- Very low operating current

## FEATURES

- High-speed operation
- 1500 Vrms I/O isolation
- Current-limit protection
- High surge capability
- Linear, ac/dc operation
- Clean, bounce-free switching
- Extremely low power consumption
- High-reliability monolithic receptor
- Surface-mountable

## APPLICATIONS

- PCMCIA Type 2 cards
- Battery powered switch applications
- General telecom switching
- Telephone line interface
- On/off hook
- Ring relay
- Ground start
- Programmable controllers
- Instrumentation

## DESCRIPTION

The LH1525 relay is an SPST normally open switche (1 Form A and Dual 1 Form A respectively) in small-outline packages (SOP). They require a minimal amount of LED drive current to operate, making them ideal for battery powered and power consumption sensitive applications.

The relays are constructed using a GaAIAs LED for actuation control and an integrated monolithic die for the switch output. The die, fabricated in a high-voltage dielectrically isolated BCDMOS technology, is comprised of a photodiode array, switchcontrol circuitry, and MOSFET switches. In addition, the relays employ current-limiting circuitry enabling it to pass FCC 68.302 and other regulatory surge requirements when overvoltage protection is provided.
The LH1525 (1 Form A) is packaged in an 8-pin, plastic SOP (LH1525ACD). Available in sticks or on tape and reel.

Figure 1. LH1525ACD Functional/Pin Diagram

## Functional Description

Figure 3 shows the switch characteristics of the relays. The relay exhibits an ON-resistance that is exceptionally linear through the origin and up to the knee current (lk). Beyond lk, the incremental resistance decreases, minimizing internal power dissipation. Overload currents are clamped at ILMT by the internal current-limit circuitry. The current-limiting circuitry exhibits a negative temperature coefficient, thereby reducing the current-limit value when relay temperature is increased. An extended clamp condition, which increases relay temperature, decreases the current-limit value, resulting in a current foldback characteristic. When the overload is removed, the relay resumes its normal ONresistance characteristic.

Figure 3. Typical ac/dc ON Characteristics

## Absolute Maximum Ratings At $25^{\circ} \mathrm{C}$

Stresses in excess of the Absolute Maximum Ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in

In a 1 Form A relay, to turn the relay on, forward current is applied to the LED. The amount of current applied determines the amount of light produced for the photodiode array. This photodiode array develops a drivevoltage for the MOSFET switch outputs. For hightemperature or high-load current operations, more LED current is required.

## Thermal Considerations

To minimize thermal resistance, pins 6 and 7 of the LH1525ACD are formed into a tab. This tab should be soldered to a printed circuit board land pattern of equal or greater size. Do Not run metal underneath the device or the input-to-output isolation could be jeopardized.
excess of those given in the operational sections of the data sheet. Exposure to Absolute Maximum Ratings for extended periods can adversely affect the device reliability.

## APPLICATIONS

## Input Control

The LH1525 low turn-on current SSR has highly sensitive photo-detection circuits that will detect even the most minute currents flowing through the LED. Leakage current must be considered when designing a circuit to turn on and off these relays.

Figure 23 shows a typical logic circuit for providing LED drive current. R1 is the input resistor that limits the amount of current flowing through the LED. For 5 V operation, a $2700 \Omega$ resistor will limit the drive current to about 1.4 mA . Where high-speed actuation is desireable, use a lower value resistor for R1. An additional RC peaking circuit is not required with the LH1525 relay.
$R 2$ is an optional pull-up resistor which pulls the logic level high ouput $\left(\mathrm{V}_{\mathrm{OH}}\right)$ up toward the $\mathrm{V}_{\mathrm{S}}$ potential. The pull-up resistance is set at a high value to minimize the overall current drawn from the $\mathrm{V}_{\mathrm{S}}$. The primary purpose of this resistor is to keep the differential voltage across the LED below its turn-on threshold. LED dropout voltage is graphed vs. temperature in the Typical Performance Characteristics section. When the logic gate is high, leakage current will flow through $R_{2}$. $R_{2}$ will draw up to $8 \mu \mathrm{~A}$ before developing a voltage potential which might possibly turn on the LED.

Many applications will operate satisfactorily without a pull-up resistor. In the logic circuit in Figure 1 the only path for current to flow is back into the logic gate. Logic leakage is usually negligible. Each application should be evaluated, however, over the full operating temperature range to make sure that leakage current through the input control LED is kept to a value less than the minimum LED forward current for switch turn-off specification.

## DESCRIPTION

The LH1547 is a SPST normally open unidirectional relay that can switch ac and dc signals. The relay is constructed using a GaAIAs LED for actuation control and an integrated monolithic die for the switch output. The die, fabricated in a high-voltage dielectrically isolated BICMOS technology, is comprised of a photodiode array, switch control circuitry, and a DMOS switch.

The LH1547 relay is packaged in a 6-pin DIP (LH1547AT1) or in a surface-mount gull wing (LH1547AAB1).

Figure 1. Functional Diagram (LH1547)

Absolute Maximum Ratings $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$
Stresses in excess of the Absolute Maximum Ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in
excess of those given in the operational sections of the data sheet. Exposure to Absolute Maximum Ratings for extended periods can adversely affect the device reliability.

## FEATURES

- 1500 Vrms input/output isolation
- High-surge capability
- Low ON-resistance
- Clean, bounce-free switching
- dv/dt typically better than 500 V/ $\mu \mathrm{s}$
- Low power consumption
- Monolithic IC reliability

## APPLICATIONS

- Telecom switching
- Transducer driver
- High-voltage testers
- Industrial controls
- Triac predriver
- Isolation switching

## DESCRIPTION

The LH1191 High-Voltage, Solid State Relay is a single pole, normally open switch (1 Form A) that can replace electromechanical relays in many applications. The relay features logic-level input control of isolated high-voltage switch outputs. The output is rated at 280 V and can handle loads up to 120 mA . The relay can switch both ac and dc loads and is ideal for audio frequency or dc applications. Typical ON-resistance at 25 mA is $25 \Omega$.

The LH1191 relay consists of a GaAIAs LED that optically couples control signals to a monolithic integrated circuit. Optical coupling provides 1500 Vrms of input/output isolation. The integrated circuit is a dielectrically isolated, high-voltage die comprised of photodiode arrays, switch control circuitry, and high-voltage DMOS transistor switches.

In operation, the device is exceptionally linear up to 55 mA . Beyond 55 mA , the incremental resistance decreases, thereby minimizing internal power dissipation. Overload currents are clamped at 210 mA by internal current limiting. An extended clamp condition, which increases relay temperature, results in a reduction in clamp current, thereby further reducing internal power dissipation and preserving the relay's integrity. The relay is packaged in a 6-pin, plastic DIP (LH1191AT1) or in a 6-pin, surface-mount, gull-wing configuration (LH1191AAB1).

Absolute Maximum Ratings $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$
Stresses exceeding the values listed under Absolute Maximum Ratings can cause permanent damage to the device. This is an absolute stress rating only. Functional operation of the device at these or any other conditions
in excess of those indicated in the operational sections of this data sheet is not implied. Exposure to maximumrating conditions for extended periods ot time can adversely affect the device reliability.

## DESCRIPTION

The LH1085 High-Voltage, Solid State Relay is a single pole, normally open switch (1 Form A) that can replace electromechanical relays in many applications. The relay features logic-level input control of isolated high-voltage switch outputs. The output is rated at 350 V and can handle loads up to 135 mA . The relay can switch both ac and dc loads and is ideal for audio frequency or dc applications. Typical ON-resistance at 25 mA is $30 \Omega$.

The LH1085 relay consists of a GaAIAs LED that optically couples control signals to a monolithic integrated circuit. Optical coupling provides 1500 Vrms of input/output isolation. The integrated circuit is a dielectrically isolated, high-voltage die comprised of photodiode arrays, switch control circuitry, and high-voltage DMOS transistor switches.

In operation, the device is exceptionally linear up to 45 mA . Beyond 45 mA , the incremental resistance decreases, thereby minimizing internal power dissipation. Overload currents are clamped at 300 mA by internal current limiting. An extended clamp condition, which increases relay temperature, results in a reduction in clamp current, thereby further reducing internal power dissipation and preserving the relay's integrity. The relay is packaged in a 6-pin, plastic DIP (LH1085AT1) or in a 6-pin, surface-mount, gull-wing configuration (LH1085AAB1).

Absolute Maximum Ratings $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$
