HVSyn pin		0.5			μs
t _{PulseHSyn/T_H}	Proportion of H sync pulse to H period	Pin H/HVSyn			0.2	
t _{PulseV/Syn}	V sync. pulse duration	Pins H/HVSyn, V/Syn	0.5		750	μs
t _{PulseV/Syn/T_V}	Proportion of V sync pulse to V period	Pins H/HVSyn, V/Syn			0.15	
t _{extrV/T_H}	Proportion of sync pulse length to H period for extraction as V sync pulse	Pin H/HVSyn, cap. on pin CO = 820pF	0.21	0.3		
t _{HPolDet}	Polarity detection time (after change)	Pin H/HVSyn	0.75			ms

7.4 - HORIZONTAL SECTION

V_{CC} = 12V, T_{amb} = 25°C

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
PLL1						
I _{RO}	Current load on RO pin				1.5	mA
C _{CO}	Capacitance on CO pin		390			pF
f _{HO}	Frequency of hor. oscillator				100	kHz
f _{HO(0)}	Free-running frequency of hor. oscill. ⁽¹⁾	R _{RO} =5.23kΩ, C _{CO} =820pF	27	28.5	29.9	kHz
f _{HOCapt}	Hor. PLL1 capture frequency ⁽⁴⁾	f _{HO(0)} = 28.5kHz	29		122	kHz
$\frac{\Delta f_{HO(0)}}{f_{HO(0)} \cdot \Delta T}$	Temperature drift of free-running freq. ⁽³⁾			-150		ppm/°C
Δf _{HO} /ΔV _{HO}	Average horizontal oscillator sensitivity	f _{HO(0)} = 28.5kHz		19.6		kHz/V
V _{HO}	H. oscill. control voltage on pin HPLL1F	V _{RefO} =8V	1.4		6.0	V
V _{HOThrfr}	Threshold on H. oscill. control voltage on HPLL1F pin for tracking of EW with freq.	V _{RefO} =8V		5.0		V
V _{HPosF}	Control voltage on HPosF pin	HPOS (Sad01): 1111111xb 1000000xb 0000000xb		2.8 3.4 4.0		V V V
V _{HOThrLo}	Bottom of hor. oscillator sawtooth ⁽⁶⁾			1.6		V
V _{HOThrHi}	Top of hor. oscillator sawtooth ⁽⁶⁾			6.4		V
PLL2						
R _{In(HFly)}	Input impedance on HFly input	V _(HFly) > V _{ThrHFly} ⁽²⁾	300	500	700	Ω
I _{InHFly}	Current into HFly input	At top of H flyback pulse			5	mA
V _{ThrHFly}	Voltage threshold on HFly input		0.6	0.7		V
V _{S(0)}	H flyback lock middle point ⁽⁶⁾	No PLL2 phase modulation		4.0		V
V _{BotHPLL2C}	Low clamping voltage on HPLL2C pin ⁽⁵⁾			1.6		V
V _{TopHPLL2C}	High clamping voltage on HPLL2C pin ⁽⁵⁾			4.0		V
t _{ph(min)} /T _H	Min. advance of H-drive OFF before middle of H flyback ⁽⁷⁾	Null asym. correction		0		%
t _{ph(max)} /T _H	Max. advance of H-drive OFF before middle of H flyback ⁽⁸⁾	Null asym. correction		44		%
H-drive output on pin HOut						
I _{HOut}	Current into HOut output	Output driven LOW			30	mA
t _{Hoff} /T _H	Duty cycle of H-drive signal	HDUTY (Sad00): x1111111b x0000000b Soft-start/Soft-stop value		27 65 85		% % %
Picture geometry corrections through PLL1 & PLL2						
t _{Hph} /T _H	H-flyback (center) static phase vs. sync signal (via PLL1), see Figure 7	HPOS (Sad01): 1111111xb 0000000xb		+11 -11		% %

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
t_{PCAC}/T_H	Contribution of pin cushion asymmetry correction to phase of H-drive vs. static phase (via PLL2), measured in corners	$PCAC$ (Sad11h) full span ⁽⁹⁾ $VPOS$ at medium $VSIZE$ at minimum $VSIZE$ at medium $VSIZE$ at maximum		± 1.0 ± 1.8 ± 2.8		% % %
t_{ParalC}/T_H	Contribution of parallelogram correction to phase of H-drive vs. static phase (via PLL2), measured in corners	$PARAL$ (Sad12h) full span ⁽⁹⁾ $VPOS$ at medium $VSIZE$ at minimum $VSIZE$ at medium $VSIZE$ at maximum $VPOS$ at max. or min. $VSIZE$ at minimum		± 1.75 ± 2.2 ± 2.8 ± 1.75		% % % %

Note 1: Frequency at no sync signal condition. For correct operation, the frequency of the sync signal applied must always be higher than the free-running frequency. The application must consider the spread of values of real electrical components in R_{RO} and C_{CO} positions so as to always meet this condition. The formula to calculate the free-running frequency is $f_{HO(0)} = 0.12125 / (R_{RO} C_{CO})$

Note 2: Base of NPN transistor with emitter to ground is internally connected on pin HFLY through a series resistance of about 500Ω and a resistance to ground of about 20kΩ.

Note 3: Evaluated and figured out during the device qualification phase. Informative. Not tested on every single unit.

Note 4: This capture range can be enlarged by external circuitry.

Note 5: The voltage on $HPLL2C$ pin corresponds to immediate phase of leading edge of H-drive signal on $HOut$ pin with respect to internal horizontal oscillator sawtooth. It must be between the two clamping levels given. Voltage equal to one of the clamping values indicates a marginal operation of PLL2 or non-locked state.

Note 6: Internal threshold. See Figure 10.

Note 7: The $t_{ph(min)}/T_H$ parameter is fixed by the application. For correct operation of asymmetry corrections through dynamic phase modulation, this minimum must be increased by maximum of the total dynamic phase required in the direction leading to bending of corners to the left. Marginal situation is indicated by reach of $V_{TopHPLL2C}$ high clamping level by waveform on pin $HPLL2C$. Also refer to Note 5 and Figure 10.

Note 8: The $t_{ph(max)}/T_H$ parameter is fixed by the application. For correct operation of asymmetry corrections through dynamic phase modulation, this maximum must be reduced by maximum of the total dynamic phase required in the direction leading to bending of corners to the right. Marginal situation is indicated by reach of $V_{BotHPLL2C}$ low clamping level by waveform on pin $HPLL2C$. Also refer to Note 5 and Figure 10.

Note 9: All other dynamic phase corrections of picture asymmetry set to their neutral (medium) positions.

7.5 - VERTICAL SECTION

$V_{CC} = 12V$, $T_{amb} = 25^\circ C$

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
AGC-controlled vertical oscillator sawtooth; $V_{RefO} = 8V$						
$R_{L(VAGCCap)}$	Ext. load resistance on $VAGCCap$ pin ⁽¹⁰⁾	$\Delta V_{amp}/V_{amp}(R=\infty) \leq 1\%$	65			MΩ
V_{VOB}	Sawtooth bottom voltage on $VCap$ pin ⁽¹¹⁾	No load on $VOscF$ pin ⁽¹¹⁾		2		V
V_{VOT}	Sawtooth top voltage on $VCap$ pin	AGC loop stabilized V sync present No V sync		5 4.9		V V

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
t_{VODis}	Sawtooth Discharge time	$C_{VCap}=150nF$		80		μs
$f_{VO(0)}$	Free-running frequency	$C_{VCap}=150nF$		100		Hz
f_{VOCapt}	AGC loop capture frequency	$C_{VCap}=150nF$	50		185	Hz
$\frac{\Delta V_{VOdev}}{V_{VOamp(16)}}$	Sawtooth non-linearity ⁽¹²⁾	AGC loop stabilized, ⁽¹²⁾		0.5		%
$\frac{\Delta V_{VOS-cor}}{V_{VOamp}}$	S-correction range	AGC loop stabilized, ⁽¹³⁾ $t_{VR}=1/4 T_{VR}$ ⁽¹⁵⁾ $t_{VR}=3/4 T_{VR}$		-5 +5		% %
$\frac{\Delta V_{VOC-cor}}{V_{VOamp}}$	C-correction range	AGC loop stabilized, ⁽¹⁴⁾ $t_{VR}=1/2 T_{VR}$ ⁽¹⁵⁾ $CCOR$ (Sad0A): x0000000b x1000000b x1111111b		-3 0 +3		% % %
$\frac{\Delta V_{VOamp}}{V_{VOamp} \cdot \Delta f_{VO}}$	Frequency drift of sawtooth amplitude ⁽¹⁷⁾⁽¹⁸⁾	AGC loop stabilized $f_{VOCapt(min)} \leq f_{VO} \leq f_{VOCapt(max)}$		200		ppm/ Hz
Vertical output drive signal (on pin V_{Out}); $V_{RefO} = 8V$						
$V_{mid(VOut)}$	Middle point on V_{Out} sawtooth	V_{POS} (Sad08): x0000000b x1000000b x1111111b	3.65	3.2 3.5 3.8	3.3	V V V
V_{amp}	Amplitude of V_{Out} sawtooth (peak-to-peak voltage)	V_{SIZE} (Sad07): x0000000b x1000000b x1111111b	3.5	2.25 3.0 3.75	2.5	V V V
$V_{offVOut}$	Level on V_{Out} pin at V-drive "off"	$I^2Cbit V_{OutEn}$ at 0		3.8		V
I_{VOut}	Current delivered by V_{Out} output		-5		5	mA
V_{VEHT}	Control input voltage range on $VEHTIn$ pin		1		V_{RefO}	V
$\frac{\Delta V_{amp}}{V_{amp} \cdot \Delta V_{VEHT}}$	Breathing compensation	$V_{VEHT} > V_{RefO}$ $V_{VEHT(min)} \leq V_{VEHT} \leq V_{RefO}$		0 2.5		%/V %/V

Note 10: Value of acceptable cumulated parasitic load resistance due to humidity, AGC storage capacitor leakage, etc., for less than 1% of V_{amp} change.

Note 11: The threshold for V_{VOB} is generated internally and routed to $VOscF$ pin. Any DC current on this pin will influence the value of V_{VOB} .

Note 12: Maximum of deviation from an ideally linear sawtooth ramp at null $SCOR$ (Sad09 at x0000000b) and null $CCOR$ (Sad0A at x1000000b). The same rate applies to V-drive signal on V_{Out} pin.

Note 13: Maximum $SCOR$ (Sad09 at x1111111b), null $CCOR$ (Sad0A at x1000000b).

Note 14: Null $SCOR$ (Sad09 at x0000000b).

Note 15: " t_{VR} " is time from the beginning of vertical ramp of V-drive signal on V_{Out} pin. " T_{VR} " is duration of this ramp, see chapter [TYPICAL OUTPUT WAVEFORMS](#) and [Figure 13](#).

Note 16: $V_{VOamp} = V_{VOT} - V_{VOB}$

Note 17: The same rate applies to V-drive signal on V_{Out} pin.

Note 18: Informative, not tested on each unit.

7.6 - EW DRIVE SECTION

 $V_{CC} = 12V$, $T_{amb} = 25^{\circ}C$

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
V_{EW}	Output voltage on EWOut pin		1.8		6.5	V
I_{EWOut}	Current sourced by EWOut output		-1.5		TBD	mA
V_{HEHT}	Control voltage range on HEHTIn pin		1		V_{RefO}	V
V_{EW-DC}	DC component of the EW-drive signal on EWOut pin	(19)(22)(23)(30) $t_{VR}=1/2 T_{VR}$ (15) <i>HSIZE</i> (Sad10h): 0000000xb 1000000xb 1111111xb		2 3.25 4.5		V V V
$\frac{\Delta V_{EW-DC}}{\Delta V_{HEHT}}$	Breathing compensation on V_{EW-DC}	(19)(20)(21)(22) $t_{VR}=1/2 T_{VR}$ (15) $V_{HEHT} > V_{RefO}$ $V_{HEHT(min)} \leq V_{HEHT} \leq V_{RefO}$		0 -0.125		V/V V/V
$\frac{\Delta V_{EW-DC}}{V_{EW-DC} \cdot \Delta T}$	Temperature drift of DC component of the EW-drive signal on EWOut pin	$t_{VR}=1/2 T_{VR}$ (15) Notes (18)(19)(21)(23)(30)		100		ppm/°C
V_{EW-PCC}	Pin cushion correction component of the EW-drive signal on EWOut pin	(19)(20)(21)(23)(24)(25)(26)(30) <i>VSIZE</i> at maximum <i>PCC</i> (Sad0C): x0000000b x1000000b x1111111b Tracking with <i>VSIZE</i> : <i>PCC</i> at x1000000b <i>VSIZE</i> (Sad07): x0000000b x1000000b		0 0.7 1.5 0.25 0.5		V V V V V
$\frac{V_{EW-PCC}[t_{vr}=0]}{EW-PCC[t_{vr}=T_{VR}]}$	Tracking of PCC component of the EW-drive signal with vertical position adjustment	(19)(20)(21)(24)(27)(29)(30) <i>PCC</i> at x1111111b <i>VPOS</i> (Sad08): x0000000b x1111111b		0.52 1.92

Note 33: Ratio "A/B" of vertical parabola component voltage at $t_{VR}=0$ versus vertical parabola component voltage at $t_{VR}=T_{VR}$.

Note 34: Unsigned value. Polarity selection by VDyCorPol I²C Bus bit. Refer to section I²C Bus control register map.

7.8 - DC/DC CONTROLLER SECTION

$V_{CC} = 12V$, $T_{amb} = 25^{\circ}C$

Symbol	Parameter	Test Conditions	Value			Units
			Min.	Typ.	Max.	
R_{B+FB}	Ext. resistance applied between BComp output and BRegIn input		5			k Ω
A_{OLG}	Open loop gain of error amplifier on BRegIn input	Low frequency ⁽¹⁸⁾		100		dB
f_{UGBW}	Unity gain bandwidth of error amplifier on BRegIn input	(18)		6		MHz
I_{RI}	Bias current delivered by regulation input BRegIn			-0.2		μA
I_{BComp}	Output current capability of BComp output.	HBOutEn = "Enable" HBOutEn = "Disable" ⁽³⁵⁾	-0.5	0.5	2.0	mA mA
$A_{BISense}$	Voltage gain on BISense input			3		
$V_{ThrBIsCurr}$	Threshold voltage on BISense input corresponding to current limitation		TBD	2.1		V
$I_{BISense}$	Input current sourced by BISense input			-1		μA
t_{BOn}	Conduction time of the power transistor	⁽³⁸⁾			$T_H - t_{inh}$	
I_{BOut}	Output current capability of BOut output		0		10	mA
V_{BOSat}	Saturation voltage of the internal output transistor on BOut	$I_{BOut}=10mA$		0.25		V
V_{BReg}	Regulation reference for BRegIn voltage ⁽³⁶⁾	$V_{RefO}=8V$ BREF (Sad03): x0000000b x1000000b x1111111b		3.8 4.9 6.0		V V V
$t_{BTrigDel} / T_H$	Delay of BOut "Off-to-On" edge after middle of flyback pulse, as part of T_H ⁽³⁷⁾	BOutPh = "0"		16		%

Note 35: A current sink is provided by the BComp output while BOut is disabled:

Note 36: Internal reference related to V_{RefO} . The same values to be found on pin BRegIn, while regulation loop is stabilized.

Note 37: Only applies to configuration specified in "Test conditions" column, i.e. synchronization of BOut "Off-to-On" edge with horizontal flyback signal. Refer to chapter "DC/DC controller" for more details.

Note 38: t_{inh} is about 300ns regardless of the H frequency

7.9 - MISCELLANEOUS

$V_{CC} = 12V$, $T_{amb} = 25^{\circ}C$

Note 43: For any H and V correction component of the waveforms on **EWOut** and **VOOut** pins and for internal waveform for corrections of H asymmetry, displayed in the table, weight of the other relevant components is nullified (minimum for parabola, S-correction, medium for keystone, all corner corrections, C-correction, parallelogram, parabola asymmetry correction, written in corresponding registers).

9 - I²C BUS CONTROL REGISTER MAP

The device slave address is 8C in write mode and 8D in read mode.

Bold weight denotes default value at Power-On-Reset.

I²C Bus data in the adjustment register is buffered and internally applied with discharge of the vertical oscillator ⁽⁴⁴⁾.

In order to ensure compatibility with future devices, all "Reserved" bits should be set to 0.

Sad	D7	D6	D5	D4	D3	D2	D1	D0

Note 44: With exception of *HDUTY* and *BREF* adjustments data that can take effect instantaneously if switches *HDutySyncV* and *B+SyncV* are at 0 respectively.

Note 45: In Read Mode, the device always outputs data of the status register, regardless of sub address previously selected.

Note 46: The TV, TH, TVM and THM bits are for testing purposes and must be kept at 0 by application.

Description of I²C Bus switches and flags

Write-to bits

Sad00/D7 - HDutySyncV

Synchronization of internal application of **H**orizontal **D**uty cycle data, buffered in I²C Bus latch, with internal discharge of **V**ertical oscillator

- 0: Asynchronous mode, new data applied with ACK bit of I²C Bus transfer on this sub address
- 1: Synchronous mode

Sad02/D7 - HMoiré

Horizontal **M**oiré characteristics

- 0: Adapted to an architecture with EHT generated in deflection section
- 1: Adapted to an architecture with separated deflection and EHT sections

Sad03/D7 - B+SyncV

Same as *HDutySyncV*, applicable for **B+** reference data

Sad07/D7 - BOutPh

Phase of start of **B+** drive signal on **B**Out pin

- 0: Just after horizontal flyback pulse
- 1: With one of edges of line drive signal on **H**Out pin, selected by **BOHEdge** bit

Sad08/D7 - EWTrHFr

Tracking of all corrections contained in waveform on pin **EW**Out with **H**orizontal **F**requency

- 0: Not active
- 1: Active

Sad15/D7 - VDyCorPol

Polarity of **V**ertical **D**ynamic **C**orrection waveform (parabola)

- 0: Concave (minimum in the middle of the parabola)
- 1: Convex (maximum in the middle of the parabola)

Sad16/D0 - HLockEn

Enable of output of **H**orizontal **P**LL1 **L**ock/unlock status signal on pin **HL**ckVBk

- 0: Disabled, vertical blanking only on the pin **HL**ckVBk
- 1: Enabled

Sad16/D1 - PLL1InhEn

Enable of **Inhibition** of horizontal **PLL1** during extracted vertical synchronization pulse

- 0: Disabled, PLL1 is never inhibited
- 1: Enabled

Sad16/D2 - PLL1Pump

Horizontal **PLL1** charge **Pump** current

- 0: Slow PLL1, low current
- 1: Fast PLL1, high current

Sad16/D3 - HMoiMode

Horizontal Moiré Mode. In position "Internal", the H-moiré signal affects timing of H-drive signal on **HOut** pin. In position "External", the H-moiré signal is output on **HMoiré** pin and has no effect on H-drive. In both cases, the amplitude of H-moiré signal is adjusted through I²C Bus register *HMOIRE*.

- 0: Internal
- 1: External

Sad16/D4 - SDetReset

Reset to 0 of **Synchronization Detection** flags **VDet**, **HVDet** and **VExtrDet** of status register effected with ACK bit of I²C Bus data transfer into register containing the **SDetReset** bit. Also see description of the flags.

- 0: No effect
- 1: Reset with automatic return of the bit to 0

Sad16/D5 - VSyncSel

Vertical **Synchronization** input **Selection** between the one extracted from composite HV signal on pin **H/HVSyn** and the one on pin **VSyn**. No effect if **VSynAuto** bit is at 1.

- 0: V. sync extracted from composite signal on **H/HVSyn** pin selected
- 1: V. sync applied on **VSyn** pin selected

Sad16/D6 - VSyncAuto

Vertical **Synchronization** input selection **Automatic** mode. If enabled, the device automatically selects between the vertical sync extracted from composite HV signal on pin **H/HVSyn** and the one on pin **VSyn**, based on detection mechanism. If both are present, the one coming first is kept.

- 0: Disabled, selection done according to bit **VSynSel**
- 1: Enabled, the bit **VSynSel** has no effect

Sad16/D7 - XRayReset

Reset to 0 of **XRay** flag of status register effected with ACK bit of I²C Bus data transfer into register containing the **XRayReset** bit. Also see description of the flag.

- 0: No effect
- 1: Reset with automatic return of the bit to 0

Sad17/D0 - BlankMode**Blanking operation Mode**

- 0: Blanking pulse starting with detection of vertical synchronization pulse and ending with end of vertical oscillator discharge (start of vertical sawtooth ramp on the **VOut** pin)
- 1: Permanent blanking - high blanking level in composite signal on pin **HLckVBk** is permanent

Sad17/D1 - VOutEn**Vertical Output Enable**

- 0: Disabled, **V_{off}VOut** on **VOut** pin (see 7.5 - Vertical section)
- 1: Enabled, vertical ramp with vertical position offset on **VOut** pin

Sad17/D2 - HBOutEn**Horizontal and B+ Output Enable**

- 0: Disabled, levels corresponding to "power transistor off" on **HOut** and **BOut** pins (high for **HOut**, low for **BOut**).
- 1: Enabled, horizontal deflection drive signal on **HOut** pin providing that it is not inhibited by another internal event (activated **XRay** protection). B+ drive signal on **BOut** pin.

Programming the bit to 1 after prior value of 0, will initiate soft start mechanism of horizontal drive and of B+ DC/DC convertor if this is in external sawtooth configuration.

Sad17/D3 - BOHEdge

Selection of **Edge** of Horizontal drive signal to phase **B+** drive Output signal on **BOut** pin. Only applies if the bit **BOutPh** is set to 1, otherwise **BOHEdge** has no effect.

- 0: Falling edge
- 1: Rising edge

Sad17/D4,D5,D6,D7 - THM, TVM, TH, TV

Test bits. They must be kept at 0 level by application S/W.

Read-out flags

SadXX/D0 - VDet ⁽⁴⁷⁾

Flag indicating **Detection** of **V** synchronization pulses on **VSyn** pin.

- 0: Not detected
- 1: Detected

SadXX/D1 - HVDet ⁽⁴⁷⁾

Flag indicating **Detection** of **H** or **HV** synchronization pulses applied on H/HV**Syn** pin. Once the sync pulses are detected, the flag is set and latched. Disappearance of the sync signal will not lead to reset of the flag.

- 0: Not detected
- 1: Detected.

SadXX/D2 - VExtrDet ⁽⁴⁷⁾

Flag indicating **Detection** of **Extracted Vertical** synchronization signal from composite H+V signal applied on H/HV**Syn** pin

- 0: Not detected
- 1: Detected

SadXX/D3 - VPol

Flag indicating **Polarity** of **V** synchronization pulses applied on **VSyn** pin with respect to mean level of the sync signal

- 0: Positive
- 1: Negative

SadXX/D4 - HVPol

Flag indicating **Polarity** of **H** or **HV** synchronization pulses applied on H/HV**Syn** pin with respect to mean level of the sync signal

- 0: Positive
- 1: Negative

SadXX/D5 - XRayAlarm

Alarm indicating that an event of excessive voltage has passed on **XRay** pin. Can only be reset to 0 through I²C Bus bit XRayReset or by power-on reset.

- 0: No excess since last reset of the bit
- 1: At least one event of excess appeared since the last reset of the bit, **HOut** inhibited

SadXX/D6 - VLock

Status of "**Locking**" or stabilization of **Vertical** oscillator amplitude to an internal reference by AGC regulation loop.

- 0: Locked (amplitude stabilized)
- 1: Not locked (amplitude non-stabilized)

SadXX/D7 - HLock

Status of **Locking** of **Horizontal** PLL1

- 0: Locked
- 1: Not locked

Note 47: This flag, by its value of 1, indicates an event of detection of at least one synchronization pulse since its last reset (by means of the **SDetReset** I²C Bus bit). This is to be taken into account by application S/W in a way that enough time (at least the period between 2 synchronization pulses of analyzed signal) must be provided between reset of the flag through **SDetReset** bit and validation of information provided in the flag after read-out of status register.

10 - OPERATING DESCRIPTION

10.1 - SUPPLY AND CONTROL

10.1.1 - Power supply and voltage references
The device is designed for a typical value of power supply voltage of 12 V.

In order to avoid erratic operation of the circuit at power supply ramp-up or ramp-down, the value of V_{CC} is monitored. See Figure 1 and electrical specifications. At switch-on, the device enters a "normal operation" as the supply voltage exceeds V_{CCEn} and stays there until it decreases below V_{CCDis} . The two thresholds provide, by their difference, a hysteresis to bridge potential noise. Outside the "normal operation", the signals on $HOut$, $BOut$ and $VOut$ outputs are inhibited and the I²C bus interface is inactive (high impedance on SDA , SCL pins, no ACK), all I²C bus control registers being reset to their default values (see chapter I²C BUS CONTROL REGISTER MAP on page 21).

Figure 1. Supply voltage monitoring

Internal thresholds in all parts of the circuit are derived from a common internal reference supply V_{RefO} that is lead out to $RefOut$ pin for external fil-

10.2 - SYNC. PROCESSOR

10.2.1 - Synchronization signals

The device has two inputs for TTL-level synchronization signals, both with hysteresis to avoid erratic detection and with a pull-down resistor. On $H/HVSyn$ input, pure horizontal or composite horizontal/vertical signal is accepted. On $VSyn$ input, only pure vertical sync. signal is accepted. Both positive and negative polarities may be applied on either input, see Figure 2. Polarity detector and programmable inverter are provided on each of the two inputs. The signal applied on $H/HVSyn$ pin, after polarity treatment, is directly lead to horizontal part and to an extractor of vertical sync. pulses, working on principle of integration, see Figure 3.

tering against ground as well as for external use with load currents limited to I_{RefO} . The filtering is necessary to minimize interference in output signals, causing adverse effects like e.g. jitter.

10.1.2 - I²C Bus Control

The I²C bus is a 2 line bi-directional serial communication bus introduced by Philips. For its general description, refer to corresponding Philips I²C bus specification.

This device is an I²C bus slave, compatible with fast (400kHz) I²C bus protocol, with write mode slave address of 8C (read mode slave address 8D). Integrators are employed at the SCL (Serial Clock) input and at the input buffer of the SDA (Serial Data) input/output to filter off the spikes of up to 50ns.

The device supports multiple data byte messages (with automatic incrementation of the I²C bus subaddress) as well as repeated Start Condition for I²C bus subaddress change inside the I²C bus messages. All I²C bus registers with specified I²C bus subaddress are of WRITE ONLY type, whereas the status register providing a feedback information to the master I²C bus device has no attributed I²C bus subaddress and is of READ ONLY type. The master I²C bus device reads this register sending directly, after the Start Condition, the READ device I²C bus slave address (8D) followed by the register read-out, NAK (No Acknowledge) signal and the Stop Condition.

For the I²C bus control register map, refer to chapter I²C BUS CONTROL REGISTER MAP on page 21.

The vertical sync. signal applied to the vertical deflection processor is selected between the signal extracted from the composite signal on $H/HVSyn$ input and the one applied on $VSyn$ input. The selector is controlled by $VSynSel$ I²C bus bit.

Besides the polarity detection, the device is capable of detecting the presence of sync. signals on each of the inputs and at the output of vertical sync. extractor. The information from all detectors is provided in the I²C bus status register (5 flags: $VDet$, $HVDet$, $VExtrDet$, $VPol$, $HVPol$). The device is equipped with an automatic mode (switched on or off by $VSynAuto$ I²C bus bit) that also uses the detection information.

Figure 2. Horizontal sync signal

10.2.2 - Sync. presence detection flags

The sync. signal presence detection flags in the status register ([VDet](#), [HVDet](#), [VExtrDet](#)) do not show in real time the presence or absence of the corresponding sync. signal. They are latched to 1 as soon as a single sync. pulse is detected. In or-

der to reset them to 0 (all at once), a 1 must be written into [SDetReset](#) I²C bus bit, the reset action taking effect with ACK bit of the I²C bus transfer to the register containing the [SDetReset](#) bit. The detection circuits are then ready to capture another event (pulse). See [Note 47](#).

Figure 3. Extraction of V-sync signal from H/V-sync signal

10.2.3 - MCU controlled sync. selection mode
I²C bus bit [VSyncAuto](#) is set to 0. The MCU reads the polarity and signal presence detection flags, after setting the [SDetReset](#) bit to 1 and an appropriate delay, to obtain a true information of the signals applied, reads and evaluates this information and controls the vertical signal selector accordingly. The MCU has no access to polarity inverters, they are controlled automatically.

See also chapter [I²C BUS CONTROL REGISTER MAP](#) on [page 21](#).

10.2.4 - Automatic sync. selection mode

I²C bus bit [VSyncAuto](#) is set to 1. In this mode, the device itself controls the I²C bus bits switching the polarity inverters ([HVPol](#), [VPol](#)) and the vertical sync. signal selector ([VSyncSel](#)), using the information provided by detection circuitry. If both extracted and pure vertical sync. signals are present, the one already selected is maintained. No intervention of the MCU is necessary.

10.3 - HORIZONTAL SECTION

10.3.1 - General

The horizontal section consists of two PLLs with various adjustments and corrections, working on horizontal deflection frequency, then phase shifting and output driving circuitry providing H-drive signal on [HOut](#) pin. Input signal to the horizontal section is output of the polarity inverter on [H/HVSyn](#) input. The device ensures automatically that this polarity be always positive.

10.3.2 - PLL1

The PLL1 block diagram is in [Figure 5](#). It consists of a voltage-controlled oscillator (VCO), a shaper with adjustable threshold, a charge pump with inhibition circuit, a frequency and phase comparator and timing circuitry. The goal of the PLL1 is to make the VCO ramp signal match in frequency the sync. signal and to lock this ramp in phase to the sync. signal, with a possibility to adjust a permanent phase offset. On the screen, this offset re-

sults in the change of horizontal position of the picture. The loop, by tuning the VCO accordingly, gets and maintains in coincidence the rising edge of input sync. signal with signal REF1, which is derived from the VCO ramp by a comparator with threshold adjustable through *HPOS* I²C bus control. The coincidence is identified and flagged by lock detection circuit on pin *HLck/VBk* as well as by *HLck* I²C bus flag.

The charge pump provides positive and negative currents charging the external loop filter on *HPosF* pin. The loop is independent of the trailing edge of sync. signal and only locks to its leading edge. By design, the PLL1 does not suffer from any dead band even while locked. The speed of the PLL1 depends on the current value provided by the charge pump. While not locked, the current is very low, to slow down the changes of VCO frequency and thus protect the external power components at sync. signal change. In locked state, the currents are much higher, two different values being selectable via *PLL1Pump* I²C bus bit to provide a mean to control the PLL1 speed by S/W. Lower values make the PLL1 slower, but more stable. Higher values make it faster and less stable. In general, the PLL1 speed should be higher for high deflection frequencies. The response speed and stability (jitter level) depends on the choice of external components making up the loop filter. A

“CRC” filter is generally used (see [Figure 4 on page 27](#)).

Figure 4. H-PLL1 filter configuration

The PLL1 is internally inhibited during extracted vertical sync. pulse (if any) to avoid taking into account missing or wrong pulses on the phase comparator. Inhibition is obtained by forcing the charge pump output to high impedance state. The inhibition mechanism can be disabled through *PLL1Pump* I²C bus bit.

The [Figure 7](#), in its upper part, shows the position of the VCO ramp signal in relation to input sync. pulse for three different positions of adjustment of horizontal position control *HPOS*.

Figure 5. Horizontal PLL1 block diagram

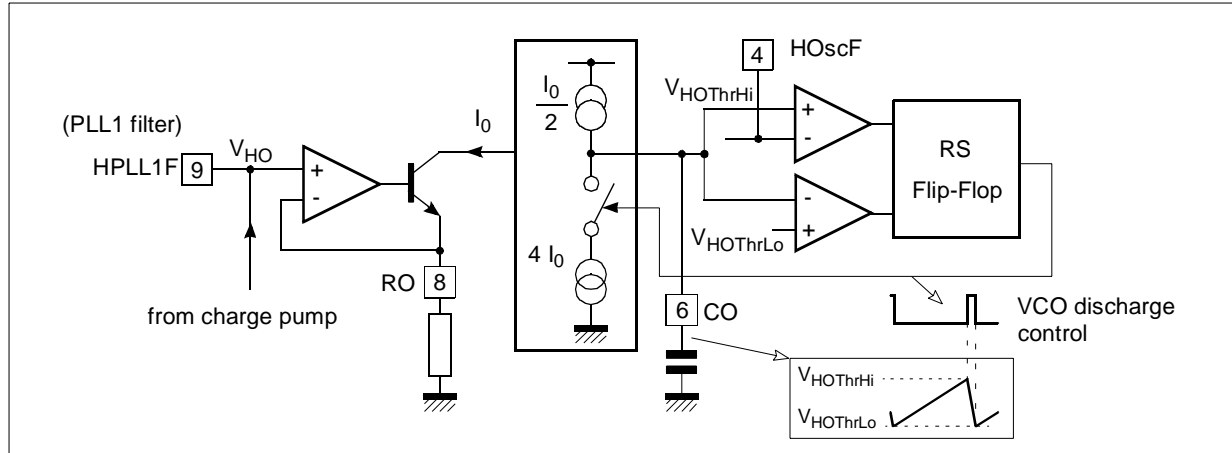

Figure 6. Horizontal oscillator (VCO) schematic diagram

10.3.3 - Voltage controlled oscillator

The VCO makes part of both PLL1 and PLL2 loops, being an “output” to PLL1 and “input” to PLL2. It delivers a linear sawtooth. Figure 6 explains its principle of operation. The linears are obtained by charging and discharging an external capacitor on pin CO, with currents proportional to the current forced through an external resistor on pin RO, which itself depends on the input tuning voltage V_{HO} (filtered charge pump output). The rising and falling linears are limited by $V_{HOThrLo}$ and $V_{HOThrHi}$ thresholds filtered through HOscF pin.

At no signal condition, the V_{HO} tuning voltage is clamped to its minimum (see chapter ELECTRICAL PARAMETERS AND OPERATING CONDITIONS, part horizontal section), which corresponds to the free-running VCO frequency $f_{HO(0)}$. Refer to Note 1 for the formula to calculate this frequency using external components values. The ratio between the frequency corresponding to maximum V_{HO} and the one corresponding to minimum V_{HO} (free-running frequency) is about 4.5. This range can easily be increased in the application. The PLL1 can only lock to input frequencies falling inside these two limits.

10.3.4 - PLL2

The goal of the PLL2 is, by means of phasing the signal driving the power deflection transistor, to lock the middle of the horizontal flyback to a certain threshold of the VCO sawtooth. This internal threshold is affected by geometry phase corrections, like e.g., parallelogram. The PLL2 is much faster than PLL1 to be able to follow the dynamism of this phase modulation. The PLL2 control current (see Figure 7) is significantly increased during discharge of vertical oscillator (during vertical retrace period) to be able to make up for the difference of dynamic phase at the bottom and at the top of the picture. The PLL2 control current is integrated on

the external filter on pin HPLL2C to obtain smoothed voltage, used, in comparison with VCO ramp, as a threshold for H-drive rising edge generation.

As both leading and trailing edges of the H-drive signal in the Figure 7 must fall inside the rising part of the VCO ramp, an optimum middle position of the threshold has been found to provide enough margin for horizontal output transistor storage time as well as for the trailing edge of H-drive signal with maximum duty cycle. Yet, the constraints thereof must be taken into account while considering the application frequency range and H-flyback duration. The Figure 7 also shows regions for rising and falling edges of the H-drive signal on HOut pin. As it is forced high during the H-flyback pulse and low during the VCO discharge period, no edge during these two events takes effect.

The flyback input configuration is in Figure 8.

10.3.5 - Dynamic PLL2 phase control

The dynamic phase control of PLL2 is used to compensate for picture asymmetry versus vertical axis across the middle of the picture. It is done by modulating the phase of the horizontal deflection with respect to the incoming video (synchronization). Inside the device, the threshold $V_{S(0)}$ is compared with the VCO ramp, the PLL2 locking the middle of H-flyback to the moment of their match. The dynamic phase is obtained by modulation of the threshold by correction waveforms. Refer to Figure 12 and to chapter TYPICAL OUTPUT WAVEFORMS. The correction waveforms have no effect in vertical middle of the screen (for middle vertical position). As they are summed, their effect on the phase tends to reach maximum span at top and bottom of the picture. As all the components of the resulting correction waveform (linear for parallelogram correction and parabola of 2nd order for Pin cushion asymmetry correction) are

generated from the output vertical deflection drive waveform, they both track with real vertical amplitude and position (including breathing compensation), thus being fixed on the screen. Refer to [I²C BUS CONTROL REGISTER MAP](#) on page 21 for details on I²C bus controls.

Figure 7. Horizontal timing diagram

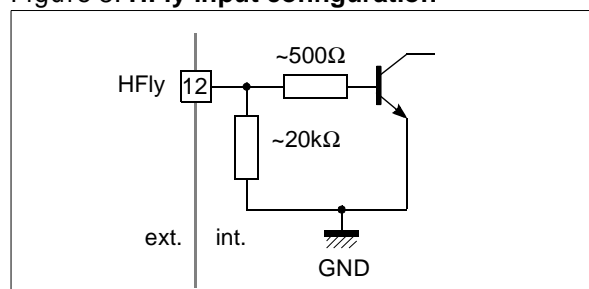

Figure 8. HFly input configuration

10.3.6 - Output Section

The H-drive signal is inhibited (high level) during flyback pulse, and also when V_{CC} is too low, when X-ray protection is activated ([XRayAlarm](#) I²C bus flag set to 1) and when I²C bus bit [HBOutEn](#) is set to 0 (default position).

The duty cycle of the H-drive signal is controlled via I²C bus register [HDUTY](#). This is overruled during soft-start and soft-stop procedures (see sub chapter [Soft-start and soft-stop on H-drive](#) on page 29 and Figure 10).

The PLL2 is followed by a rapid phase shifting which accepts the signal from H-moiré canceller (see sub chapter [Horizontal moiré cancellation](#) on page 29)

The output stage consists of a NPN bipolar transistor, the collector of which is routed to [HOut](#) pin (see Figure 9).

Figure 9. HOut configuration

Non-conductive state of HOT (Horizontal Output Transistor) must correspond to non-conductive state of the device output transistor.

10.3.7 - Soft-start and soft-stop on H-drive

The soft-start and soft-stop procedure is carried out at each switch-on or switch-off of the H-drive signal, either via [HBOutEn](#) I²C bus bit or after reset of [XRayAlarm](#) I²C bus flag, to protect external power components. By its second function, the external capacitor on pin [HPosF](#) is used to time out this procedure, during which the duty cycle of H-drive signal starts at its maximum (t_{Hoff}/T_H for soft start/stop" in electrical specifications) and slowly decreases to the value determined by the control I²C bus register [HDUTY](#) (vice versa at soft-stop). This is controlled by voltage on pin [HPosF](#). See Figure 10 and sub chapter [Safety functions](#) on page 36.

10.3.8 - Horizontal moiré cancellation

The horizontal moiré canceller is intended to blur a potential beat between the horizontal video pixel period and the CRT pixel width, which causes visible moiré patterns in the picture.

On pin [HMoiré](#), in position "External" of I²C bus bit [HMoiMode](#), it generates a square line-synchronized waveform with amplitude adjustable through [HMOIRE](#) I²C bus control. In position "Internal" of I²C bus bit [HMoiMode](#), it introduces a microscopic indent on horizontal scan lines by injecting little controlled phase shifts to output circuitry of the horizontal section. Their amplitude is adjustable through [HMOIRE](#) I²C bus control.

Only one H-moiré, internal or external, is generated at a time.

The behaviour of horizontal moiré is to be optimised for different deflection design configurations using **HMoire** I²C bus bit. This bit is to be kept at 0

for common architecture (B+ and EHT common regulation) and at 1 for separated architecture (B+ and EHT each regulated separately).

Figure 10. **Control of HOut and BOut at start/stop at nominal V_{cc}**

10.4 - VERTICAL SECTION

10.4.1 - General

The goal of the vertical section is to drive vertical deflection output stage. It delivers a sawtooth waveform with an amplitude independent of deflection frequency, on which vertical geometry corrections of C- and S-type are superimposed (see chapter **TYPICAL OUTPUT WAVEFORMS**).

Block diagram is in **Figure 11**. The sawtooth is obtained by charging an external capacitor on pin **VCap** with controlled current and by discharging it via transistor Q1. This is controlled by the CONTROLLER. The charging starts when the voltage across the capacitor drops below **V_{VOB}** threshold. The discharging starts either when it exceeds **V_{VOT}** threshold or a short time after arrival of synchronization pulse. This time is necessary for the AGC loop to sample the voltage at the top of the sawtooth. The **V_{VOB}** reference is routed out onto **VO-scF** pin in order to allow for further filtration.

The charging current influences amplitude and shape of the sawtooth. Just before the discharge, the voltage across the capacitor on pin **VCap** is sampled and stored on a storage capacitor connected on pin **VAGCCap**. During the following vertical period, this voltage is compared to internal

reference REF (**V_{VOT}**), the result thereof controlling the gain of the transconductance amplifier providing the charging current. Speed of this AGC loop depends on the storage capacitance on pin **VAGCCap**. The **VLock** I²C bus flag is set to 1 when the loop is stabilized, i.e. when the voltage on pin **VAGCCap** matches **V_{VOT}** value. On the screen, this corresponds to stabilized vertical size of picture. After a change of frequency on the sync. input, the stabilization time depends on the frequency difference and on the capacitor value. The lower its value, the shorter the stabilization time, but on the other hand, the lower the loop stability. A practical compromise is a capacitance of 470nF. The leakage current of this capacitor results in difference in amplitude between low and high frequencies. The higher its parallel resistance **R_{L(VAGCCap)}**, the lower this difference.

When the synchronization pulse is not present, the charging current is fixed. As a consequence, the free-running frequency **f_{VO(0)}** only depends on the value of the capacitor on pin **VCap**. It can be roughly calculated using the following formula

$$f_{VO(0)} = \frac{150\text{nF}}{C_{(VCap)}} \cdot 100\text{Hz}$$

The frequency range in which the AGC loop can regulate the amplitude also depends on this capacitor.

The C- and S-corrections of shape serve to compensate for the vertical deflection system non-linearity. They are controlled via **CCOR** and **SCOR** I²C bus controls.

Shape-corrected sawtooth with regulated amplitude is lead to amplitude control stage. The discharge exponential is replaced by **V_{VOB}** level, which, under control of the CONTROLLER, creates a rapid falling edge and a flat part before beginning of new ramp. Mean value of the waveform output on pin **V_{Out}** is adjusted by means of **V_{POS}** I²C bus control, its amplitude through **V_{SIZE}** I²C bus control. Vertical moiré is superimposed.

The biasing voltage for external DC-coupled vertical power amplifier is to be derived from **V_{RefO}** voltage provided on pin **RefOut**, using a resistor divider, this to ensure the same temperature drift of mean (DC) levels on both differential inputs and to compensate for spread of **V_{RefO}** value (and so mean output value) between particular devices.

10.4.2 - Vertical moiré

To blur the interaction of deflection lines with CRT mask grid pitch that can generate moiré pattern, the picture position is to be alternated at half-frame frequency. For this purpose, a square waveform at half-frame frequency is superimposed on the output waveform's DC value. Its amplitude is adjustable through **V_{MOIRE}** I²C bus control,.

Figure 11. Vertical section block diagram

10.5 - EW DRIVE SECTION

The goal of the EW drive section is to provide, on pin **EWOut**, a waveform which, used by an external DC-coupled power stage, serves to compensate for those geometry errors of the picture that are symmetric versus vertical axis across the middle of the picture.

The waveform consists of an adjustable DC value, corresponding to horizontal size, a parabola of 2nd order for “pin cushion” correction, a linear for “key-stone” correction and independent half-parabolas of 4th order for top and bottom corner corrections. All of them are adjustable via I²C bus, see **I²C BUS CONTROL REGISTER MAP** on [page 21](#) chapter.

Refer to [Figure 12](#), [Figure 13](#) and to chapter **TYPICAL OUTPUT WAVEFORMS**. The correction waveforms have no effect in the vertical middle of the screen (if the **VPOS** control is adjusted to its medium value). As they are summed, the resulting waveform tends to reach its maximum span at top and bottom of the picture. The voltage at the **EWOut** is top and bottom limited (see parameter **V_{EW}**). According to [Figure 13](#), especially the bottom limitation seems to be critical for maximum horizontal size (minimum DC). Actually it is not critical since the parabola component must always

be applied. As all the components of the resulting correction waveform are generated from the output vertical deflection drive waveform, they all track with real vertical amplitude and position (including breathing compensation), thus being fixed vertically on the screen. They are also affected by C- and S-corrections. The sum of components other than DC is affected by value in **HSIZE** I²C bus control in reversed sense. Refer to electrical specifications for value. The DC value, adjusted via **HSIZE** control, is also affected by voltage on **HE-HTIn** input, thus providing a horizontal breathing compensation (see electrical specifications for value). The resulting waveform is conditionally multiplied with voltage on **HPLL1F**, which depends on frequency. Refer to electrical specifications for value and more precision. This tracking with frequency provides a rough compensation of variation of picture geometry with frequency and allows to fix the adjustment ranges of I²C bus controls throughout the operating range of horizontal frequencies. It can be switched off by **EWTrHFr** I²C bus bit (off by default).

The EW waveform signal is buffered by an NPN emitter follower, the emitter of which is routed to **EWOut** output, with an internal resistor to ground.

Figure 12. **Geometric corrections'** schematic diagram

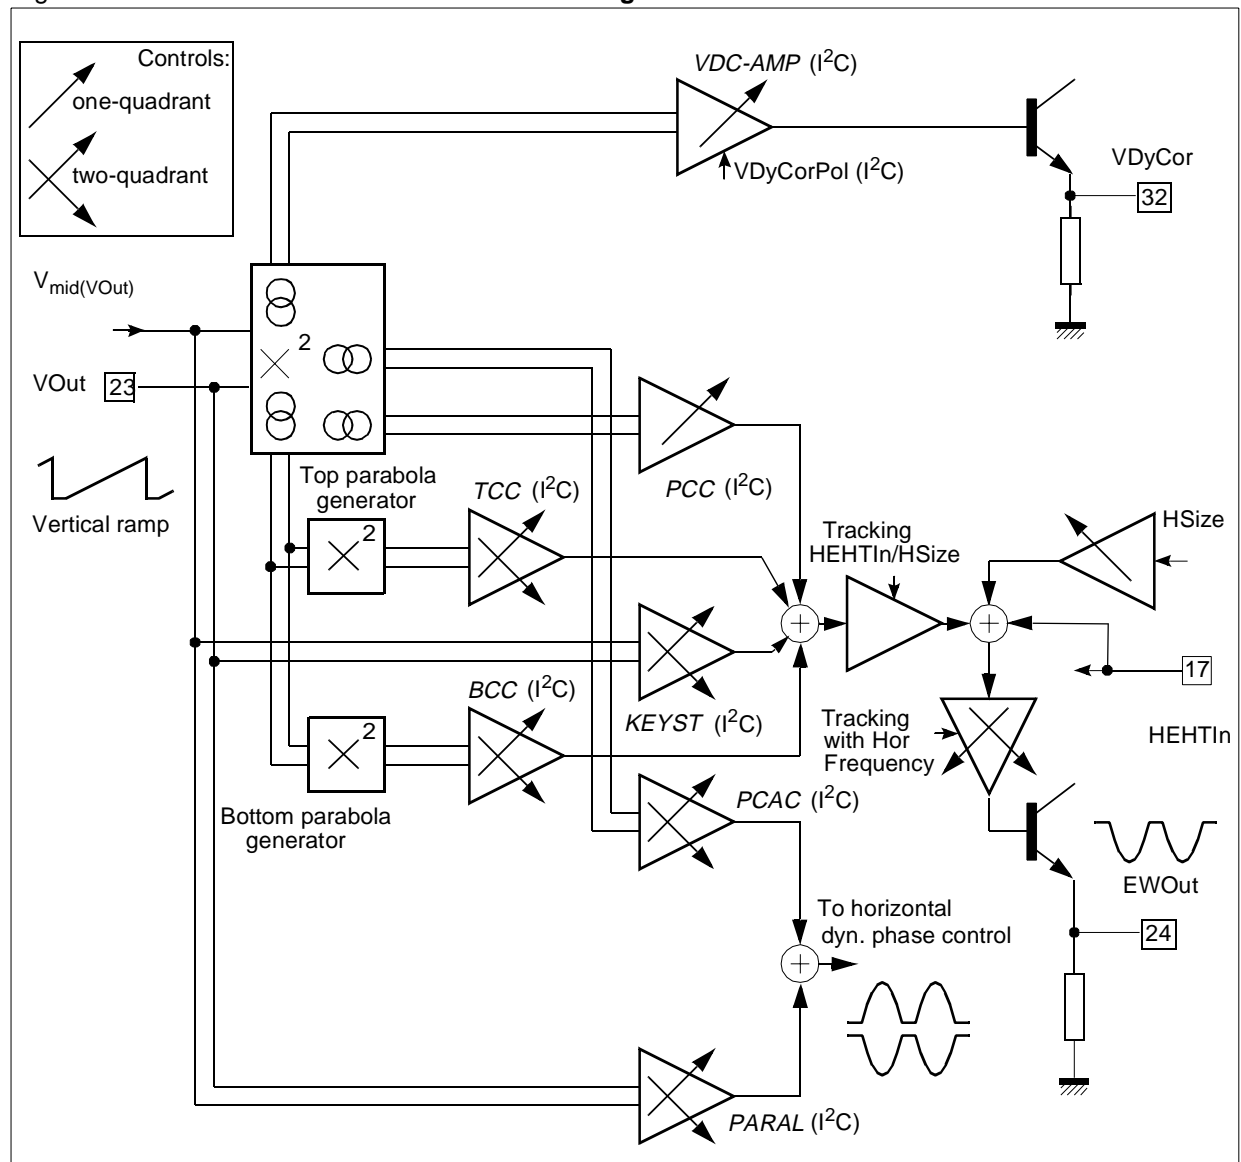

Figure 13. EWOut output waveforms

10.6 - DYNAMIC CORRECTION OUTPUT SECTION

10.6.1 - Vertical dynamic correction output VDyCor

A parabola at vertical deflection frequency is available on pin **VDyCor**. Its amplitude is adjustable via **VDC-AMP** I²C bus control and polarity controlled via **VDyCorPol** I²C bus bit. It tracks with real vertical amplitude and position (including breathing

compensation). It is also affected by C- and S-corrections.

The signal is buffered by an NPN emitter follower, the emitter of which is routed to V_DyCor output, with an internal resistor to ground

The use of the correction waveform is up to the application (e.g. dynamic focus).

10.7 - DC/DC CONTROLLER SECTION

The section is designed to control a switch-mode DC/DC converter. A switch-mode DC/DC converter generates a DC voltage from a DC voltage of different value (higher or lower) with little power losses. The DC/DC controller is synchronized to horizontal deflection frequency to minimize potential interference into the picture.

Its operation is similar to that of standard UC3842.

The schematic diagram of the DC/DC controller is in [Figure 14](#). The **BOut** output controls an external

switching circuit (a MOS transistor) delivering pulses synchronized on horizontal deflection frequency, the phase of which depends on I²C bus configuration, see the table at the end of this chapter. Their duration depends on feedback provided to the circuit, generally a copy of DC/DC converter output voltage and a copy of current passing through the DC/DC converter circuitry (e.g. current through external power component). A NPN transistor open-collector is routed out to the **BOut** pin.

During the operation, a sawtooth is to be found on pin **BISense**, generated externally by the application. According to **BOutPh** I²C bus bit, the R-S flip-flop is set either at H-drive signal edge (rising or falling, depending on **BOHEdge** I²C bus bit), or a certain delay ($t_{BTrigDel} / T_H$) after middle of H-flyback. The output is set On at the end of a short pulse generated by the monostable trigger.

Timing of reset of the R-S flip-flop affects duty cycle of the output square signal and so the energy transferred from DC/DC converter input to its output. A reset edge is provided by comparator C2 if the voltage on pin **BISense** exceeds the internal threshold $V_{ThrBlsCurr}$. This represents current limitation if a voltage proportional to the current through the power component or deflection stage is available on pin **BISense**. This threshold is affected by the voltage on pin **HPosF**, which rises at soft start and descends at soft stop. This ensures self-contained soft control of duty cycle of the output signal on pin **BOut**. Refer to Figure 10. Another condition for the reset of the R-S flip-flop, OR-ed

with the one described before, is that the voltage on pin **BISense** exceeds the voltage V_{C1} , which depends on the voltage applied on input **BISense** of the error amplifier O1. The two voltages are compared, and the reset signal generated by the comparator C1. The error amplifier amplifies (with a factor defined by external components) the difference between the input voltage proportional to DC/DC converter output voltage and internal reference V_{BReg} . The internal reference and so the output voltage is I²C bus adjustable by means of **BREF** I²C bus control.

Figure 14. DC/DC converter controller block diagram

10.8 - MISCELLANEOUS

10.8.1 - Safety functions

The safety functions comprise supply voltage monitoring with appropriate actions, soft start and soft stop features on H-drive and B-drive signals on **HOut** and **BOut** outputs and X-ray protection.

For supply voltage supervision, refer to paragraph [Power supply and voltage references](#) on [page 25](#) and [Figure 1](#). A schematic diagram putting together all safety functions and composite PLL1 lock and V-blanking indication is in [Figure 15](#).

10.8.2 - Soft start and soft stop functions

For soft start and soft stop features for H-drive and B-drive signal, refer to paragraph [Soft-start and soft-stop on H-drive](#) on [page 29](#) and sub chapter-[DC/DC CONTROLLER SECTION](#) on [page 34](#), respectively. See also the [Figure 10](#). Regardless why the H-drive or B-drive signal are switched on or off (I²C bus command, power up or down, X-ray protection), the signals always phase-in and phase-out in the way drawn in the figure, the first to phase-in and last to phase-out being the H-drive

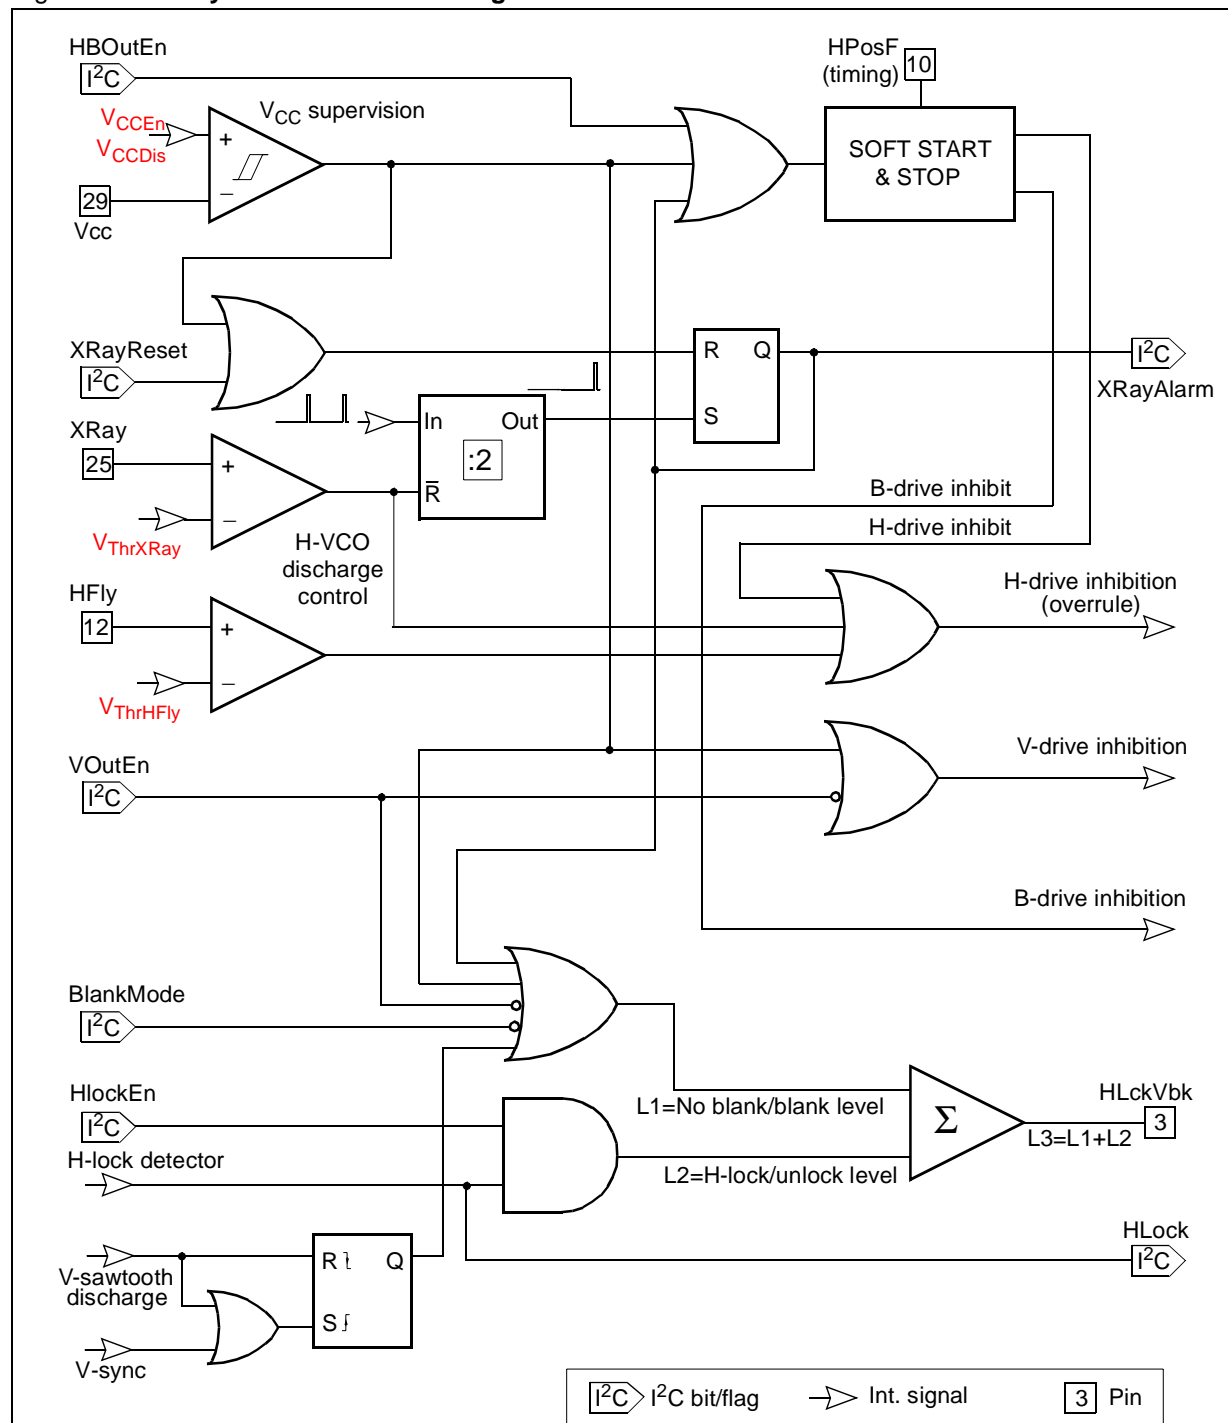

signal, which is to better protect the power stages at abrupt changes like switch-on and off. The timing of phase-in and phase-out only depends on the capacitance connected to **HPosF** pin which is virtually unlimited for this function. Yet it has a dual function (see paragraph [PLL1](#) on [page 26](#)), so a compromise thereof is to be found.

10.8.3 - X-ray protection

The X-ray protection is activated if the voltage level on **XRay** input exceeds **V_{ThrXRay}** threshold. As a consequence, the H-drive and B-drive signals on **HOut** and **BOut** outputs are inhibited (switched off) after a 2-horizontal deflection line delay provided to avoid erratic excessive X-ray condition detection at short parasitic spikes. The **XRayAlarm** I²C bus flag is set to 1 to inform the MCU.

This protection is latched; it may be reset either by **V_{CC}** drop or by I²C bus bit **XRayReset** (see chapter [I²C BUS CONTROL REGISTER MAP](#) on [page 21](#)).

Figure 15. Safety functions - block diagram

10.8.4 - Composite output HLckVBk

The composite output HLckVBk provides, at the same time, information about lock state of PLL1 and early vertical blanking pulse. As both signals have two logical levels, a four level signal is used to define the combination of the two. Schematic diagram putting together all safety functions and composite PLL1 lock and V-blanking indication is in Figure 15, the combinations, their respective levels and the HLckVBk configuration in Figure 16.

The early vertical blanking pulse is obtained by a logic combination of vertical synchronization pulse and pulse corresponding to vertical oscillator discharge. The combination corresponds to the drawing in Figure 16. The blanking pulse is started with

the leading edge of any of the two signals, whichever comes first. The blanking pulse is ended with the trailing edge of vertical oscillator discharge pulse. The device has no information about the vertical retrace time. Therefore, it does not cover, by the blanking pulse, the whole vertical retrace period. By means of BlankMode I²C bus bit, when at 1 (default), the blanking level (one of two according to PLL1 status) is made available on the HLckVBk permanently. The permanent blanking, irrespective of the BlankMode I²C bus bit, is also provided if the supply voltage is low (under V_{CCEn} or V_{CCDis} thresholds), if the X-ray protection is active or if the V-drive signal is disabled by VOutEn I²C bus bit.
