

**SATELLITE SOUND AND VIDEO PROCESSOR****SOUND**

- TWO INDEPENDENT SOUND DEMODULATORS
- PLL DEMODULATION WITH 5-10MHz FREQUENCY SYNTHESIS
- PROGRAMMABLE FM DEMODULATOR BANDWIDTH ACCOMODATING FM DEVIATIONS FROM  $\pm 30\text{kHz}$  TILL  $\pm 400\text{kHz}$
- PROGRAMMABLE 50/75 $\mu\text{s}$ , J17 OR NO DE-EMPHASIS
- WEGENER PANDA SYSTEM
- TWO AUXILIARY AUDIO INPUTS AND OUTPUTS
- GAIN CONTROLLED AND MUTEABLE AUDIO OUTPUTS
- HIGH IMPEDANCE MODE AUDIO OUTPUTS FOR TWIN TUNER APPLICATIONS

**VIDEO**

- COMPOSITE VIDEO 6-bit 0 to 12.7dB GAIN CONTROL
- COMPOSITE VIDEO SELECTABLE INVERTER
- TWO SELECTABLE VIDEO DE-EMPHASIS NETWORKS
- 6 x 3 VIDEO MATRIX
- BLACK LEVEL ADJUSTABLE OUTPUT FOR ON-BOARD VIDEOCRYPT DECODER
- HIGH IMPEDANCE MODE VIDEO OUTPUTS FOR TWIN TUNER APPLICATIONS

**MISCELLANEOUS**

- 22kHz TONE GENERATION FOR LNB CONTROL
- I<sup>2</sup>C BUS CONTROL  
CHIP ADDRESSES = 06<sub>HEX</sub> OR 46<sub>HEX</sub>
- LOW POWER STAND-BY MODE WITH ACTIVE AUDIO AND VIDEO MATRIXES

**DESCRIPTION**

The STV0056AF BICMOS integrated circuit realizes all the necessary signal processing from the tuner to the Audio/Video input and output connectors regardless the satellite system.

**TQFP64 (10 x 10mm)**  
(Thin Plastic Quad Flat Pack)

**ORDER CODE :** STV0056AF

PIN CONNECTIONS

PIN ASSIGNMENT

Pin Number	Name	Function
1	GND	Connected to the Lead Frame
2	S2 VID OUT	VCR-Scart 2 Video Output
3	VOL L	Volume Controlled Audio Out Left
4	S2 VID RTN	VCR-Scart 2 Video Return
5	S2 OUT L	Fixed Level Audio Output Left (to VCR)
6	CLAMP IN	Sync-Tip Clamp Input
7	S2 OUT R	Fixed Level Audio Output Right (to VCR)
8	UNCL DEEM	Unclamped Deemphasized Video Output
9	VIDEEM2/22kHz	Video Deemphasis 2 or 22kHz Output
10 - 11	V 12V	Video 12V Supply
12	VIDEEM1	Video Deemphasis 1
13 - 14	V GND	Video Ground
15	NC	
16	B-BAND IN	Base Band Input
17	S2 RTN L	Auxiliary Audio Return Left (from VCR)
18	S2 RTN R	Auxiliary Audio Return Right (from VCR)
19	FM IN	FM Demodulator Input
20	S3 RTN L	Auxiliary Audio Return Left (from decoder)

## PIN ASSIGNMENT (continued)

Pin Number	Name	Function
21	S3 RTN R	Auxiliary Audio Return Right (from decoder)
22	AGC L	AGC Peak Detector Capacitor Left
23	S3 OUT L	Auxiliary Audio Output L (to decoder)
24	S3 OUT R	Auxiliary Audio Output R (to decoder)
25	I/O/22kHz	Digital Input/Output or 22kHz Output
26	SCL	I <sup>2</sup> C Bus Clock
27	SDA	I <sup>2</sup> C Bus Data
28	HA	Hardware Address

64	S1 VID OUT	TV-Scart 1 Video Output

0056F-01.TBL

## PIN DESCRIPTION

### 1 - Sound Detection

#### **FMIN**

This is the input to the two FM demodulators. It feeds two AGC amplifiers with a bandwidth of at least 5-10MHz. There is one amplifier for each channel both with the same input. The AGC amplifiers have a 0dB to +40dB range.

$Z_{IN} = 5k\Omega$ , Min input = 2mV<sub>PP</sub> per subcarrier.

Max input = 500mV<sub>PP</sub> (max when all inputs are added together, when their phases coincide).

#### **AGC L, AGC R**

AGC amplifiers peak detector capacitor connections. The output current has an attack/decay ratio of 1:32. That is the ramp up current is approximately 5 $\mu$ A and decay current is approximately 160 $\mu$ A. 11V gives maximum gain. These pins are also driven by a circuit monitoring the voltage on AMPLK L and AMPLK R respectively.

#### **AMPLK L, AMPLK R**

The outputs of amplitude detectors LEFT and RIGHT. Each requires a capacitor and a resistor to GND. The voltage across this is used to decide whether there is a signal being received by the FM detector. The level detector output drives a bit in the detector I<sup>2</sup>C bus control block.

AMPLK L and AMPLK R drive also respectively AGC L and AGC R. For instance when the voltage on AMPLK L is > (V<sub>REF</sub> + 1 V<sub>BE</sub>) it sinks current to V<sub>REF</sub> from pin AGC L to reduce the AGC gain.

#### **DET L, DET R**

Respectively the outputs of the FM phase detector left and right.

This is for the connection of an external loop filter for the PLL. The output is a push-pull current source.

#### **CPUMPL, CPUMPR**

The output from the frequency synthesizer is a push-pull current source which requires a capacitor

to ground to derive a voltage to pull the VCO to the target frequency. The output is  $\pm 100\mu$ A to achieve lock and  $\pm 2\mu$ A during lock to provide a tracking time constant of approximately 10Hz.

#### **V<sub>REF</sub>**

This is the audio processor voltage reference used through out the FM/audio section of the chip. As such it is essential that it is well decoupled to ground to reduce as far as possible the risk of crosstalk and noise injection. This voltage is derived directly from the bandgap reference of 2.4V. The V<sub>REF</sub> output can sink up to 500 $\mu$ A in normal operation and 100 $\mu$ A when in stand-by.

#### **I<sub>REF</sub>**

This is a buffered V<sub>REF</sub> output to an off-chip resistor to produce an accurate current reference, within the chip, for the biasing of amplifiers with current outputs into filters. It is also required for the Noise reduction circuit to provide accurate roll-off frequencies. This pin should not be decoupled as it would inject current noise. The target current is 50 $\mu$ A  $\pm 2\%$  thus a 47.5k $\Omega$   $\pm 1\%$  is required.

#### **A 12V**

Double bonded main power pin for the audio/FM section of the chip. The two bond connections are to the ESD and to power the circuit and on chip regulators/references.

#### **A GND L**

This ground pin is double bonded :

- 1) to channel LEFT : RF section & VCO,
- 2) to both AGC amplifiers, channel LEFT and RIGHT audio filter section.

#### **A GND R**

This ground pin is double bonded :

- 1) to the volume control, noise reduction system, ESD + Mux + V<sub>REF</sub>
- 2) to channel right : RF section & VCO

**PIN DESCRIPTION** (continued)**2 - Baseband Audio Processing*****PK OUT L, PK OUT R, PK OUT***

The noise reduction control loop peak detector output requires a capacitor to ground from this pin, and a resistor to  $V_{REF}$  pin to give some accurate decay time constant. An on chip  $5k\Omega \pm 25\%$  resistor and external capacitor give the attack time.

***PK IN L, PK IN R or PK IN***

Each of these pins is an input to a control loop peak detector and is connected to the output of the off-chip control loop band pass filter.

***LEVEL L, LEVEL R***

Respectively the audio left and right signals of the FM demodulators are output to level L and level R pins through an input follower buffer. The off-chip filters driven by these pins must include AC coupling to the next stage (PK IN L and PK IN R pins respectively).

***FC L, FC R***

The variable bandwidth transconductance amplifier has a current output which is variable depending on the input signal amplitude as defined by the control loop of the noise reduction. The output current is then dumped into an off-chip capacitor which together with the accurate current reference define the min/max rolloff frequencies. A resistor in series with a capacitor is connected to ground from these two pins.

***J17 L, J17 R***

The external J17 de-emphasis networks for channels left and right. The amplifier for this filter is voltage input, current output. Output with  $\pm 500mV$  input will be  $\pm 55\mu A$ .

To perform J17 de-emphasis with the STV0042, an external circuit is required.

***U75 L, U75 R***

External deemphasis networks for channels left and right. For each channel a capacitor and resistor in parallel of  $75\mu s$  time constant are connected between here and  $V_{REF}$  to provide  $75\mu s$  de-emphasis. Internally selectable is an internal resistor that can be programmed to be added in parallel thereby converting the network to approx  $50\mu s$  de-emphasis (see control block map). The value of the internal resistors is  $54k\Omega \pm 30\%$ . The amplifier for this filter is voltage input, current output ; with  $\pm 500mV$  input the output will be  $\pm 55\mu A$ .

***VOL L, VOL R***

The main audio output from the volume control amplifier the signal to get output signals as high as  $2V_{RMS}$  (+12dB) on a DC bias of 4.8V. Control is from +12dB to -26.75dB plus Mute with 1.25dB steps. This amplifier has short circuit protection and is intended to drive a SCART connector directly via AC coupling and meets the standard SCART drive requirements. These outputs feature high impedance mode for parallel connection.

***S2 OUT L, S2 OUT R, S3 OUT L, S3 OUT R***

These audio outputs are sourced directly from the audio MUX, and as a result do not include any volume control function. They will output a  $1V_{RMS}$  signal biased at 4.8V. They are short circuit protected. These outputs feature high impedance mode for parallel connection and meet SCART drive requirement.

***S2 RTN L, S2 RTN R, S3 RTN L, S3 RTN R***

These pins allow auxiliary audio signals to be connected to the audio processor and hence makes use of the on-chip volume control. For additional details please refer to the audio switching table.

**PIN DESCRIPTION** (continued)**3 - Video Processing****B-BAND IN**

AC-coupled video input from a tuner.  
 $Z_{IN} > 10k\Omega \pm 25\%$ . This drives an on-chip video amplifier. The other input of this amp is AC grounded by being connected to an internal  $V_{REF}$ . The video amplifier has selectable gain from 0dB to 12.7dB in 63 steps and its output signal can be selected normal or inverted.

**UNCL DEEM**

Deemphasized still unclamped output. It is also an input of the video matrix.

**VIDEEM1**

Connected to an external de-emphasis network (for instance 625 lines PAL de-emphasis).

**VIDEEM2/ 22kHz**

Connected to an external de-emphasis network (for instance 525 lines NTSC or other video de-emphasis). Alternatively a precise 22kHz tone may be output by I<sup>2</sup>C bus control.

**CLAMP IN**

This pin clamps the most negative extreme of the input (the sync tips) to  $2.7V_{DC}$  (or appropriate voltage). The video at the clamp input is only  $1V_{PP}$ . This clamped video which is de-emphasised, filtered and clamped (energy dispersal removed) is normal, negative syncs, video. This signal drives the Video Matrix input called Normal Video. It has a weak ( $1.0\mu A \pm 15\%$ ) stable current source pulling the input towards GND. Otherwise the input impedance is very high at DC to 1kHz  $Z_{IN} > 2M\Omega$ . Video bandwidth through this is -1dB at 5.5MHz. The CLAMP input DC restore voltage is then used as a means for getting the correct DC voltage on the SCART outputs.

**S3 VID RTN**

This input can be driven for instance by the decoder. This input has a DC restoration clamp on its input. The clamp sink current is  $1\mu A \pm 15\%$  with the buffer  $Z_{IN} > 1M\Omega$ .

**S2 VID RTN, S1 VID RTN**

External video input  $1.0V_{pp}$  AC coupled  $75\Omega$  source impedance. This input has a DC restoration clamp on its input. The clamp sink current is  $1\mu A \pm 15\%$  with the buffer  $Z_{IN} > 1M\Omega$ . This signal is an input to the Video Matrix.

**S1 VID OUT, S2 VID OUT**

Video drivers for SCART 1 and SCART 2. An external emitter follower buffer is required to drive a  $150\Omega$  load. The average DC voltage to be  $1.5V$

on the O/P. The signal is video  $2.0V_{PP}$  5.5MHz BW with sync tip =  $1.2V$ . These pins get signals from the Video Matrix. The signal selected from the Video Matrix for output on this pin is controlled by a control register. This output also feature a high impedance mode for parallel connection.

**S3 VID OUT**

This output can drive for instance a decoder. Also it is able to pass 10MHz ;  $Z_{OUT} < 75\Omega$ . Video on this pin will be  $2V_{PP}$ . The black level of the output video signal can be adjusted through I<sup>2</sup>C bus control to easily interface with on-board Videocrypt decoder. This output feature an high impedance mode for parallel connection.

**V 12V**

+ 12V double bonded : ESD+guard rings and video circuit power.

**V GND**

Doubled bonded. Clean VID IN GND. Strategically placed video power ground connection to reduce video currents getting into the rest of the circuit.

**4 - Control Block****GND 5V**

The main power ground connection for the control logic, registers, the I<sup>2</sup>C bus interface, synthesizer & watchdog and XTOSC.

**V<sub>DD</sub> 5V**

Digital +5V power supply.

**SCL**

This is the I<sup>2</sup>C bus clock line. Clock = DC to 100kHz. Requires external pull up eg.  $10k\Omega$  to 5V.

**SDA**

This is the I<sup>2</sup>C bus data line. Requires external pull up eg.  $10k\Omega$  to 5V.

**I/O / 22kHz**

General purpose input output pin or 22kHz output.

**XTL**

This pin allows for the on-chip oscillator to be either used with a crystal to ground of 4MHz or 8MHz, or to be driven by an external clock source. The external source can be either 4MHz or 8MHz. A programmable bit in the control block removes a +2 block when the 4MHz option is selected.

**HA**

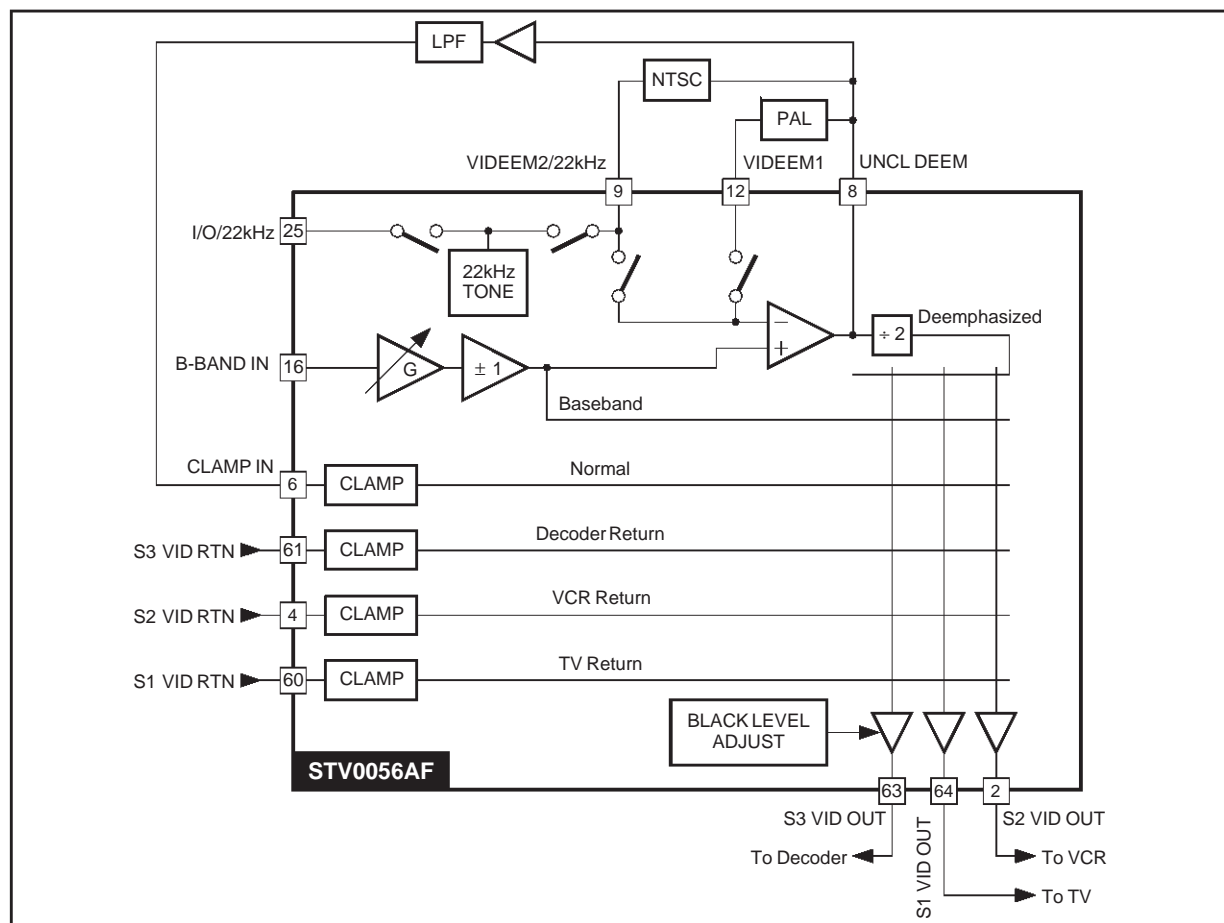

Hardware address with internal  $135\mu A$  pull down. Chip address is 06 when this pin is grounded and chip address is 46 when connected to  $V_{DD}$ .

## GENERAL BLOCK DIAGRAM

0056F-02.EPS

## VIDEO PROCESSING BLOCK DIAGRAM

0056F-03.EPS

## **CIRCUIT DESCRIPTION**

### **Video Section**

The composite video is first set to a standard level by means of a 64 step gain controlled amplifier. In the case that the modulation is negative, an inverter can be switched in.

One of two different external video de-emphasis networks (for instance PAL and NTSC) is selectable by an integrated bus controlled switch.

Then energy dispersal is removed by a sync tip clamping circuit, which is used on all inputs to a video switching matrix, thus making sure that no DC steps occur when switching video sources.

The matrix can be used to feed video to and from decoders, VCR's and TV's.

A bus controlled black level adjustment circuit is provided on the decoder output allowing a direct connection to an on-board Videocrypt decoder.

Additionally all the video outputs are tristate type (high impedance mode is supported), allowing a simple parallel connections to the scarts (Twin tuner applications).

### **Audio Section**

The two audio channels are totally independent except for the possibility given to output on both channels only one of the selected input audio channels.

To allow a very cost effective application, each channel uses PLL demodulation. Neither external complex filter nor ceramic filters are needed.

The frequency of the demodulated subcarrier is chosen by a frequency synthesizer which sets the frequency of the internal local oscillator by comparing its phase with the internally generated reference. When the frequency is reached, the microprocessor switches in the PLL and the demodulation starts. At any moment the microprocessor can read from the device (watchdog registers) the actual frequency to which the PLL is locked. It can also verify that a carrier is present at the wanted frequency (by reading AMPLK status bit) thanks to

a synchronous amplitude detector, which is also used for the audio input AGC.

In order to maintain constant amplitude of the recovered audio regardless of variations between satellites or subcarriers, the PLL loop gain may be programmed from 56 values.

Any frequency deviation can be accommodated (from  $\pm 30\text{kHz}$  till  $\pm 400\text{kHz}$ ).

Two different networks can be permanently connected for either  $75\mu\text{s}$  or J17 de-emphasis. If  $50\mu\text{s}$  de-emphasis is required, this can be inserted by an internal switch, thus allowing a worldwide application.

The STV0056AF is intended to be compatible with Wegener Panda System.

Two types of audio outputs are provided: one is a fixed  $1V_{\text{RMS}}$  and the other is a gain controlled  $2V_{\text{RMS}}$  max. The control range being from +12dB to -26.75dB with 1.25dB steps. This output can also be muted.

A matrix is implemented to feed audio to and from decoders VCR's and TV's.

Noise reduction system and de-emphasis can be inserted or by-passed through bus control.

Also all the audio outputs are tristate-type (high impedance mode is supported), allowing a simple parallel connections to the scarts (Twin tuner applications).

### **Others**

A 22kHz tone is generated for LNB control.

It is selectable by bus control and available on one of the two pins connected to the external video de-emphasis networks. One general purpose I/O is also available on the STV0056AF.

By means of the  $I^2C$  bus there is the possibility to drive the ICs into a low power consumption mode with active audio and video matrixes. Independently from the main power mode, each individual audio and video output can be driven to high impedance mode.

## PIN INTERNAL CIRCUITRY

### S1 VID RTN, S2 VID RTN, S3 VID RTN, CLAMP IN

50 $\mu$ A source is active only when VIDIN < 2.7V.

Figure 1

### S3 VID OUT

I black level is I<sup>2</sup>C programmable from source 16 $\mu$ A to sink 33 $\mu$ A equivalent to an offset voltage of -150mV to + 300mV. The 60 $\Omega$  collector resistor is for short cct. protection.

Figure 2

### S1 VID OUT, S2 VID OUT

Same as above but with no black level adjustment.

Figure 3

### UNCL DEEM

Same as above but with no black level adjustment and slightly different gain.

Figure 4

### VIDEEM1

Ron of the transistor gate is  $\approx 10k\Omega$ .

Figure 5

### VIDEEM2 / 22kHz

Ron of the transistor gate is  $\approx 10k\Omega$ .

Figure 6

### VID IN

Figure 7

## PIN INTERNAL CIRCUITRY (continued)

**PK OUT R, PK OUT L**

Figure 8

**FC L, FC R**

Ivar is controlled by the peak det audio level max.  $\pm 15\mu\text{A}$  (1V<sub>PP</sub> audio).

Figure 9

**VOL OUT R, VOL OUT L**

Audio output with volume and scart driver with +12dB of gain for up to 2V<sub>RMS</sub>. The opamp has a push-pull output stage.

Figure 10

**S2 OUT L, S2 OUT R, S3 OUT L, S3 OUT R**

Same as above but with gain fixed at +6dB.

Figure 11

**S2 RTN L, S2 RTN R, S3 RTN L, S3 RTN R**

4.8V bias voltage is the same as the bias level on the audio outputs.

Figure 12

**FM IN**

The other input for each channel is internally biased in the same way via 10kΩ to the 2.4V V<sub>REF</sub>.

Figure 13

**I<sub>REF</sub>**

The optimum value if I<sub>REF</sub> is 50μA  $\pm 2\%$  so an external resistor of 47.5kΩ  $\pm 1\%$  is required.

Figure 14

**I/O / 22kHz**

The input is TTL compatible. The output is tri-stateable.

Figure 15

**SCL**

This is the input to a Schmitt input buffer made with a CMOS amplifier.

Figure 16

**PIN INTERNAL CIRCUITRY (continued)****SDA**

Input same as above.

Output pull down only : relies on external resistor for pull-up.

**Figure 17****J17 L, J17 R, U75 L, U75 R**

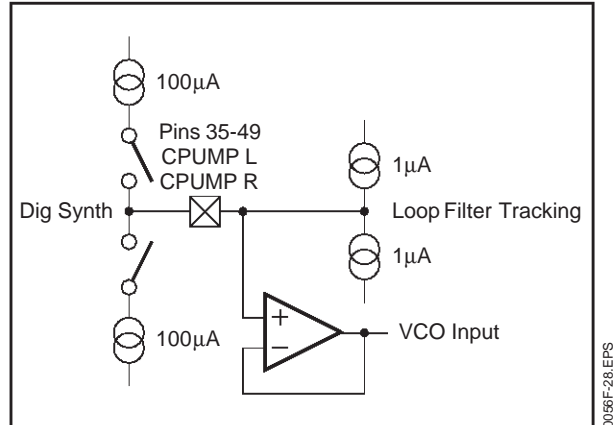

I1 - I2 = 2 x audio / 18kΩ. eg 1V<sub>PP</sub> audio : ±55μA.  
The are internal switches to match the audio level of the different standards.

**Figure 18****HA**

Input with CMOS levels.

**Figure 19****XTL****Figure 20****CPUMP L, CPUMP R**

An offset on the PLL loop filter will cause an offset in the two 1μA currents that will prevent the PLL from drifting-off frequency.

**Figure 21****DET L, DET R**

I2 - I1 = f (phase error).

**Figure 22****AMPLK L, AMPLK R, AGC L, AGC R**

I2 and I1 from the amplitude detecting mixer.

**Figure 23**

## PIN INTERNAL CIRCUITRY (continued)

 **$V_{REF}$** 

The 400 $\mu$ A source is off during stand-by mode.

Figure 24

0056F-31.EPS

**LEVEL L, LEVEL R**

Figure 25

0056F-32.EPS

**PK IN L, PK IN R**

Figure 26

0056F-33.EPS

**V 12V**

Doubled bonded (two bond wires and two pads for one package pin) :

- One pad is connected to all of the 12V ESD and video guard rings.
- The second pad is connected to power up the video block.

**V GND**

Doubled bonded :

- One pad is connected to power-up all of the video mux and I/O.
- The second pad is only as a low noise GND for the video input.

 **$V_{DD}$  5V, GND 5V**

Connected to XTL oscillator and the bulk of the CMOS logic and 5V ESD.

**A GND**

Doubled bonded :

- One pad connected to the left VCO, dividers, mixers and guard ring. the guard connection is star connected directly to the pad.
- The second pad is connected to both AGC amps and the deemphasis amplifiers, frequency synthesis and FM deviation selection circuit for both channels.

**A 12V**

Doubled bonded :

- One pad connected to the ESD and guard ring.
- The second pad is connected to the main power for all of the audio parts.

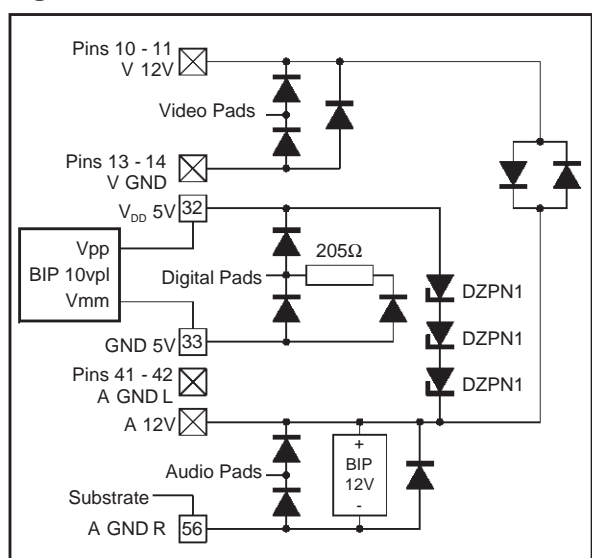

**A GND R**

Doubled bonded :

- One pad connected to the right VCO, dividers, mixers and guard ring. The guard connection is star connected directly to the pad.
- The second pad is connected to the bias block, audio noise reduction, volume, mux and ESD.

A third bond wire on this pin is connected directly to the die pad (substrate).

Figure 27

0056F-34.EPS

**I<sup>2</sup>C PROTOCOL****1) WRITING** to the chip**S**-Start Condition**P**-Stop Condition**CHIP ADDR** - 7 bits. Programmable 06H or 46H (STV0056AF only) with Pin HA.**W**-Write/Read bit is the 8th bit of the chip address.**A**-ACKNOWLEDGE after receiving 8 bits of data/address.**REG ADDR** Address of register to be written to, 8 bits of which bits 3, 4, 5, 6 & 7 are 'X' or don't care ie *only the first 3 bits are used*.**DATA** 8 bits of data being written to the register. All 8 bits must be written to at the same time.**REG ADDR/A/DATA/A** can be repeated, the write process can continue until terminated with a STOP condition. If the **REG ADDR** is higher than 07 then IIC PROTOCOL will still be met (ie an **A** generated).**Example :**

S	06	W	A	00	A	55	A	01	A	8F	//	A	P
---	----	---	---	----	---	----	---	----	---	----	----	---	---

**2) READING** from the chip

When reading, there is an auto-increment feature. This means any read command always starts by reading Reg 8 and will continue to read the following registers in order after each acknowledge or until there is no acknowledge or a stop. This function is cyclic that is it will read the same set of registers without re-addressing the chip. There are two modes of operation as set by writing to bit 7 of register 0. Read 3 registers in a cyclic fashion or all 5 registers in a cyclic fashion. Note only the last 5 of the 11 registers can be read.

Reg0 bit 7 = L  $\Rightarrow$  Start / chip add / R / A / Reg 8 / A / Reg 9 / A / Reg 0A / A / Reg 8 / A / Reg 9 / A / Reg 0A / ... / P /

Reg0 bit 7 = H  $\Rightarrow$  Start / chip add / R / A / Reg 8 / A / Reg 9 / A / Reg 0A / A / Reg 7 / A / Reg 6 / A / Reg 8 / A / Reg 9 / A / Reg 0A / A / Reg 7 / A / Reg 6 / ... / P /

**CONTROL REGISTERS****Reg 0 write only**Bit (default 00<sub>HEX</sub>)

- 0 L Select 5 bits audio volume control 00H = MUTE
- 1 L Select 5 bits audio volume control 01H = -26.75dB
- 2 L Select 5 bits audio volume control :: : :
- 3 L Select 5 bits audio volume control 1.25dB steps up to
- 4 L Select 5 bits audio volume control 1FH = +12dB
- 5 L Audio mux switch K4 - ANRS I/P select (L = PLL)
- 6 L Audio mux switch K3 - ANRS select (L = no ANRS, H = ANRS)
- 7 L L = read 3 registers, H = read 5 registers

**Reg 1 write only**Bit (default 00<sub>HEX</sub>)

- 0 L Select video gain bits
- 1 L Select video gain bits 00H = 0dB
- 2 L Select video gain bits 01H = +0.202dB
- 3 L Select video gain bits 02H = +0.404dB
- 4 L Select video gain bits n = + 0.202 dB \* n
- 5 L Select video gain bits 3FH = + 12.73 dB
- 6 L Selected video invert (H = inverted, L = non inverted)
- 7 L Video deemphasis 1 / Video deemphasis 2 (L : V<sub>ID</sub> De-em 1)

**CONTROL REGISTERS** (continued)**Reg 2    write only**Bit (default F7<sub>HEX</sub>)

- 0 H Select video source for scart 1 O/P
- 1 H Select video source for scart 1 O/P
- 2 H Select video source for scart 1 O/P
- 3 L Select 4.000MHz or 8.000MHz clock speed (L = 8MHz)
- 4 H Select audio source for volume output (Switch K1)
- 5 H Select audio source for volume output (Switch K1)
- 6 H Select Left/Right/Stereo for volume output
- 7 H Select Left/Right/Stereo for volume output

**Reg 3    write only**Bit (default F7<sub>HEX</sub>)

- 0 H Select video source for scart 2 O/P
- 1 H Select video source for scart 2 O/P
- 2 H Select video source for scart 2 O/P
- 3 L Video deemphasis 2 / 22kHz (H : 22kHz)
- 4 H Select audio source for Scart 2 output (Switch K5)
- 5 H Select audio source for Scart 2 output (Switch K5)
- 6 H Audio deemphasis select (Switch K2)
- 7 H Audio deemphasis select (Switch K2)

**Reg 4    write only**Bit (default BF<sub>HEX</sub>)

- 0 H Select source for video decoder O/P
- 1 H Select source for video decoder O/P
- 2 H Select source for video decoder O/P
- 3 H Stand-by or low power mode (H = low power)
- 4 H Select audio source for Scart 3 output (Switch K6)
- 5 H Select audio source for Scart 3 output (Switch K6)
- 6 L Black level adjust on Scart 3 video
- 7 H Black level adjust on Scart 3 video

**Reg 5    write only**Bit (default B5<sub>HEX</sub>)

- 0 H FM deviation selection -- default value for 50kHz modulation
- 1 L FM deviation selection
- 2 H FM deviation selection
- 3 L FM deviation selection
- 4 H FM deviation selection
- 5 H FM deviation selection (L = double the FM deviation)
- 6 L Select 22kHz for I/O (Pin 29 / STV0056AF)
- 7 H Select TP50a (H) or I/O (Pin 29 / STV0056AF). TP50a for test only.

**Reg 6    write/read**Bit (default 86<sub>HEX</sub>)

- 0 L Status of I/O
- 1 H Select data direction of I/O 1 (H = output)
- 2 H Select frequency synthesizer 1 OFF/ON (L = OFF)
- 3 L Select frequency synthesizer 2 OFF/ON (L = OFF)
- 4 L Select RF source (L = OFF) to FM det 1
- 5 L Select RF source (L = OFF) to FM det 2
- 6 L Select frequency for PLL synthesizer - LSB (bit 0) of 10-bit value
- 7 H Select frequency for PLL synthesizer - bit 1 of 10-bit value

**CONTROL REGISTERS** (continued)**Reg 7    write/read**Bit (default AF<sub>HEX</sub>)

- |   |   |  |
|---|---|--|
| 0 | H | Select frequency for PLL synthesizer - bit 2 of 10-bit value                 |

| 7 | Read frequency of watchdog 2 - bit 9, MSB (10th bit) of 10-bit |

**CONTROL REGISTERS** (continued)**Video Mux Truth Tables**

Register 2 <0:2> ⇒ Scart 1 video output control

Register 3 <0:2> ⇒ Scart 2 video output control

Register 4 <0:2> ⇒ Scart 3 decoder output control

The truth table for the three scart outputs are the same.

Register 2/3/4			Video Output
Bit<2>	Bit<1>	Bit<0>	
0	0	0	Baseband video
0	0	1	De-emphasized video
0	1	0	Normal video
0	1	1	Scart 3 return
1	0	0	Scart 2 return
1	0	1	Scart 1 return
1	1	0	Nothing selected
1	1	1	High Z or low power (default)

Register 4		Black Level Adjust on Scart 3
Bit <7>	Bit <6>	
0	0	-150mV
1	0	0 (default)
0	1	+150mV
1	1	+300mV

**Audio Mux Truth Tables**

Register 2		Switch K1/Audio Source Selection for Volume Output
Bit <5>	Bit <4>	
0	0	A Volume Output
1	0	C Audio deemphasis (K2 switch O/P)
0	1	B Scart 2 return
1	1	- Scart 3 return
		- High Z or low power (default)

Register 3		Switch K2/Audio Deemphasis
Bit <7>	Bit <6>	
0	0	A Audio Deemphasis
1	0	C No deemphasis
0	1	B J17
1	1	B 50µs
		B 75µs (default)

Register 0		Switch K3 & K4
Bit <6>	Bit <5>	
0	X	A ANRS I/O Select
1	X	B Noise reduction OFF
X	0	A Noise reduction ON (default)
X	1	B I/P = PLL
		B I/P = Scart 3 return

Register 3		Switch K5/Audio Source Selection for Scart 2
Bit <5>	Bit <4>	
0	0	C Aux Audio Output
1	0	A PLL output
0	1	B Scart 3 return
1	1	- Audio deemphasis (K2 switch O/P)
		- High Z or low power state (default)

Register 4		Switch K6/Audio Source Selection for Scart 3
Bit <5>	Bit <4>	
0	0	A Audio Decoder Output
1	0	C PLL output
0	1	B Audio deemphasis (K2 switch O/P)
1	1	- Scart 2 return
		- High Z or low power state (default)

**CONTROL REGISTERS** (continued)

Register 2		Left / Right / Stereo on Volume Output
Bit <7>	Bit <6>	
0	0	Mono left / channel 1
1	0	Mono right / channel 2
1	1	Stereo left & right (default)

**Register 5 : FM Deviation Selection**

					Selected Nominal Carrier Modulation	
4	3	2	1	0	Bit 5 = 0	Bit 5 = 1
0	0	0	0	0	Do not use	cal : do not use = 0.3373V offset on VCO
0	0	0	0	1	Do not use	cal : do not use = 0.3053V offset on VCO
0	0	0	1	0	Do not use	cal : do not use = 0.2763V offset on VCO
<b>0</b>	<b>0</b>	<b>0</b>	<b>1</b>	<b>1</b>	Cal. set. (2V)	<b>calibration setting (1V offset on VCO)</b>
0	0	1	0	0	592kHz	296kHz modulation
0	0	1	0	1	534kHz	267kHz modulation
0	0	1	1	0	484kHz	242kHz
0	0	1	1	1	436kHz	218kHz
0	1	0	0	0	396kHz	198kHz
0	1	0	0	1	358kHz	179kHz
0	1	0	1	0	322kHz	161kHz
0	1	0	1	1	292kHz	146kHz
0	1	1	0	0	266kHz	133kHz
0	1	1	0	1	240kHz	120kHz
0	1	1	1	0	218kHz	109kHz
0	1	1	1	1	196kHz	98.3kHz
1	0	0	0	0	179kHz	89.7kHz
1	0	0	0	1	161kHz	80.9kHz
1	0	0	1	0	146kHz	73.1kHz
1	0	0	1	1	122kHz	66.0kHz
1	0	1	0	0	120kHz	60.0kHz
<b>1</b>	<b>0</b>	<b>1</b>	<b>0</b>	<b>1</b>	109kHz	<b>54.4kHz = default power up state</b>
1	0	1	1	0	98kHz	49.1kHz
1	0	1	1	1	89kHz	44.3kHz
1	1	0	0	0	78kHz	39.8kHz
1	1	0	0	1	71kHz	35.9kHz
1	1	0	1	0	65kHz	32.4kHz
1	1	0	1	1	58kHz	29.1kHz
1	1	1	0	0	53kHz	26.7kHz
1	1	1	0	1	48.6kHz	24.3kHz
1	1	1	1	0	43.8kHz	21.9kHz
1	1	1	1	1	39.6kHz	19.7kHz

**Example :** Default power up state 54.4kHz  $\Rightarrow$   $\pm 54.4$ kHz.

Register 1 Bit <7>	Register 3 Bit <3>	Video Deemphasis/22kHz
0	0	Deemphasis 1 (default)
0	1	Deemphasis 1 + 22kHz
1	0	Deemphasis 2
1	1	Deemphasis 2

Register 5		Digital I/O (STV0056AF pin 29)
Bit <7>	Bit <6>	
0	0	I/O (refer to Register 6 Bit <0> Bit <1>)
0	1	22kHz
1	0	Do not use (for test only) (default)
1	1	22kHz

## FM DEMODULATION SOFTWARE ROUTINE

With the STV0056AF circuit, for each channel, three steps are required to achieve a FM demodulation :

- 1<sup>st</sup> step : To set the demodulation parameters :
  - FM deviation selection,
  - Subcarrier frequency selection.
- 2<sup>nd</sup> step : To implement a waiting loop to check the actual VCO frequency.
- 3<sup>rd</sup> step : To close the demodulation phase locked loop (PLL).

Referring to the FM demodulation block diagram (page 12), the frequency synthesis block is common to both channels (left and right) ; consequently

two complete sequences have to be done one after the other when demodulating stereo pairs.

### Detailed Description

Conventions :

- R = Stands for Register
- B = Stands for Bit

**Example :** R05 B2 = Register 05, Bit 2

For clarity, the explanations are based on the following example : stereo pair 7.02MHz/L 7.20MHz/R, deviation  $\pm 50$ kHz max.

### 1st STEP (LEFT) : SETTING THE DEMODULATION PARAMETERS

**A.** The FM deviation is selected by loading R5 with the appropriate value. (see R5 truth table).

NB : Very wide deviations (up to  $\pm 592$ kHz) can be accommodated when R5 B5 is low.

Corresponding bandwidth can be calculated as follows :

$$Bw \approx 2 \text{ (FM deviation + audio bandwidth)}$$

$$Bw \approx 2 \text{ (value given in table + audio bandwidth)}$$

In the example :

R5Bits	7	6	5	4	3	2	1	0
	X	X	1	1	0	1	1	0

**B.** The subcarrier frequency is selected by launching a frequency synthesis (the VCO is driven to the wanted frequency). This operation requires two actions :

- To connect the VCO to the frequency synthesis loop. Referring to the FM block diagram (page 12):
  - SW4 closed  $\Rightarrow$  R6 B2 = H
  - SW3 to bias  $\Rightarrow$  R6 B4 = L
  - SW2 to bias  $\Rightarrow$  R6 B3 = L
  - SW1 opened  $\Rightarrow$  R6 B5 = L

- To load R7 and R6 B6 B7 with the value corresponding to the left channel frequency. This 10 bits value is calculated as follows :

$$\text{Subcarrier frequency} = \text{coded value} \times 10\text{kHz}$$

(10kHz is the minimum step of the frequency synthesis function)

Considering that the tuning range is comprised between 5 to 10MHz, the coded value is a number between 500 and 1000 ( $2^{10} = 1024$ ) then 10 bits are required.

**Example :**

$$7.02\text{MHz} = 702 \times 10\text{kHz}$$

$$702 \Rightarrow 1010\ 1111\ 10 \Rightarrow \text{AF} + 10$$

R7 is loaded with AF and R6 B6 : L, R6 B7 : H.

The Table 1 gives the setting for the most common subcarrier frequencies.

**Table 1 : Frequency Synthesis Register Setting for the Most Common Subcarrier Frequencies**

Subcarrier Frequency (MHz)	Register 7 (Hex)	Register 6	
		Bit 7	Bit 6
5.58	8B	1	0
5.76	90	0	0
5.8	91	0	0
5.94	94	1	0
6.2	9B	0	0
6.3	9D	1	0
6.4	A0	0	0
6.48	A2	0	0
6.5	A2	1	0
6.6	A5	0	0
6.65	A6	0	1
6.8	AA	0	0
6.85	AB	0	1
7.02	AF	1	0

**FM DEMODULATION SOFTWARE ROUTINE** (continued)**2<sup>nd</sup> STEP (LEFT) :****VCO FREQUENCY CHECKING (VCO)**

This second step is actually a waiting loop in which the actual running frequency of the VCO is measured.

To exit of this loop is allowed when :  $\text{Subcarrier Frequency} - 10\text{kHz} \leq \text{Measured Frequency} \leq \text{Subcarrier Frequency} + 10\text{kHz}$  ( $\pm 10\text{kHz}$  is the maximum dispersion of the frequency synthesis function).

In practice, R8 B2 B3 and R9 are read and compared to the value loaded in R6 B6 B7 and R7  $\pm 1$  bit.

**Note :**

The duration of this step depends on how large is frequency difference between the start frequency and the targeted frequency. Typically :

- the rate of change of the VCO frequency is about  $3.75\text{MHz/s}$  ( $C_{\text{pump}} = 10\mu\text{F}$ )
- In addition to this settling time, 100ms must be added to take into account the sampling period of the watchdog.

**3<sup>rd</sup> STEP (LEFT)**

The FM demodulation can be started by connecting the VCO to the phase locked loop (PLL).

In practice :

- SW3 closed  $\Rightarrow$  R6 B4 = H
- SW4 opened  $\Rightarrow$  R6 B2 = L

After this sequence of 3 steps for left channel, a similar sequence is needed for the right channel.

**Note :**

In the sequence for the right, there is no need to again select the FM deviation (once is enough for the pair).

**General Remark**

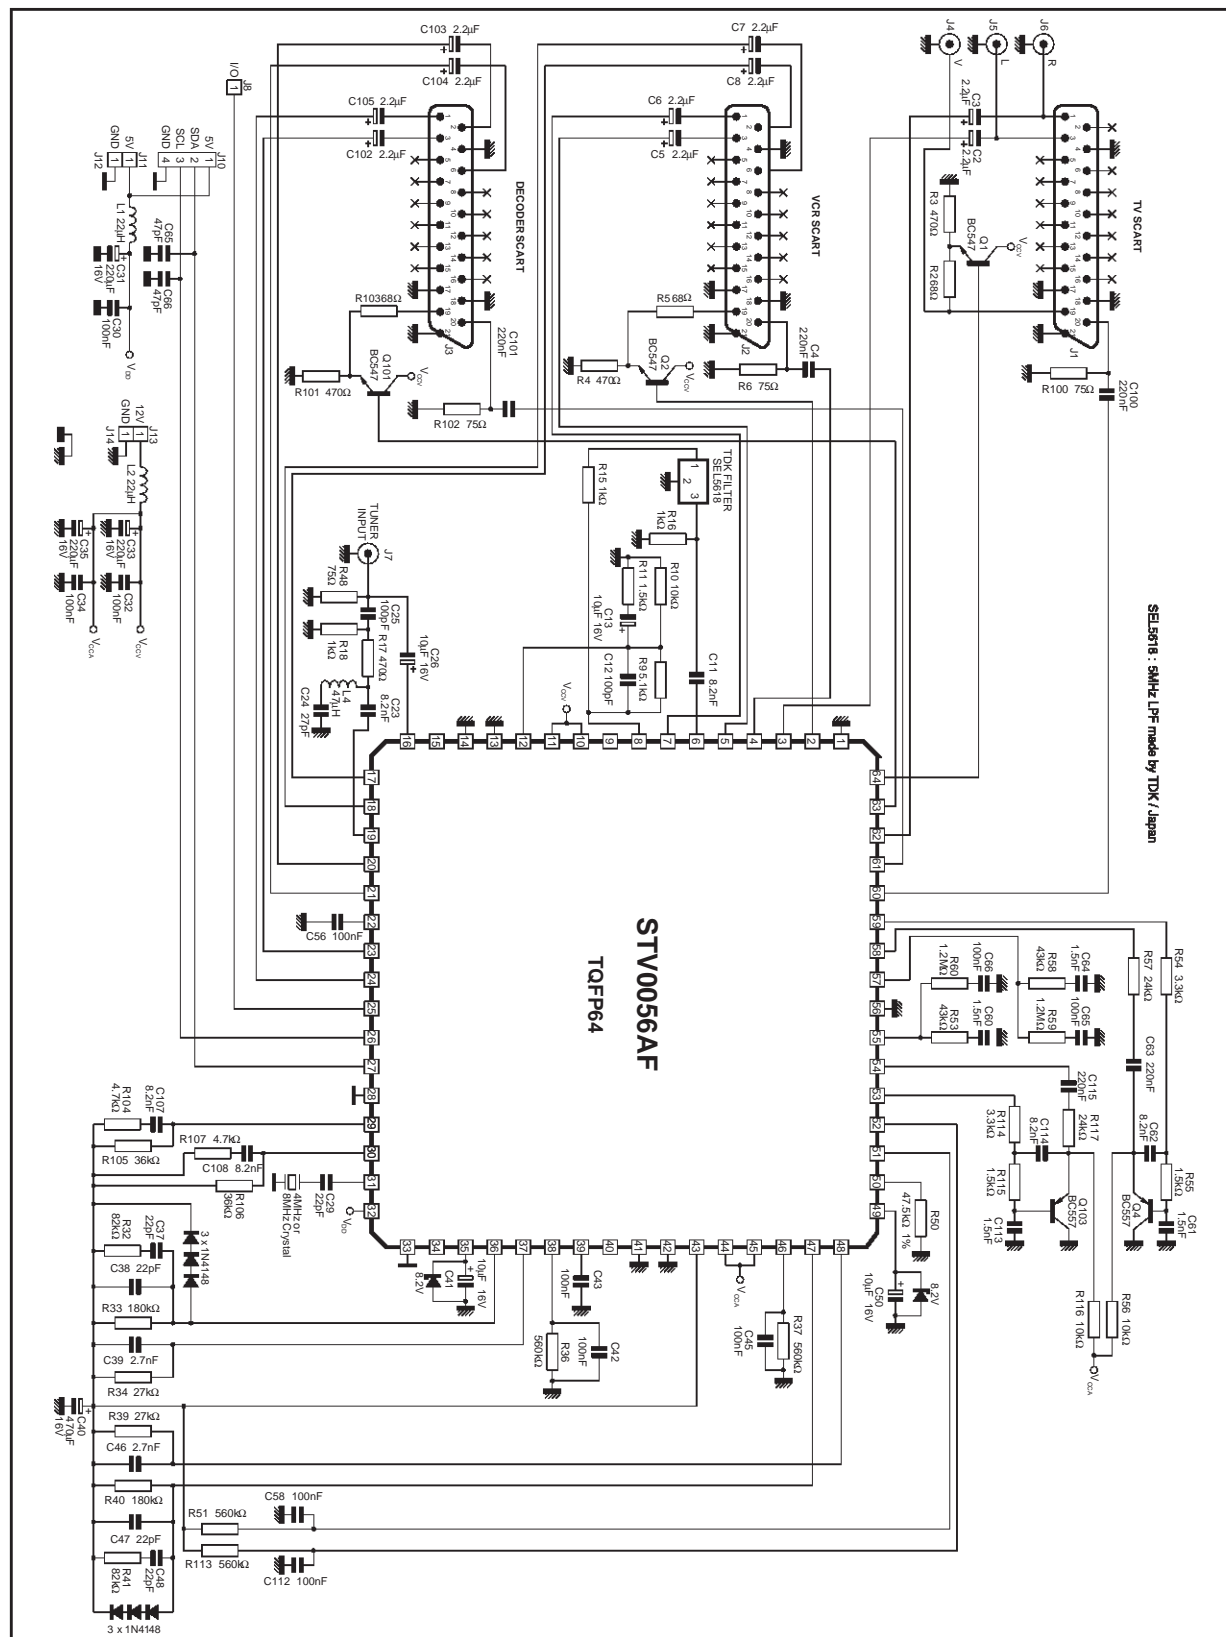

Before to enable the demodulated signal to the audio output, it is recommended to keep the muting and to check whether a subcarrier is present at the wanted frequency. Such an information is available in R8 B0 and R8 B4 which can be read.

Two different strategies can be adopted when enabling the output :

- Either both left and right demodulated signals are simultaneously authorized when both channel are ready.
- Or while the right channel sequence is running, the already ready left signal is sent to the left and right outputs and the real stereo sound L/R is output when both channels are ready. This second option gives sound a few hundreds of ms before the first one.

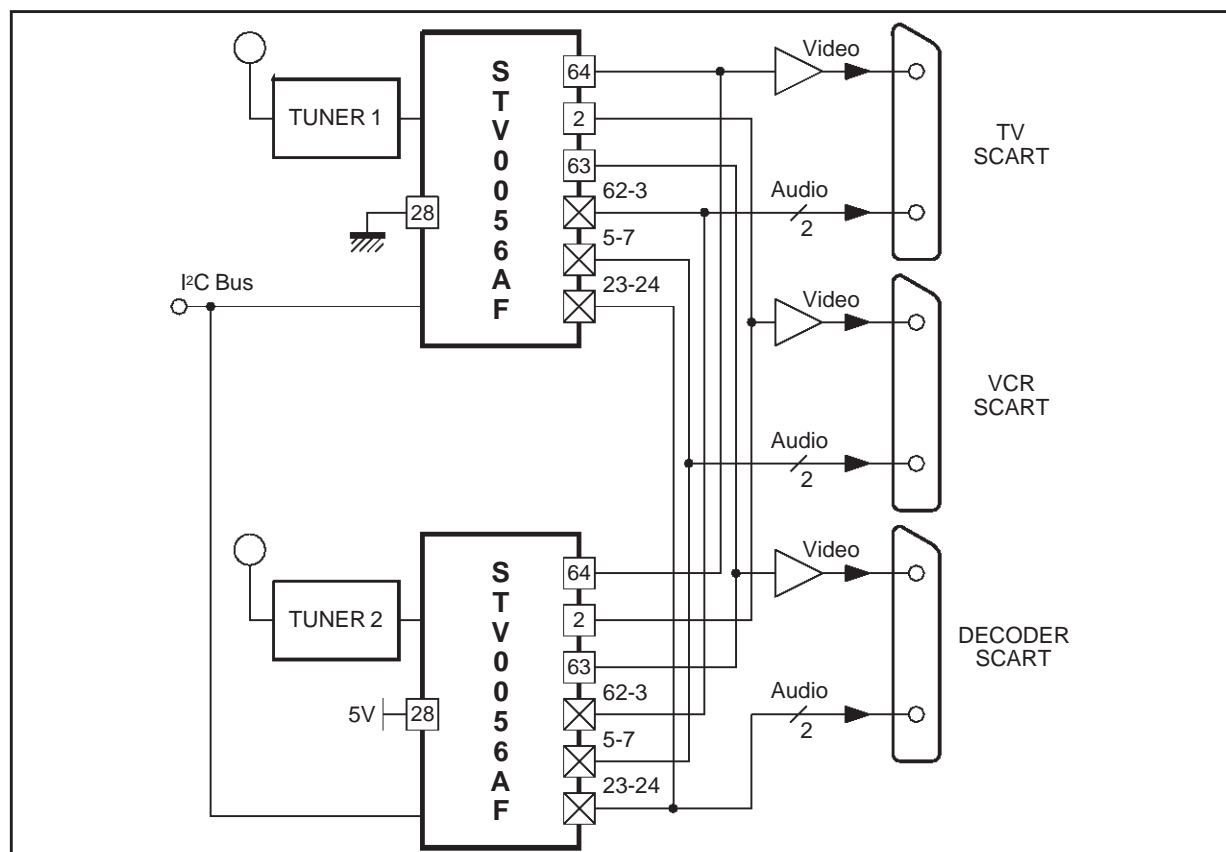

### TYPICAL APPLICATION (3 SCARTS, PAL/SECAM Europe Appllication)

## TWIN TUNER APPLICATION

Easy parallel connection of the outputs to the scarts without any additional switching hardware.

This configuration is possible due to the high impedance mode that can be selected for each audio and video outputs.
