

5.0 or 3.0V, 512 bit (64 bit x8) Serial RTC (SPI) SRAM and NVRAM Supervisor

FEATURES SUMMARY

- 5.0 OR 3.0V OPERATING VOLTAGE
- SERIAL PERIPHERAL INTERFACE (SPI)
- NVRAM SUPERVISOR FOR EXTERNAL LPSRAM
- 2.5 TO 5.5V OSCILLATOR OPERATING VOLTAGE
- AUTOMATIC SWITCH-OVER AND DESELECT CIRCUITRY
- CHOICE OF POWER-FAIL DESELECT VOLTAGES:
 - M41ST95Y*: V_{CC} = 4.5 to 5.5V 4.20V $\leq V_{PFD} \leq$ 4.50V
 - $\quad M41ST95W: V_{CC} = 2.7 \text{ to } 3.6V \\ 2.55V \le V_{PFD} \le 24.70V$
- 1.25V REFERENCE (FOR PFI/PFO)
- COUNTERS FOR TENTHS/HUNDREDTHS OF SECONDS, SECONDS, MINUTES, HOURS, DAY, DATE, MONTH, YEAR, AND CENTURY
- 44 BYTES OF GENERAL PURPOSE RAM
- PROGRAMMABLE ALARM and INTERRUPT FUNCTION (VALID EVEN DURING BATTERY BACK-UP MODE)
- WATCHDOG TIMER
- MICROPROCESSOR POWER-ON RESET
- BATTERY LOW FLAG
- 32kHz FREQUENCY OUTPUT AVAILABLE IMMEDIATELY UPON POWER-ON (300mil SO28 MX PACKAGE ONLY)
- AUTOMATICALLY RECORDS TIME WHEN POWER-FAIL OCCURS
- ULTRA-LOW BATTERY SUPPLY CURRENT OF 550nA (MAX)
- PACKAGING INCLUDES A 28-LEAD SOIC and SNAPHAT[®] TOP (to be ordered separately)
- SOIC PACKAGE PROVIDES DIRECT CONNECTION FOR A SNAPHAT TOP WHICH CONTAINS THE BATTERY and CRYSTAL

Figure 2. 28-pin (300mil) SOIC Package

SUMMARY DESCRIPTION

The M41ST95Y/W Serial TIMEKEEPER[®] SRAM is a low power, 512-bit static CMOS SRAM organized as 64 words by 8 bits. A built-in 32,768Hz oscillator (external crystal controlled) and 8 bytes of the SRAM (see Table 4., page 16) are used for the clock/calendar function and are configured in binary coded decimal (BCD) format.

An additional 12 bytes of RAM provide status/control of Alarm, Watchdog and Square Wave functions. Addresses and data are transferred serially via a serial SPI interface. The built-in address register is incremented automatically after each WRITE or READ data byte. The M41ST95Y/W has a built-in power sense circuit which detects power failures and automatically switches to the battery supply when a power failure occurs. The energy needed to sustain the SRAM and clock operations can be supplied by a small lithium buttoncell supply when a power failure occurs. Functions available to the user include a non-volatile, timeof-day clock/calendar, Alarm interrupts, Watchdog Timer and programmable Square Wave output. Other features include a Power-On Reset as well as two additional debounced inputs (RSTIN1 and RSTIN2) which can also generate an output Reset (RST). The eight clock address locations contain the century, year, month, date, day, hour, minute, second and tenths/hundredths of a second in 24 hour BCD format. Corrections for 28, 29 (leap year - valid until year 2100), 30 and 31 day months are made automatically.

The M41ST95Y/W is supplied in a 28-lead SOIC SNAPHAT[®] (MH) package (which integrates both crystal and battery in a single SNAPHAT top), or a 28-pin, 300mil SOIC package (MX) which includes an embedded 32kHz crystal.

The 28-pin, 330mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery and crystal. The unique design allows the SNAPHAT battery/crystal package to be mounted on top of the SOIC package after the completion of the surface mount process.

Insertion of the SNAPHAT housing after reflow prevents potential battery and crystal damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is also keyed to prevent reverse insertion.

The SNAPHAT SOIC and battery/crystal packages are shipped separately in plastic anti-static tubes or in Tape & Reel form. For the 28-lead SO-IC, the battery/crystal package (e.g., SNAPHAT) part number is "M4TXX-BR12SH" (see Table 20., page 33).

Caution: Do not place the SNAPHAT battery/crystal top in conductive foam, as this will drain the lithium button-cell battery.

The 300mil, embedded crystal SOIC requires only a user-supplied battery to provide non-volatile operation.

Note: 1. CPOL (Clock Polarity) and CPHA (Clock Phase) are bits that may be set in the SPI Control Register of the MCU.

OPERATION

The M41ST95Y/W clock operates as a slave device on the SPI serial bus. Each memory device is accessed by a simple serial interface that is SPI bus compatible. The bus signals are SCL, SDI and SDO (see Table 1., page 5 and Figure 7., page 8). The device is selected when the Chip Enable input (\overline{E}) is held low. All instructions, addresses and data are shifted serially in and out of the chip. The most significant bit is presented first, with the data input (SDI) sampled on the first rising edge of the clock (SCL) after the Chip Enable (\overline{E}) goes low. The 64 bytes contained in the device can then be accessed sequentially in the following order:

- 1. Tenths/Hundredths of a Second Register
- 2. Seconds Register
- 3. Minutes Register
- 4. Century/Hours Register
- 5. Day Register
- Date Register
- 7. Month Register
- 8. Year Register
- 9. Control Register
- 10. Watchdog Register
- 11 16.Alarm Registers
- 17 19.Reserved
- 20. Square Wave Register
- 21 64.User RAM

The M41ST95Y/W clock continually monitors V_{CC} for an out-of tolerance condition. Should V_{CC} fall below V_{PFD} , the device terminates an access in progress and resets the device address counter. Inputs to the device will not be recognized at this time to prevent erroneous data from being written to the device from a an out-of-tolerance system. When V_{CC} falls below V_{SO} , the device automatically switches over to the battery and powers down into an ultra low current mode of operation to conserve battery life. As system power returns and V_{CC} rises above V_{SO} , the battery is disconnected,

and the power supply is switched to external V_{CC}. Write protection continues until V_{CC} reaches V_{PFD} (min) plus t_{REC} (min). For more information on Battery Storage Life refer to Application Note AN1012.

SPI Bus Characteristics

The Serial Peripheral interface (SPI) bus is intended for synchronous communication between different ICs. It consists of four signal lines: Serial Data Input (SDI), Serial Data Output (SDO), Serial Clock (SCL) and a Chip Enable (E).

By definition a device that gives out a message is called "transmitter," the receiving device that gets the message is called "receiver." The device that controls the message is called "master." The devices that are controlled by the master are called "slaves."

The \overline{E} input is used to initiate and terminate a data transfer. The SCL input is used to synchronize data transfer between the master (micro) and the slave (M41ST95Y/W) devices.

The SCL input, which is generated by the microcontroller, is active only during address and data transfer to any device on the SPI bus (see Figure 7., page 8).

The M41ST95Y/W can be driven by a microcontroller with its SPI peripheral running in either of the two following modes:

(CPOL, CPHA) = ('0', '0') or

(CPOL, CPHA) = ('1', '1').

For these two modes, input data (SDI) is latched in by the low-to-high transition of clock SCL, and output data (SDO) is shifted out on the high-to-low transition of SCL (see Table 2., page 10 and Figure 8., page 10).

There is one clock for each bit transferred. Address and data bits are transferred in groups of eight bits. Due to memory size the second most significant address bit is a Don't Care (address bit 6).

<u>لرکم</u>

Signal Description

Serial Data Output (SDO). The output pin is used to transfer data serially out of the Memory. Data is shifted out on the falling edge of the serial clock.

Serial Data Input (SDI). The input pin is used to transfer data serially into the device. Instructions, addresses, and the data to be written, are each received this way. Input is latched on the rising edge of the serial clock.

Serial Clock (SCL). The serial clock provides the timing for the serial interface (as shown in Figure 9., page 11 and Figure 10., page 11). The W/R Bit, addresses, or data are latched, from the input pin, on the rising edge of the clock input. The output data on the SDO pin changes state after the falling edge of the clock input.

The M41ST95Y/W can be driven by a microcontroller with its SPI peripheral running in either of the two following modes:

(CPOL, CPHA) = ('0', '0') or

For these two modes, input data (SDI) is latched in by the low-to-high transition of clock SCL, and output data (SDO) is shifted out on the high-to-low transition of SCL (see Table 2 and Figure 8).

Chip Enable (\overline{E}). When \overline{E} is high, the memory device is deselected, and the SDO output pin is held in its high impedance state.

After power-on, a high-to-low transition on \overline{E} is required prior to the start of any operation.

Table 2. Function Table

| Mode | Ē | SCL | SDI | SDO | |
|---------------|---|----------------|----------------|------------------------------------|--|
| Disable Reset | Н | Input Disabled | Input Disabled | High Z | |
| WRITE | L | _ F | Data Bit latch | High Z | |
| READ | L | | Х | Next data bit shift ⁽¹⁾ | |

Note: 1. SDO remains at High Z until eight bits of data are ready to be shifted out during a READ.

| Table 3. AC Characteris | stics |
|-------------------------|-------|
|-------------------------|-------|

Note: 1. Valid for Ambient Operating Temperature: T_A = −40 to 85°C; V_{CC} = 4.5 to 5.5V or 2.7 to 3.6V (except where noted).
2. t_{CH} + t_{CL} ≥ 1/f_{SCL}
3. Value guaranteed by design, not 100% tested in production.

READ and WRITE Cycles

Address and data are shifted MSB first into the Serial Data Input (SDI) and out of the Serial Data Output (SDO). Any data transfer considers the first bit to define whether a READ or WRITE will occur. This is followed by seven bits defining the address to be read or written. Data is transferred out of the SDO for a READ operation and into the SDI for a WRITE operation. The address is always the second through the eighth bit written after the Enable (E) pin goes low. If the first bit is a '1,' one or more WRITE cycles will occur. If the first bit is a '0,' one or more READ cycles will occur (see Figure 12 and Figure 13., page 14).

Data transfers can occur one byte at a time or in multiple byte burst mode, during which the address pointer will be automatically incremented. For a single byte transfer, one byte is read or written and then \overline{E} is driven high. For a multiple byte transfer all that is required is that \overline{E} continue to remain low. Under this condition, the address pointer will continue to increment as stated previously. Incrementing will continue until the device is deselected by taking \overline{E} high. The address will wrap to 00h after incrementing to 3Fh.

The system-to-user transfer of clock data will be halted whenever the address being read is a clock address (00h to 07h). Although the clock continues to maintain the correct time, this will prevent updates of time and date during either a READ or WRITE of these address locations by the user. The update will resume either due to a deselect condition or when the pointer increments to an non-clock or RAM address (08h to 3Fh).

Note: This is true both in READ and WRITE mode.

<u>ل</u>حک

Data Retention Mode

With valid V_{CC} applied, the M41ST95Y/W can be accessed as described above with READ or WRITE Cycles. Should the supply voltage decay, the M41ST95Y/W will automatically deselect, write protecting itself (and any external SRAM) when V_{CC} falls between $V_{PFD}(\text{max})$ and VPFD(min). This is accomplished by internally inhibiting access to the clock registers. At this time, the Reset pin (RST) is driven active and will remain active until V_{CC} returns to nominal levels. External RAM access is inhibited in a similar manner by forcing E_{CON} to a high level. This level is within 0.2 volts of the VBAT. ECON will remain at this level as long as V_{CC} remains at an out-of-tolerance condition. When V_{CC} falls below the Battery Back-up Switchover Voltage (V_{SO}), power input is switched from the V_{CC} pin to the SNAPHAT® battery, and the clock registers and external SRAM are maintained from the attached battery supply.

All outputs become high impedance. The V_{OUT} pin is capable of supplying 100 μ A of current to the attached memory with less than 0.3 volts drop under this condition. On power up, when V_{CC} returns to a nominal value, write protection continues for t_{REC} by inhibiting E_{CON}. The RST signal also remains active during this time (see Figure 21., page 28).

Note: Most low power SRAMs on the market today can be used with the M41ST95Y/W RTC SU-PERVISOR. There are, however some criteria which should be used in making the final choice of an SRAM to use. The SRAM must be designed in a way where the chip enable input disables all other inputs to the SRAM. This allows inputs to the M41ST95Y/W and SRAMs to be "Don't Care" once V_{CC} falls below V_{PFD} (min). The SRAM should also guarantee data retention down to $V_{CC} = 2.0$ volts. The chip enable access time must be sufficient to meet the system needs with the chip enable output propagation delays included. If the SRAM includes a second chip enable pin (E2), this pin should be tied to V_{OUT} .

If data retention lifetime is a critical parameter for the system, it is important to review the data retention current specifications for the particular SRAMs being evaluated. Most SRAMs specify a data retention current at 3.0 volts. Manufacturers generally specify a typical condition for room temperature along with a worst case condition (generally at elevated temperatures). The system level requirements will determine the choice of which value to use. The data retention current value of the SRAMs can then be added to the IBAT value of the M41ST95Y/W to determine the total current requirements for data retention. The available battery capacity for the SNAPHAT® of your choice can then be divided by this current to determine the amount of data retention available (see 20).

For a further more detailed review of lifetime calculations, please see Application Note AN1012.

CLOCK OPERATION

The eight byte clock register (see Table 4., page 16) is used to both set the clock and to read the date and time from the clock, in a binary coded decimal format. Tenths/Hundredths of Seconds, Seconds, Minutes, and Hours are contained within the first four registers.

Note: The Tenths/Hundredths of Seconds cannot be written to any value other than "00."

Bits D6 and D7 of Clock Register 03h (Century/ Hours Register) contain the CENTURY ENABLE Bit (CEB) and the CENTURY Bit (CB). Setting CEB to a '1' will cause CB to toggle, either from '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0,' CB will not toggle. Bits D0 through D2 of Register 04h contain the Day (day of week). Registers 05h, 06h, and 07h contain the Date (day of month), Month and Years. The ninth clock register is the Control Register (this is described in the Clock Calibration section). Bit D7 of Register 01h contains the STOP Bit (ST). Setting this bit to a '1' will cause the oscillator to stop. If the device is expected to spend a significant amount of time on the shelf, the oscillator may be stopped to reduce current drain. When reset to a '0' the oscillator restarts within one second.

The eight Clock Registers may be read one byte at a time, or in a sequential block. The Control Register (Address location 08h) may be accessed independently. Provision has been made to assure that a clock update does not occur while any of the eight clock addresses are being read. If a clock address is being read, an update of the clock registers will be halted. This will prevent a transition of data during the READ.

<u>ل</u>رکا

Power-down Time-Stamp

When a power failure occurs, the Halt Update Bit (HT) will automatically be set to a '1.' This will prevent the clock from updating the clock registers, and will allow the user to read the exact time of the power-down event. Resetting the HT Bit to a '0' will allow the clock to update the clock registers with the current time.

TIMEKEEPER[®] Registers

The M41ST95Y/W offers 20 internal registers which contain Clock, Alarm, Watchdog, Flag, Square Wave and Control data (see Table 4., page 16). These registers are memory locations which contain external (user accessible) and internal copies of the data (usually referred to as BiPORT[™] TIMEKEEPER cells). The external copies are independent of internal functions except that they are updated periodically by the simultaneous transfer of the incremented internal copy. The internal divider (or clock) chain will be reset upon the completion of a WRITE to any clock address.

The system-to-user transfer of clock data will be halted whenever the clock addresses (00h to 07h) are being written. The update will resume either due to a deselect condition or when the pointer increments to a non-clock or RAM address.

TIMEKEEPER and Alarm Registers store data in BCD. Control, Watchdog and Square Wave Registers store data in Binary format.

15/35

Calibrating the Clock

The M41ST95Y/W is driven by a quartz-controlled oscillator with a nominal frequency of 32,768Hz. Uncalibrated clock accuracy will not exceed \pm 35 ppm (parts per million) oscillator frequency error at 25°C, which equates to about \pm 1.53 minutes per month. When the Calibration circuit is properly employed, accuracy improves to better than \pm 2 ppm at 25°C.

The oscillation rate of crystals changes with temperature (see Figure 18., page 24). Therefore, the M41ST95Y/W design employs periodic counter correction. The calibration circuit adds or subtracts counts from the oscillator divider circuit at the divide by 256 stage, as shown in Figure 19., page 24. The number of times pulses are blanked (subtracted, negative calibration) or split (added, positive calibration) depends upon the value loaded into the five Calibration Bits found in the Control Register. Adding counts speeds the clock up, subtracting counts slows the clock down.

The Calibration Bits occupy the five lower order bits (D4-D0) in the Control Register (8h). These bits can be set to represent any value between 0 and 31 in binary form. Bit D5 is a Sign Bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within a 64 minute cycle. The first 62 minutes in the cycle may, once per minute, have one second either shortened by 128 or lengthened by 256 oscillator cycles. If a binary '1' is loaded into the register, only the first 2 minutes in the 64 minute cycle will be modified; if a binary 6 is loaded, the first 12 will be affected, and so on.

Therefore, each calibration step has the effect of adding 512 or subtracting 256 oscillator cycles for every 125,829,120 actual oscillator cycles, that is +4.068 or -2.034 ppm of adjustment per calibration step in the calibration register. Assuming that the oscillator is running at exactly 32,768Hz, each of the 31 increments in the Calibration byte would represent +10.7 or -5.35 seconds per month which corresponds to a total range of +5.5 or -2.75 minutes per month.

Two methods are available for ascertaining how much calibration a given M41ST95Y/W may require.

The first involves setting the clock, letting it run for a month and comparing it to a known accurate reference and recording deviation over a fixed period of time. Calibration values, including the number of seconds lost or gained in a given period, can be found in Application Note AN934: TIMEKEEPER CALIBRATION. This allows the designer to give the end user the ability to calibrate the clock as the environment requires, even if the final product is packaged in a non-user serviceable enclosure. The designer could provide a simple utility that accesses the Calibration Byte.

The second approach is better suited to a manufacturing environment, and involves the use of the IRQ/FT/OUT pin. The pin will toggle at 512Hz, when the Stop Bit (ST, D7 of 1h) is '0,' the Frequency Test Bit (FT, D6 of 8h) is '1,' the Alarm Flag Enable Bit (AFE, D7 of Ah) is '0,' and the Watchdog Steering Bit (WDS, D7 of 9h) is '1' or the Watchdog Register (9h = 0) is reset.

Any deviation from 512Hz indicates the degree and direction of oscillator frequency shift at the test temperature. For example, a reading of 512.010124Hz would indicate a +20 ppm oscillator frequency error, requiring a -10 (XX001010) to be loaded into the Calibration Byte for correction.

Note: Setting or changing the Calibration Byte does not affect the Frequency Test output frequency.

The $\overline{IRQ}/FT/OUT$ pin is an open drain output which requires a pull-up resistor for proper operation. A 500 to $10k\Omega$ resistor is recommended in order to control the rise time. The FT Bit is cleared on power-down.

Setting Alarm Clock Registers

Address locations 0Ah-0Eh contain the alarm settings. The alarm can be configured to go off at a prescribed time on a specific month, date, hour, minute, or second, or repeat every year, month, day, hour, minute, or second. It can also be programmed to go off while the M41ST95Y/W is in the battery back-up to serve as a system wake-up call.

Bits RPT5-RPT1 put the alarm in the repeat mode of operation. Table 5., page 18 shows the possible configurations. Codes not listed in the table default to the once per second mode to quickly alert the user of an incorrect alarm setting.

When the clock information matches the alarm clock settings based on the match criteria defined by RPT5-RPT1, the AF (Alarm Flag) is set. If AFE (Alarm Flag Enable) is also set, the alarm condition activates the IRQ/FT/OUT pin.

Note: If the address pointer is allowed to increment to the Flag Register address, an alarm condition will not cause the Interrupt/Flag to occur until the address pointer is moved to a different address.

It should also be noted that if the last address written is the "Alarm Seconds," the address pointer will increment to the Flag address, causing this situation to occur.

To disable the alarm, write '0' to the Alarm Date Register and to RPT1-5. The IRQ/FT/OUT output is cleared by a READ to the Flags Register as shown in Figure 14. A subsequent READ of the Flags Register is necessary to see that the value of the Alarm Flag has been reset to '0.'

The IRQ/FT/OUT pin can also be activated in the battery back-up mode. The IRQ/FT/OUT will go low if an alarm occurs and both ABE (Alarm in Battery Back-up Mode Enable) and AFE are set.

The ABE and AFE Bits are reset during power-up, therefore an alarm generated during power-up will only set AF. The user can read the Flag Register at system boot-up to determine if an alarm was generated while the M41ST95Y/W was in the deselect mode during power-up. Figure 15., page 19 illustrates the back-up mode alarm timing.

Figure 14. Alarm Interrupt Reset Waveform

Table 5. Alarm Repeat Mode

| RPT5 | RPT4 | RPT3 | RPT2 | RPT1 | Alarm Setting | |
|------|------|------|------|------|-----------------|--|
| 1 | 1 | 1 | 1 | 1 | Once per Second | |
| 1 | 1 | 1 | 1 | 0 | Once per Minute | |

| 1 | 0 | 0 | 0 | 0 | Once per Month | |
| 0 | 0 | 0 | 0 | 0 | Once per Year | |

Watchdog Timer

The watchdog timer can be used to detect an outof-control microprocessor. The user programs the watchdog timer by setting the desired amount of time-out into the Watchdog Register, address 09h. Bits BMB4-BMB0 store a binary multiplier and the two lower order bits RB1-RB0 select the resolution, where $00 = \frac{1}{16}$ second, $01 = \frac{1}{4}$ second, 10 = 1 second, and 11 = 4 seconds. The amount of time-out is then determined to be the multiplication of the five-bit multiplier value with the resolution. (For example: writing 00001110 in the Watchdog Register = 3*1 or 3 seconds).

Note: Accuracy of timer is within \pm the selected resolution.

If the processor does not reset the timer within the specified period, the M41ST95Y/W sets the WDF (Watchdog Flag) and generates a watchdog interrupt or a microprocessor reset. WDF is reset by reading the Flags Register (0Fh).

The most significant bit of the Watchdog Register is the Watchdog Steering Bit (WDS). When set to a '0,' the watchdog will activate the $\overline{IRQ}/FT/OUT$ pin when timed-out. When WDS is set to a '1,' the watchdog will output a negative pulse on the RST pin for $t_{REC}.$

The Watchdog register and the AFE, ABE, SQWE, and FT Bits will reset to a '0' at the end of a Watchdog time-out when the WDS Bit is set to a '1.' The watchdog timer can be reset by two methods:

- 1. a transition (high-to-low or low-to-high) can be applied to the Watchdog Input pin (WDI), or
- 2. the microprocessor can perform a WRITE of the Watchdog Register.

The time-out period then starts over. The WDI pin should be tied to V_{SS} if not used. In order to perform a software reset of the watchdog timer, the original time-out period can be written into the Watchdog Register, effectively restarting the count-down cycle.

Should the watchdog timer time-out, and the WDS Bit is programmed to output an interrupt, a value of 00h needs to be written to the Watchdog Register in order to clear the IRQ/FT/OUT pin. This will also disable the watchdog function until it is again programmed correctly. A READ of the Flags Register will reset the Watchdog Flag (Bit D7; Register 0Fh).

The watchdog function is automatically disabled upon power-up and the Watchdog Register is cleared. If the watchdog function is set to output to the IRQ/FT/OUT pin and the Frequency Test (FT) function is activated, the watchdog function prevails and the Frequency Test function is denied.

Square Wave Output

The M41ST95Y/W offers the user a programmable square wave function which is output on the SQW pin. RS3-RS0 bits located in 13h establish the square wave output frequency. These frequencies are listed in Table 6. Once the selection of the SQW frequency has been completed, the SQW pin can be turned on and off under software control with the Square Wave Enable Bit (SQWE) located in Register 0Ah.

| | Square V | Square | e Wave | | |
|-----|----------|--------------|--------|-----------|-------|
| RS3 | RS2 | RS1 RS0 Free | | Frequency | Units |
| 0 | 0 | 0 | 0 | None | - |
| 0 | 0 | 0 | 1 | 32.768 | kHz |
| 0 | 0 | 1 | 0 | 8.192 | kHz |
| 0 | 0 | 1 | 1 | 4.096 | kHz |
| 0 | 1 | 0 | 0 | 2.048 | kHz |
| 0 | 1 | 0 | 1 | 1.024 | kHz |
| 0 | 1 | 1 | 0 | 512 | Hz |
| 0 | 1 | 1 | 1 | 256 | Hz |

| 1 | 0 | 0 | 1 | 64 | Hz |
| 1 | 0 | 1 | 0 | 32 | Hz |
| 1 | 0 | 1 | 1 | 16 | Hz |
| 1 | 1 | 0 | 0 | 8 | Hz |
| 1 | 1 | 0 | 1 | 4 | Hz |
| 1 | 1 | 1 | 0 | 2 | Hz |
| 1 | 1 | 1 | 1 | 1 | Hz |

Table 6. Square Wave Output Frequency

Full-time F_{32k} Square Wave Output (Available only in 28-pin, 300mil SOIC (MX) package).

The M41ST95Y/W offers the user a special 32kHz square wave function which is always output on the F_{32k} pin (Pin 21) as long as $V_{CC} \ge V_{SO}$, and the oscillator is running (ST Bit = '0'). This function is available within four seconds of initial power-up

and can only be disabled by setting the ST Bit to '1,' or while the device is in back-up. If not used, the F_{32k} pin should be disconnected and allowed to float.

Power-on Reset

The M41ST95Y/W continuously monitors V_{CC}. When V_{CC} falls to the power fail detect trip point, the RST pulls low (open drain) and remains low on power-up for t_{REC} after V_{CC} passes V_{PFD} (max). The RST pin is an open drain output and an appropriate pull-up resistor should be chosen to control rise time.

Reset Input (RSTIN1 and RSTIN2)

The M41ST95Y/W provides two independent inputs which can generate an output reset. The duration and function of these resets is identical to a reset generated by a power cycle. Table 7 and Figure 16 illustrate the AC reset characteristics of this function. Pulses shorter than t_{RLRH1} and t_{RLRH2} will not generate a reset condition. RSTIN1 and RSTIN2 are each internally pulled up to V_{CC} through a 100k Ω resistor.

Figure 16. RSTIN1 and RSTIN2 Timing Waveforms

Note: 1. Open Drain Output

Table 7. Reset AC Characteristics

| Symbol | Parameter ⁽¹⁾ | Min | Мах | Unit |
|-------------------------------------|---------------------------|-----|-----|------|
| t _{RLRH1} ⁽²⁾ | RSTIN1 Low to RSTIN1 High | 200 | | ns |
| t _{RLRH2} ⁽³⁾ | RSTIN2 Low to RSTIN2 High | 100 | | ms |
| t _{R1HRH} ⁽⁴⁾ | RSTIN1 High to RST High | 96 | 98 | ms |
| t _{R2HRH} ^(4,5) | RSTIN2 High to RST High | 96 | 98 | ms |

Note: 1. Valid for Ambient Operating Temperature: $T_A = -40$ to 85° C; $V_{CC} = 4.5$ to 5.5V or 2.7 to 3.6V (except where noted).

2. Pulse width less than 50ns will result in no RESET (for noise immunity).

3. Pulse width less than 20ms will result in no RESET (for noise immunity).

4. Programmable (see Table 8., page 23)

5. After crystal oscillator has started

Power-fail INPUT/OUTPUT

The Power-Fail Input (PFI) is compared to an internal reference voltage (1.25V). If PFI is less than the power-fail threshold (V_{PFI}), the Power-Fail Output (PFO) will go low. This function is intended for use as an under-voltage detector to signal a failing power supply. Typically PFI is connected through an external voltage divider (see Figure 17) to either the unregulated DC input (if it is available) or the regulated output of the V_{CC} regulator. The voltage divider can be set up such that the voltage at PFI falls below V_{PFI} several milliseconds before the regulated V_{CC} input to the M41ST95Y/W or the microprocessor drops below the minimum operating voltage. During batter<u>y</u> back-up, the power-fail comparator turns off and PFO goes (or remains) low. This occurs after V_{CC} drops below V_{PFD}(min). When power returns, PFO is forced high, irrespective of V_{PFI} for the write protect time (t_{REC}), which is the time from V_{PFD}(max) until the inputs are recognized. At the end of this time, the power-fail comparator is enabled and PFO follows PFI. If the comparator is unused, PFI should be connected to V_{SS} and PFO left unconnected.

Note: 1. Available only in 28-pin, 300mil SOIC (MX) package.

Century Bit

Bits D7 and D6 of Clock Register 03h contain the CENTURY ENABLE Bit (CEB) and the CENTURY Bit (CB). Setting CEB to a '1' will cause CB to toggle, either from a '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0,' CB will not toggle.

Output Driver Pin

When the FT Bit, AFE Bit and Watchdog Register are not set, the IRQ/FT/OUT pin becomes an output driver that reflects the contents of D7 of the Control Register. In other words, when D7 (OUT Bit) and D6 (FT Bit) of address location 08h are a '0,' then the IRQ/FT/OUT pin will be driven low.

Note: The IRQ/FT/OUT pin is an open drain which requires an external pull-up resistor.

Battery Low Warning

The M41ST95Y/W automatically performs battery voltage monitoring upon power-up and at factoryprogrammed time intervals of approximately 24 hours. The Battery Low (BL) Bit, Bit D4 of Flags Register 0Fh, will be asserted if the battery voltage is found to be less than approximately 2.5V. The BL Bit will remain asserted until completion of battery replacement and subsequent battery low monitoring tests, either during the next power-up sequence or the next scheduled 24-hour interval.

If a battery low is generated during a power-up sequence, this indicates that the battery is below approximately 2.5 volts and may not be able to maintain data integrity in the SRAM. Data should be considered suspect and verified as correct. A fresh battery should be installed. If a battery low indication is generated during the 24-hour interval check, this indicates that the battery is near end of life. However, data is not compromised due to the fact that a nominal V_{CC} is supplied. In order to insure data integrity during subsequent periods of battery back-up mode, the battery should be replaced. The SNAPHAT[®] top may be replaced while V_{CC} applied to the device.

The M41ST95Y/W only monitors the battery when a nominal V_{CC} is applied to the device. Thus applications which require extensive durations in the battery back-up mode should be powered-up periodically (at least once every few months) in order for this technique to be beneficial. Additionally, if a battery low is indicated, data integrity should be verified upon power-up via a checksum or other technique.

t_{REC} Bit

Bit D7 of Clock Register 04h contains the t_{REC} Bit (TR). t_{REC} refers to the automatic continuation of the deselect time after V_{CC} reaches V_{PFD}. This allows for a voltage setting time before WRITEs may again be performed to the device after a powerdown condition. The t_{REC} Bit will allow the user to set the length of this deselect time as defined by Table 8.

Preferred Power-on Defaults

Upon initial application of power to the device, the following register bits are set to a '0' state: Watchdog Register, TR, FT, AFE, ABE, and SQWE. The following bits are set to a '1' state: OUT and HT (see Table 9).

| t _{REC} Bit (TR) | STOP Bit (ST) | t _{REC} | Units | |
|---------------------------|---------------|------------------|-------------------|-------|
| | 510F Bit (51) | Min | Max | Units |
| 0 | 0 | 96 | 98 ⁽¹⁾ | ms |
| 0 | 1 | 40 | 200 | ms |
| 1 | Х | 50 | 2000 | μs |

Table 8. t_{REC} Definitions

Note: 1. Default Setting; after oscillator has started

Table 9. Default Values

MAXIMUM RATING

Stressing the device above the rating listed in the "Absolute Maximum Ratings" table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is

not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

 Table 10. Absolute Maximum Ratings

| Symbol | Parameter | Value | Unit | |
|-----------------------------------|---|---|------------------------------|----|
| T _{STG} | Storage Temperature (VCC Off, Oscillator Off) | | -55 to 125 | °C |
| Vcc | Supply Voltage | M41ST95Y | -0.3 to 7 | V |
| VCC | Supply voltage | M41ST95W | -0.3 to 4.6 | V |
| | | Lead-free lead finish ⁽¹⁾ | 260 | °C |
| T _{SLD} | Lead Solder Temperature for 10 seconds | Standard (SnPb) lead finish ^(2,3) | 240 | °C |
| T _{SLD} ^(1,2) | Lead Solder Temperature for 10 seconds | | 260 | °C |
| V _{IO} | Input or Output Voltage | | -0.3 to V _{CC} +0.3 | V |
| lo | Output Current | 20 | mA | |
| PD | Power Dissipation | 1 | W | |

Note: 1. For SOH28 package, Lead-free (Pb-free) lead finish: Reflow at peak temperature of 260°C (total thermal budget not to exceed 245°C for greater than 30 seconds).

2. For SOH28 package, standard (SnPb) lead finish: Reflow at peak temperature of 225°C (total thermal budget not to exceed 180°C for between 90 to 150 seconds).

3. The SOX28 package has Lead-free (Pb-free) lead finish, but cannot be exposed to peak reflow temperature in excess of 240°C (use same reflow profile as standard (SnPb) lead finish).

CAUTION: Negative undershoots below –0.3V are not allowed on any pin while in the Battery Back-up mode. **CAUTION:** Do NOT wave solder SOIC to avoid damaging SNAPHAT sockets.

DC AND AC PARAMETERS

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC Characteristic tables are derived from tests performed under the Measurement Conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

Table 11. DC and AC Measurement Conditions

| Parameter | M41ST95Y | M41ST95W |
|---------------------------------------|---------------------------|---------------------------|
| V _{CC} Supply Voltage | 4.5 to 5.5V | 2.7 to 3.6V |
| Ambient Operating Temperature | -40 to 85°C | –40 to 85°C |
| Load Capacitance (CL) | 100pF | 50pF |
| Input Rise and Fall Times | ≤ 50ns | ≤ 50ns |
| Input Pulse Voltages | 0.2 to 0.8V _{CC} | 0.2 to 0.8V _{CC} |
| Input and Output Timing Ref. Voltages | 0.3 to $0.7V_{CC}$ | 0.3 to 0.7 V_{CC} |

Note: Output Hi-Z is defined as the point where data is no longer driven.

Table 13. DC Characteristics

 Note: 1. Valid for Ambient Operating Temperature: T_A = -40 to 85°C; V_{CC} = 4.5 to 5.5V or 2.7 to 3.6V (except where noted).
 2. Measured with V_{OUT} and E_{CON} open.
 3. RSTIN1 and RSTIN2 internally pulled-up to V_{CC} through 100KΩ resistor. WDI internally pulled-down to V_{SS} through 100KΩ resistor. 4. Outputs Deselected.

5. External SRAM must match RTC SUPERVISOR chip V_{CC} specification.

6. For rechargeable back-up, V_{BAT}(max) may be considered V_{CC}. 7. For PFO, F_{32k}, and SQW pins (CMOS).

8. Conditioned output (ECON) can only sustain CMOS leakage current in the battery back-up mode. Higher leakage currents will reduce battery life.
9. For IRQ/FT/OUT, RST pins (Open Drain); if pulled-up to supply other than V_{CC}, this supply must be equal to, or less than 3.0V when

V_{CC} = 0V (during battery back-up mode).

Figure 21. Power Down/Up Mode AC Waveforms

Table 14. Power Down/Up AC Characteristics

| Symbol | Parameter ⁽¹⁾ | Min | Тур | Max | Unit |
|-----------------------------------|---|-----|-----|-----|------|
| t _F ⁽²⁾ | V_{PFD} (max) to V_{PFD} (min) V_{CC} Fall Time | 300 | | | μs |
| t _{FB} ⁽³⁾ | V _{PFD} (min) to V _{SS} V _{CC} Fall Time | 10 | | | μs |
| t _R | V_{PFD} (min) to V_{PFD} (max) V_{CC} Rise Time | 10 | | | μs |
| t _{RB} | $V_{\mbox{\scriptsize SS}}$ to $V_{\mbox{\scriptsize PFD}}$ (min) $V_{\mbox{\scriptsize CC}}$ Rise Time | 1 | | | μs |
| tPFD | PFI to PFO Propagation Delay | | 15 | 25 | μs |
| t _{REC} ^(4,5) | Power up Deselect Time | 96 | | 98 | ms |

Note: 1. Valid for Ambient Operating Temperature: $T_A = -40$ to 85°C; $V_{CC} = 4.5$ to 5.5V or 2.7 to 3.6V (except where noted).

2. VPFD (max) to VPFD (min) fall time of less than tF may result in deselection/write protection not occurring until 200µs after V_{CC} passes V_{PFD} (min).

VPFD (min) to Vss fall time of less than tFB may cause corruption of RAM data.
 Programmable (see Table 8., page 23)
 After crystal oscillator has started

PART NUMBERING

Table 19. Ordering Information Scheme

For SOH28:

blank = Tubes (Not for New Design - Use E)

E = Lead-free Package (ECO PACK[®]), Tubes

F = Lead-free Package (ECO PACK[®]), Tape & Reel

TR = Tape & Reel (Not for New Design - Use F)

For SOX28:

blank = Tubes

TR = Tape & Reel

Note: 1. Contact Local Sales Office

 The SOIC package (SOH28) requires the SNAPHAT[®] battery package which is ordered separately under the part number "M4TXX-BR12SH" in plastic tube or "M4TXX-BR12SHTR" in Tape & Reel form (see Table 20).

3. The SOX28 package includes an embedded 32,768Hz crystal.

Caution: Do not place the SNAPHAT battery package "M4TXX-BR12SH" in conductive foam as it will drain the lithium button-cell battery.

For other options, or for more information on any aspect of this device, please contact the ST Sales Office nearest you.

| | - | |
|--------------|--|---------|
| Part Number | Description | Package |
| M4T28-BR12SH | Lithium Battery (48mAh) and Crystal SNAPHAT | SH |
| M4T32-BR12SH | Lithium Battery (120mAh) and Crystal SNAPHAT | SH |

Table 20. SNAPHAT Battery Table

REVISION HISTORY

Table 21. Document Revision History

| Date | Rev. # | Revision Details |
|---------------|--------|--|
| February 2002 | 1.0 | First draft |
| 27-Mar-02 | 1.1 | Change t _{REC} Definition (Table 8) |
| 01-Apr-02 | 1.2 | Addition of new package option and inherent features |
| 12-Apr-02 | 2.0 | Document promoted |
| 21-Jan-03 | 2.1 | Add marketing note; (Figure 1); modify logic, signals (Figure 3; Table 1); modify block diagram (Figure 6) |
| 25-Feb-03 | 2.2 | Update Definitions (Table 8); correct mechanical dimensions (Figure 25; Table 18) |
| 20-Mar-03 | 3.0 | Document promoted |
| 27-Mar-03 | 3.1 | Add marketing status (Table 19) |
| 06-May-03 | 3.2 | Update 32kHz information (Figure 3, 5, 6, 17; Table 1, 13, 14, 7) |
| 15-Jun-04 | 4.0 | Reformatted; update characteristics; added Lead-free information (Figure 5, 6, 18; Table 1, 4, 7, 8, 10, 13, 14, 19) |
| 13-Sep-04 | 5.0 | Update Maximum ratings (Table 10) |
