DESCRIPTION

The VCXH16373 is a low voltage CMOS 16-BIT D-TYPE LATCH with 3 STATE OUTPUTS NON INVERTING fabricated with sub-micron silicon gate and five-layer metal wiring C²MOS technology. It is ideal for low power and very high speed 2.3 to 3.6V applications; it can be interfaced to 3.6V signal environment for both inputs and outputs.

These 16 bit D-Type latches are byte controlled by two latch enable inputs (nLE) and two output enable inputs ($\overline{\text{OE}}$).

While the nLE input is held at a high level, the nQ outputs will follow the data input precisely.

When the nLE is taken low, the nQ outputs will be latched precisely at the logic level of D input data.

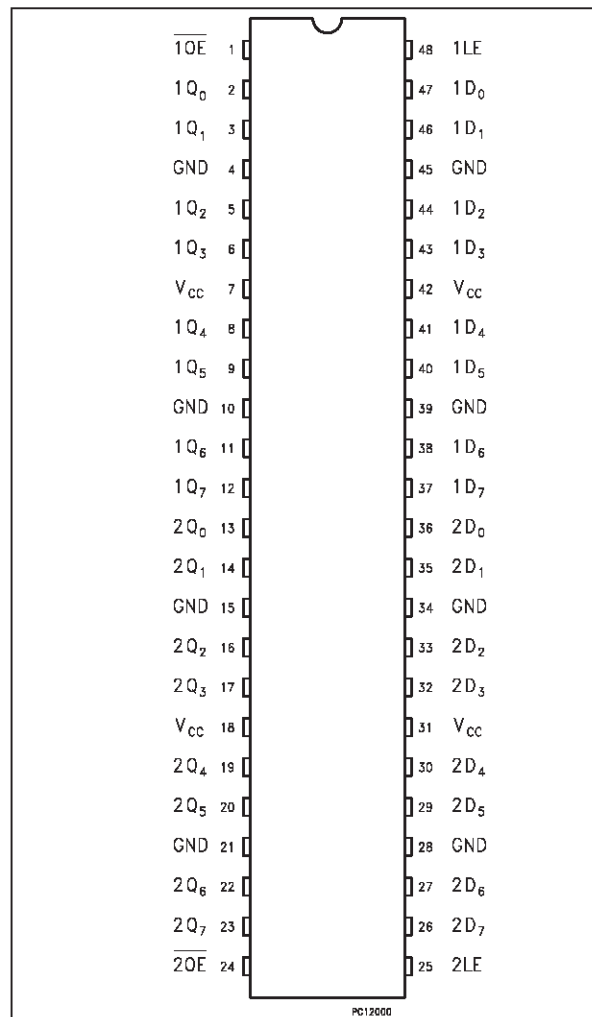

While the ($\overline{\text{nOE}}$) input is low, the nQ outputs will be in a normal logic state (high or low logic level) and while high level the outputs will be in a high impedance state.

This device is designed to be used with 3 state memory address drivers, etc. Bus hold on data inputs is provided in order to eliminate the need for external pull-up or pull-down resistor.

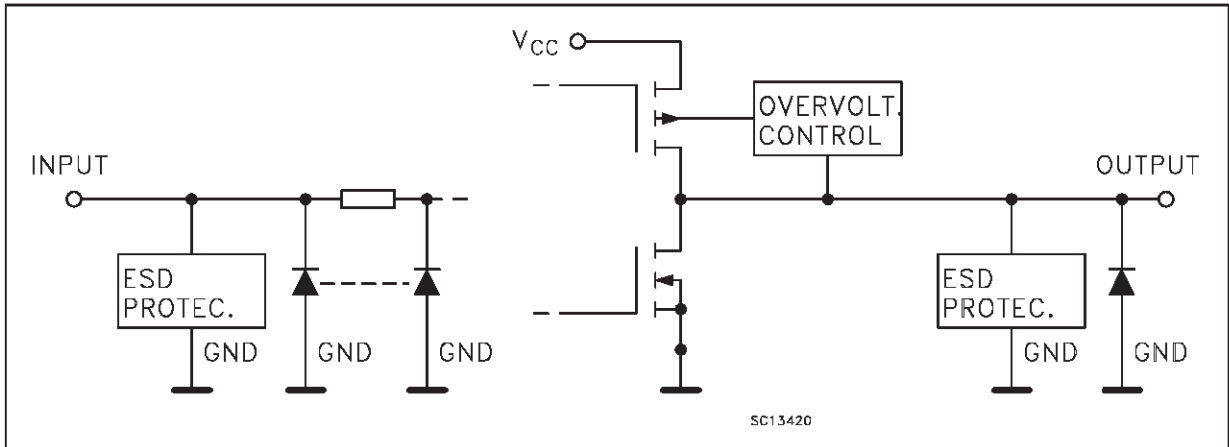

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.
