

### White led power supply for large display backlight

#### **General Features**

- Inductor switches boost controller
- PFM mode control
- High efficiency over wide range of input voltage from 3.0V to 5.5V
- Overvoltage protection with automatic restart
- Adjustable peak current limit
- Enable pin with possibility of PWM dimming control
- Low shutdown current <1uA</p>
- Small external component
- Good load and line regulation
- QFN 3mm x 3mm x 1mm 8 leads

#### **Application**

- White Led supply for LCD backlight
- Mobile phone
- PDA and organizers
- Any handsets powered form 3.0V to 5.5V

### **Description**

STLD40D is a boost converter that operates from 3.0V to 5.5V and can provide an output voltage as

high as 37V and can drive up to 10 white LEDs in series. The converter is a PFM (pulse frequency modulation) inductor switches and can work in discontinuous (DCM) mode operation. A minimum OFF time of the embedded boost switch  $T_{\rm SW}$  is fixed internally and allows limiting the switching frequency. The output current capability is 20mA with an output voltage of 37V.

The regulation is done by sensing the led current through the resistor  $R_{\text{LED}}$ .

The device can be turned ON/OFF through the logic enable signal pin EN. By applying a low frequency PWM signal the LEDs can be dimmed.

The maximum peak inductor current can be programmed by connected a resistor  $R_{\text{SET}}$  to the pin  $R_{\text{SET}}$ .

Functional description STLD40D

### 5 Functional description

#### 5.1 Boost controller

The STLD40D is a Boost converter operating in PFM (pulsed frequency modulation) mode.

The converter monitors the LED current through the resistor  $R_{LED}$  and when the feedback voltage falls below the reference voltage REF2, the boost switch  $T_{SW}$  turns ON and the current ramps up. The inductor current is measured by sensing the temperature compensated drain voltage of the boost MOSFET. The boost turns off when its drain voltage reaches the internally reference REF1, the main switch remains off until the minimum off time (250ns typical) has passed and the feedback voltage is below the reference again. A maximum ON time of 4 $\mu$ s typical prevents the switch  $T_{SW}$  to stay ON during a too long period of time.

### 5.2 Adjustable peak inductor current limit

The peak inductor current is monitored by sensing the drain voltage of the switch TSW. Since it exceeds the temperature compensated and supply voltage compensated reference REF1, the RS Flip flop is reset and  $T_{SW}$  is turned OFF. By connecting a resistance to the pin  $R_{SET}$  the peak current limit can be adjusted. from 200mA to 1A. When  $R_{SET}$  resistor value is about  $12k\Omega$  is connected directly to GND, the default value is 1A.

#### 5.3 Enable

The ENABLE pin is a high logic input signal and allows turning on/off the controller without cutting the input voltage from the boost regulator circuit. The pin ENABLE can be used to dim the LED by applying a low frequency PWM signal.

#### 5.4 **OVP**

If the regulation loop is cut, there is no signal at the feedback pin, the PFM controller will then continue to switch without control and generate an output voltage at the SW, and  $V_O$  pin exceeding the breakdown value  $V_{BSW}$ , and  $V_{BO}$ .

The Over Voltage Protection (OVP) senses the voltage at the  $V_O$  pin. When the voltage exceed 38V Min the controller is automatically turned OFF.

A hysteresis control allows the device restarting automatically since the output voltage drops down of 1.5V.

The external components proposal should be considered as a design reference guide. The performances mentioned in the electrical characteristics table are not guaranteed for all the possible electrical parameters of the components included in this list. On an other hand the operation of STLD40D is not limited with the use of components included in this list

Package mechanical data STLD40D

## 7 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect. The category of second Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
