Low-Voltage 1.8/2.5/3.3 V 16-Bit Transparent Latch With 3.6 V-Tolerant Inputs and Outputs (3-State, Non-Inverting)

The 74ALVC16373 is an advanced performance, non-inverting 16-bit transparent latch. It is designed for very high-speed, very low-power operation in 1.8 V, 2.5 V or 3.3 V systems. The ALVC16373 is byte controlled, with each byte functioning identically, but independently. Each byte has separate Output Enable and Latch Enable inputs. These control pins can be tied together for full 16-bit operation.

The 74ALVC16373 contains 16 D-type latches with 3-state 3.6 V-tolerant outputs. When the Latch Enable (LEn) inputs are HIGH, data on the Dn inputs enters the latches. In this condition, the latches are transparent, (a latch output will change state each time its D input changes). When LE is LOW, the latch stores the information that was present on the D inputs a setup time preceding the HIGH-to-LOW transition of LE. The 3-state outputs are controlled by the Output Enable (\overline{OE}) inputs. When \overline{OE} is LOW, the outputs are enabled. When \overline{OE} is HIGH, the standard outputs are in the high impedance state, but this does not interfere with new data entering into the latches.

- Designed for Low Voltage Operation: $V_{CC} = 1.65\text{--}3.6\text{ V}$
- 3.6V Tolerant Inputs and Outputs
- High Speed Operation: 3.6 ns max for 3.0 to 3.6 V
4.5 ns max for 2.3 to 2.7 V
6.8 ns max for 1.65 to 1.95 V
- Static Drive: $\pm 24\text{ mA}$ Drive at 3.0 V
 $\pm 12\text{ mA}$ Drive at 2.3 V
 $\pm 4\text{ mA}$ Drive at 1.65 V
- Supports Live Insertion and Withdrawal
- I_{OFF} Specification Guarantees High Impedance When $V_{CC} = 0\text{ V}^\dagger$
- Near Zero Static Supply Current in All Three Logic States (40 μA)
Substantially Reduces System Power Requirements
- Latchup Performance Exceeds $\pm 250\text{ mA}$ @ 125°C
- ESD Performance: Human Body Model >2000 V; Machine Model >200 V
- Second Source to Industry Standard 74ALVC16373

† To ensure the outputs activate in the 3-state condition, the output enable pins should be connected to V_{CC} through a pull-up resistor. The value of the resistor is determined by the current sinking capability of the output connected to the \overline{OE} pin.

10. For $C_L = 50$ pF, add approximately 300 ps to the AC maximum specification.

11. Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH-to-LOW (t_{OSHL}) or LOW-to-HIGH (t_{OSLH}); parameter guaranteed by design.
