

HIGH-SPEED 4K x 8 DUAL-PORT STATIC SRAM

IDT7134SA/LA

Features

- ♦ **High-speed access**
 - Military: 25/35/45/55/70ns (max.)
 - Industrial: 55ns (max.)
 - Commercial: 20/25/35/45/55/70ns (max.)
- ♦ **Low-power operation**
 - IDT7134SA
 - Active: 700mW (typ.)
 - Standby: 5mW (typ.)
 - IDT7134LA
 - Active: 700mW (typ.)
 - Standby: 1mW (typ.)
- ♦ **Fully asynchronous operation from either port**
- ♦ **Battery backup operation—2V data retention**
- ♦ **TTL-compatible; single 5V ($\pm 10\%$) power supply**
- ♦ **Available in 48-pin DIP, LCC, Flatpack and 52-pin PLCC**
- ♦ **Military product compliant to MIL-PRF-38535 QML**
- ♦ **Industrial temperature range (-40°C to $+85^{\circ}\text{C}$) is available for selected speeds**

Description

The IDT7134 is a high-speed 4K x 8 Dual-Port Static RAM designed to be used in systems where on-chip hardware port arbitration is not needed. This part lends itself to those systems which cannot tolerate wait states or are designed to be able to externally arbitrate or withstand contention when both sides simultaneously access the same Dual-Port RAM location.

The IDT7134 provides two independent ports with separate control, address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. It is the user's responsibility to ensure data integrity when simultaneously accessing the same memory location from both ports. An automatic power down feature, controlled by $\overline{\text{CE}}$, permits the on-chip circuitry of each port to enter a very low standby power mode.

Fabricated using IDT's CMOS high-performance technology, these Dual-Port typically operate on only 700mW of power. Low-power (LA) versions offer battery backup data retention capability, with each port typically consuming 200 μW from a 2V battery.

The IDT7134 is packaged on either a sidebraze or plastic 48-pin DIP, 48-pin LCC, 52-pin PLCC and 48-pin Flatpack. Military grade product is manufactured in compliance with the latest revision of MIL-PRF-38535 QML, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

Functional Block Diagram

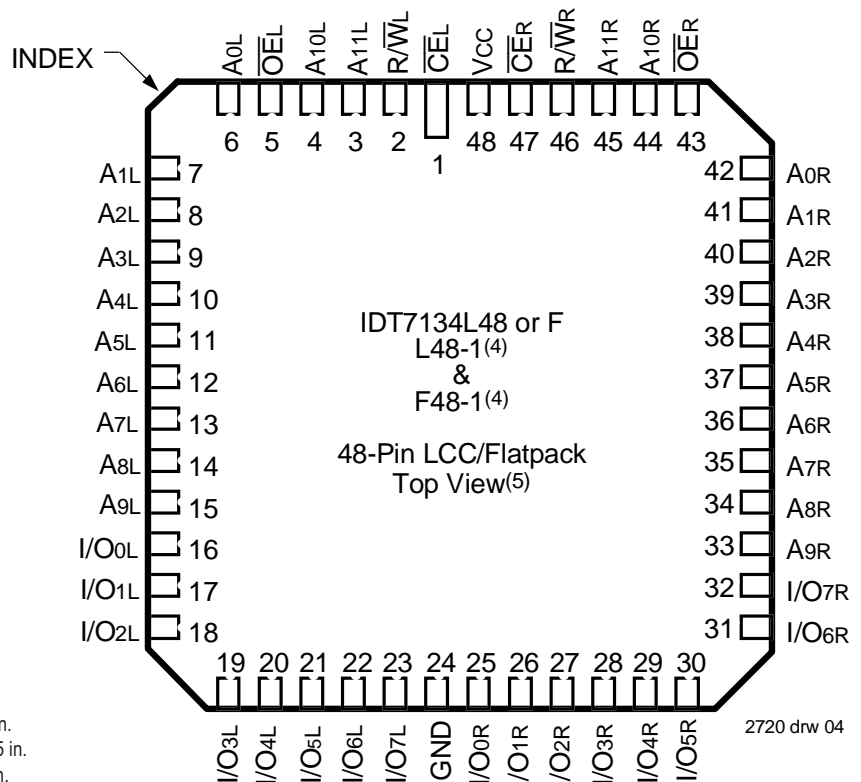

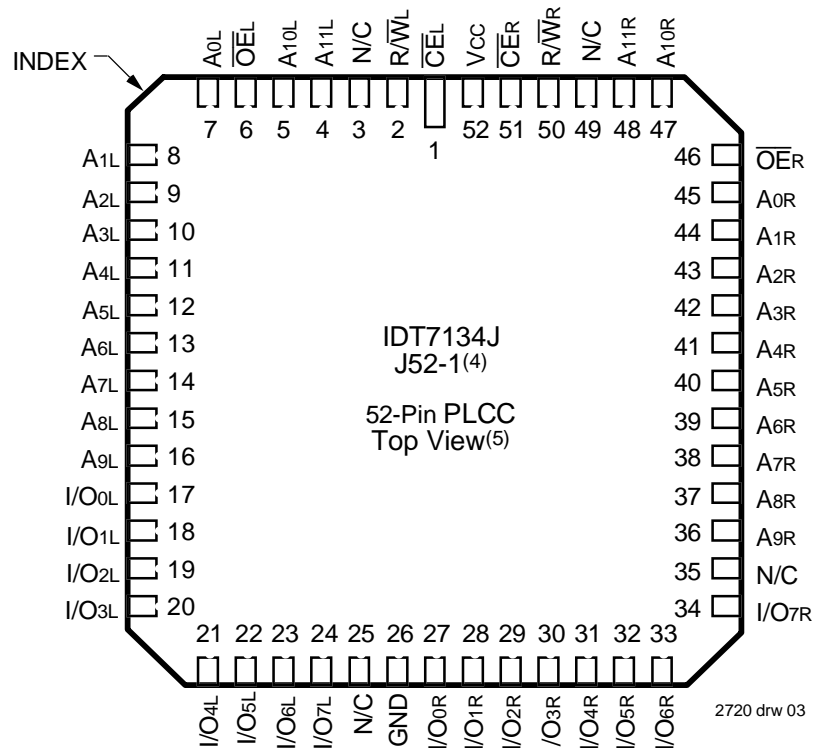

2720 drw 01

JUNE 1999

Pin Configurations^(1,2,3)

2720 drw 02

NOTES:

1. All V_{CC} pins must be connected to the power supply.
2. All GND pins must be connected to the ground supply.
3. P48-1 package body is approximately .55 in x .61 in x .19 in.
C48-2 package body is approximately .62 in x 2.43 in x .15 in.
J52-1 package body is approximately .75 in x .75 in x .17 in.
L48-1 package body is approximately .57 in x .57 in x .68 in.
F48-1 package body is approximately .75 in x .75 in x .11 in.
4. This package code is used to reference the package diagram.
5. This text does not indicate orientation of actual part-marking.

Absolute Maximum Ratings⁽¹⁾

Symbol	Rating	Commercial & Industrial	Military	Unit
V _{TERM} ⁽²⁾	Terminal Voltage with Respect to GND	-0.5 to +7.0	-0.5 to +7.0	V
T _{BIAS}	Temperature Under Bias	-55 to +125	-65 to +135	°C
T _{STG}	Storage Temperature	-55 to +125	-65 to +150	°C
P _T ⁽³⁾	Power Dissipation	1.5	1.5	W
I _{OUT}	DC Output Current	50	50	mA

2720 tbl 01

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{TERM} must not exceed V_{CC} + 10% for more than 25% of the cycle time or 10 ns maximum, and is limited to ≤ 20mA for the period of V_{TERM} ≥ V_{CC} + 10%.
- V_{TERM} = 5.5V.

Capacitance⁽¹⁾ (T_A = +25°C, f = 1.0MHz)

Symbol	Parameter	Conditions ⁽²⁾	Max.	Unit
C _{IN}	Input Capacitance	V _{IN} = 3dV	11	pF
C _{OUT}	Output Capacitance	V _{OUT} = 3dV	11	pF

2720 tbl 02

NOTES:

- This parameter is determined by device characterization but is not production tested.
- 3dV references the interpolated capacitance when the input and output signals switch from 0V to 3V and from 3V to 0V.

Recommended Operating Temperature and Supply Voltage^(1,2)

Grade	Ambient Temperature	GND	V _{CC}
Military	-55°C to +125°C	0V	5.0V ± 10%
Commercial	0°C to +70°C	0V	5.0V ± 10%
Industrial	-40°C to +85°C	0V	5.0V ± 10%

2720 tbl 03

NOTES:

- This is the parameter T_A.
- Industrial temperature: for specific speeds, packages and powers contact your sales office.

Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{CC}	Supply Voltage	4.5	5.0	5.5	V
GND	Ground	0	0	0	V
V _{IH}	Input High Voltage	2.2	—	6.0 ⁽²⁾	V
V _{IL}	Input Low Voltage	-0.5 ⁽¹⁾	—	0.8	V

2720 tbl 04

NOTES:

- V_{IL} (min.) ≥ -1.5V for pulse width less than 10ns.
- V_{TERM} must not exceed V_{CC} + 10%.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (V_{CC} = 5V ± 10%)

Symbol	Parameter	Test Conditions	7134SA		7134LA		Unit
			Min.	Max.	Min.	Max.	
I _{LI}	Input Leakage Current ⁽¹⁾	V _{CC} = 5.5V, V _{IN} = 0V to V _{CC}	—	10	—	5	μA
I _{LO}	Output Leakage Current	\overline{CE} - V _{IH} , V _{OUT} = 0V to V _{CC}	—	10	—	5	μA
V _{OL}	Output Low Voltage	I _{OL} = 6mA	—	0.4	—	0.4	V
		I _{OL} = 8mA	—	0.5	—	0.5	V
V _{OH}	Output High Voltage	I _{OH} = -4mA	2.4	—	2.4	—	V

NOTES:

- At V_{CC} ≤ 2.0V input leakages are undefined.

2720 tbl 10b

NOTES:

1. Transition is measured $\pm 500\text{mV}$ from Low or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. The specification for t_{DH} must be met by the device supplying write data to the RAM under all operating conditions. Although t_{DH} and t_{OW} values will vary over voltage and temperature, the actual t_{DH} will always be smaller than the actual t_{OW}.
4. Port-to-port delay through RAM cells from writing port to reading port, refer to "Timing Waveform of Write with Port-to-Port Read".
5. 'X' in part number indicates power rating (SA or LA).
6. t_{DDD} = 35ns for military temperature range.
7. Industrial temperature: for other speeds, packages and powers contact your sales office.

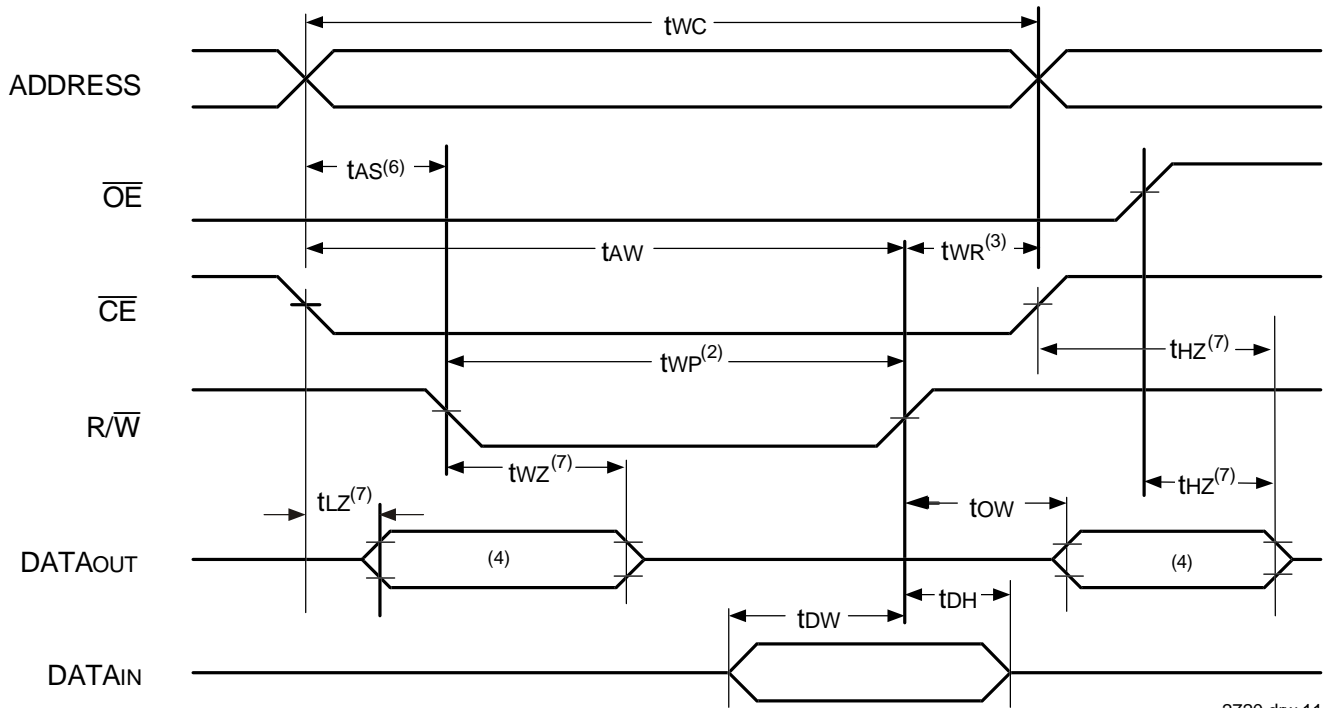

Timing Waveform of Write with Port-to-Port Read^(1,2,3)

NOTES:

1. Write cycle parameters should be adhered to, in order to ensure proper writing.
2. $\overline{CE}_L = \overline{CE}_R = V_{IL}$, $\overline{OE}^* = V_{IL}$.
3. Port "A" may be either left or right port. Port "B" is the opposite from port "A".

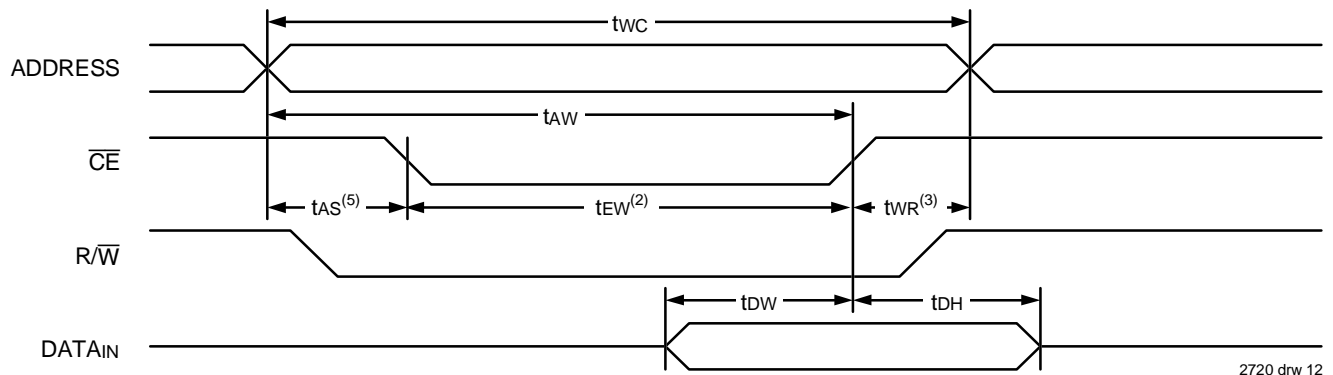

Timing Waveform of Write Cycle No. 1, R/W Controlled Timing^(1,5,8)

NOTES:

1. $\overline{R/W}$ or \overline{CE} must be HIGH during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a $\overline{CE} = V_{IL}$ and $\overline{R/W} = V_{IL}$.
3. t_{WR} is measured from the earlier of \overline{CE} or $\overline{R/W}$ going to V_{IH} to the end-of-write cycle.
4. During this period, the I/O pins are in the output state, and input signals must not be applied.
5. If the $\overline{CE} = V_{IL}$ transition occurs simultaneously with or after the $\overline{R/W} = V_{IL}$ transition, the outputs remain in the High-impedance state.
6. Timing depends on which enable signal (\overline{CE} or $\overline{R/W}$) is asserted last.
7. This parameter is guaranteed by device characterization, but is not production tested. Transition is measured $\pm 500mV$ from steady state with the Output Test Load (Figure 2).
8. If $\overline{OE} = V_{IL}$ during a $\overline{R/W}$ controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WZ} + t_{OW})$ to allow the I/O drivers to turn off data to be placed on the bus for the required t_{OW} . If $\overline{OE} = V_{IH}$ during an $\overline{R/W}$ controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .

Timing Waveform of Write Cycle No. 2, $\overline{\text{CE}}$ Controlled Timing^(1,4)

NOTES:

1. $\overline{\text{R/W}}$ or $\overline{\text{CE}}$ must be HIGH during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a $\overline{\text{CE}} = V_{IL}$ and $\overline{\text{R/W}} = V_{IL}$.
3. t_{WR} is measured from the earlier of $\overline{\text{CE}}$ or $\overline{\text{R/W}}$ going HIGH to the end-of-write cycle.
4. If the $\overline{\text{CE}}$ LOW transition occurs simultaneously with or after the $\overline{\text{R/W}}$ LOW transition, the outputs remain in the High-impedance state.
5. Timing depends on which enable signal ($\overline{\text{CE}}$ or $\overline{\text{R/W}}$) is asserted last.

Functional Description

The IDT7134 provides two ports with separate control, address, and I/O pins that permit independent access for reads or writes to any location in memory. These devices have an automatic power down feature controlled by $\overline{\text{CE}}$. The $\overline{\text{CE}}$ controls on-chip power down circuitry that permits the respective port to go into standby mode when not selected ($\overline{\text{CE}}$ HIGH). When a port is enabled, access to the entire memory array is permitted. Each port has its own Output Enable control ($\overline{\text{OE}}$). In the read mode, the port's $\overline{\text{OE}}$ turns on the output drivers when set LOW. Non-contention READ/WRITE conditions are illustrated in the table below.

Truth Table I – Read/Write Control

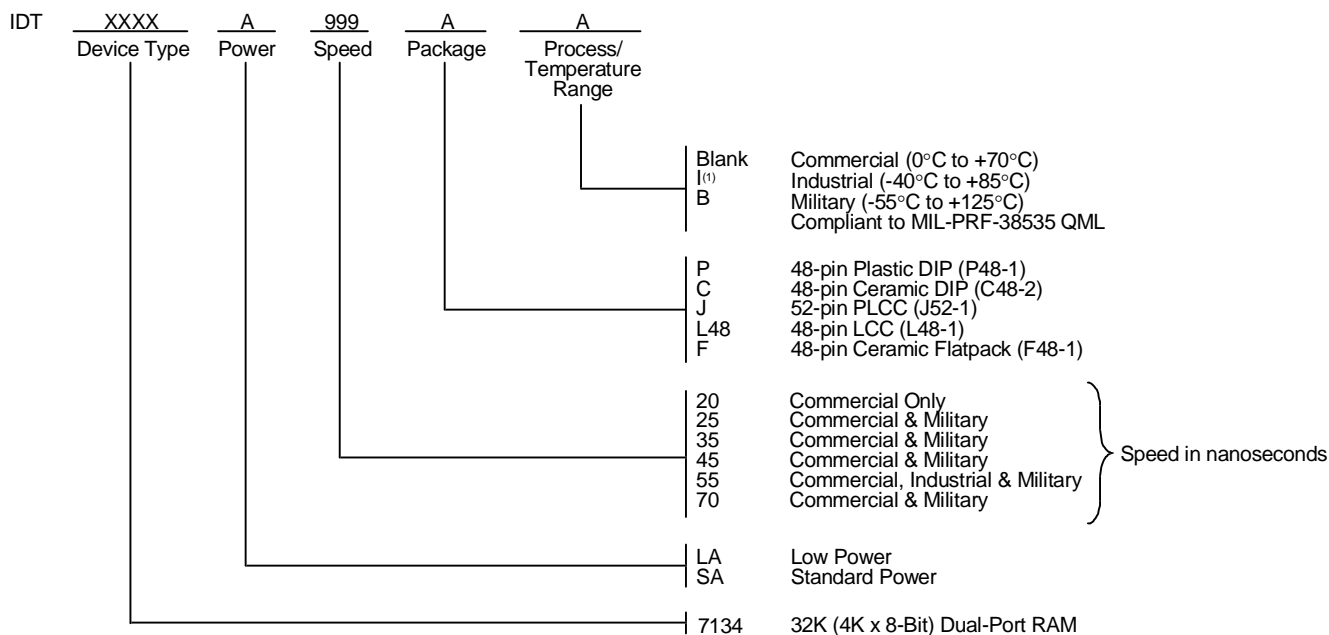

Left or Right Port ⁽¹⁾				
$\overline{\text{R/W}}$	$\overline{\text{CE}}$	$\overline{\text{OE}}$	D ₀₋₇	Function
X	H	X	Z	Port Deselected and in Power-Down Mode, ISB2 or ISB4
X	H	X	Z	$\overline{\text{CE}}_{\text{R}} = \overline{\text{CE}}_{\text{L}} = \text{H}$, Power Down Mode ISB1 or ISB3
L	L	X	DATA _{IN}	Data on port written into memory
H	L	L	DATA _{OUT}	Data in memory output on port
X	X	H	Z	High impedance outputs

2720 tbl 11

NOTE:

1. A_{0L} - A_{11L} \neq A_{0R} - A_{11R}
"H" = V_{IH} , "L" = V_{IL} , "X" = Don't Care, and "Z" = High Impedance
