

**256K x 36, 512K x 18
3.3V Synchronous ZBT™ SRAMs
2.5V I/O, Burst Counter
Flow-Through Outputs**

**Preliminary
IDT71V65702
IDT71V65902**

Features

- ◆ 256K x 36, 512K x 18 memory configurations
- ◆ Supports high performance system speed - 100 MHz (7.5 ns Clock-to-Data Access)
- ◆ ZBT™ Feature - No dead cycles between write and read cycles
- ◆ Internally synchronized output buffer enable eliminates the need to control \overline{OE}
- ◆ Single R/W (READ/WRITE) control pin
- ◆ 4-word burst capability (Interleaved or linear)
- ◆ Individual byte write ($\overline{BW1}$ - $\overline{BW4}$) control (May tie active)
- ◆ Three chip enables for simple depth expansion
- ◆ 3.3V power supply ($\pm 5\%$)
- ◆ 2.5V ($\pm 5\%$) I/O Supply (V_{DDQ})
- ◆ Power down controlled by ZZ input
- ◆ Packaged in a JEDEC standard 100-pin plastic thin quad flatpack (TQFP), 119 ball grid array (BGA) and 165 fine pitch ball grid array (fBGA).

Description

The IDT71V65702/5902 are 3.3V high-speed 9,437,184-bit (9 Megabit) synchronous SRAMs organized as 256K x 36 / 512K x 18. They are designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Thus they have been given the name ZBT™, or Zero Bus Turnaround.

Address and control signals are applied to the SRAM during one clock cycle, and on the next clock cycle the associated data cycle

occurs, be it read or write.

The IDT71V65702/5902 contain address, data-in and control signal registers. The outputs are flow-through (no output data register). Output enable is the only asynchronous signal and can be used to disable the outputs at any given time.

A Clock Enable (\overline{CEN}) pin allows operation of the IDT71V65702/5902 to be suspended as long as necessary. All synchronous inputs are ignored when \overline{CEN} is high and the internal device registers will hold their previous values.

There are three chip enable pins ($\overline{CE1}$, $CE2$, $\overline{CE2}$) that allow the user to deselect the device when desired. If any one of these three is not asserted when $\overline{ADV/LD}$ is low, no new memory operation can be initiated. However, any pending data transfers (reads or writes) will be completed. The data bus will tri-state one cycle after the chip is deselected or a write is initiated.

The IDT71V65702/5902 have an on-chip burst counter. In the burst mode, the IDT71V65702/5902 can provide four cycles of data for a single address presented to the SRAM. The order of the burst sequence is defined by the \overline{LBO} input pin. The \overline{LBO} pin selects between linear and interleaved burst sequence. The $\overline{ADV/LD}$ signal is used to load a new external address ($\overline{ADV/LD} = \text{LOW}$) or increment the internal burst counter ($\overline{ADV/LD} = \text{HIGH}$).

The IDT71V65702/5902 SRAMs utilize IDT's latest high-performance CMOS process, and are packaged in a JEDEC Standard 14mm x 20mm 100-pin plastic thin quad flatpack (TQFP) as well as a 119 ball grid array (BGA) and 165 fine pitch ball grid array (fBGA).

Pin Description Summary

| | | | |
|---|--|--------|--------------|
| A0-A18 | Address Inputs | Input | Synchronous |
| $\overline{CE1}$, $CE2$, $\overline{CE2}$ | Chip Enables | Input | Synchronous |
| \overline{OE} | Output Enable | Input | Asynchronous |
| $\overline{R/W}$ | Read/Write Signal | Input | Synchronous |
| \overline{CEN} | Clock Enable | Input | Synchronous |
| $\overline{BW1}$, $\overline{BW2}$, $\overline{BW3}$, $\overline{BW4}$ | Individual Byte Write Selects | Input | Synchronous |
| CLK | Clock | Input | N/A |
| $\overline{ADV/LD}$ | Advance Burst Address/Load New Address | Input | Synchronous |
| \overline{LBO} | Linear/Interleaved Burst Order | Input | Static |
| TMS | Test Mode Select | Input | N/A |
| TDI | Test Data Input | Input | N/A |
| TCK | Test Clock | Input | N/A |
| TDO | Test Data Output | Output | N/A |
| ZZ | Sleep Mode | Input | Asynchronous |
| I/O0-I/O31, I/OP1-I/OP4 | Data Input/Output | I/O | Synchronous |
| V_{DD} , V_{DDQ} | Core Power, I/O Power | Supply | Static |
| V_{SS} | Ground | Supply | Static |

Pin Definitions⁽¹⁾

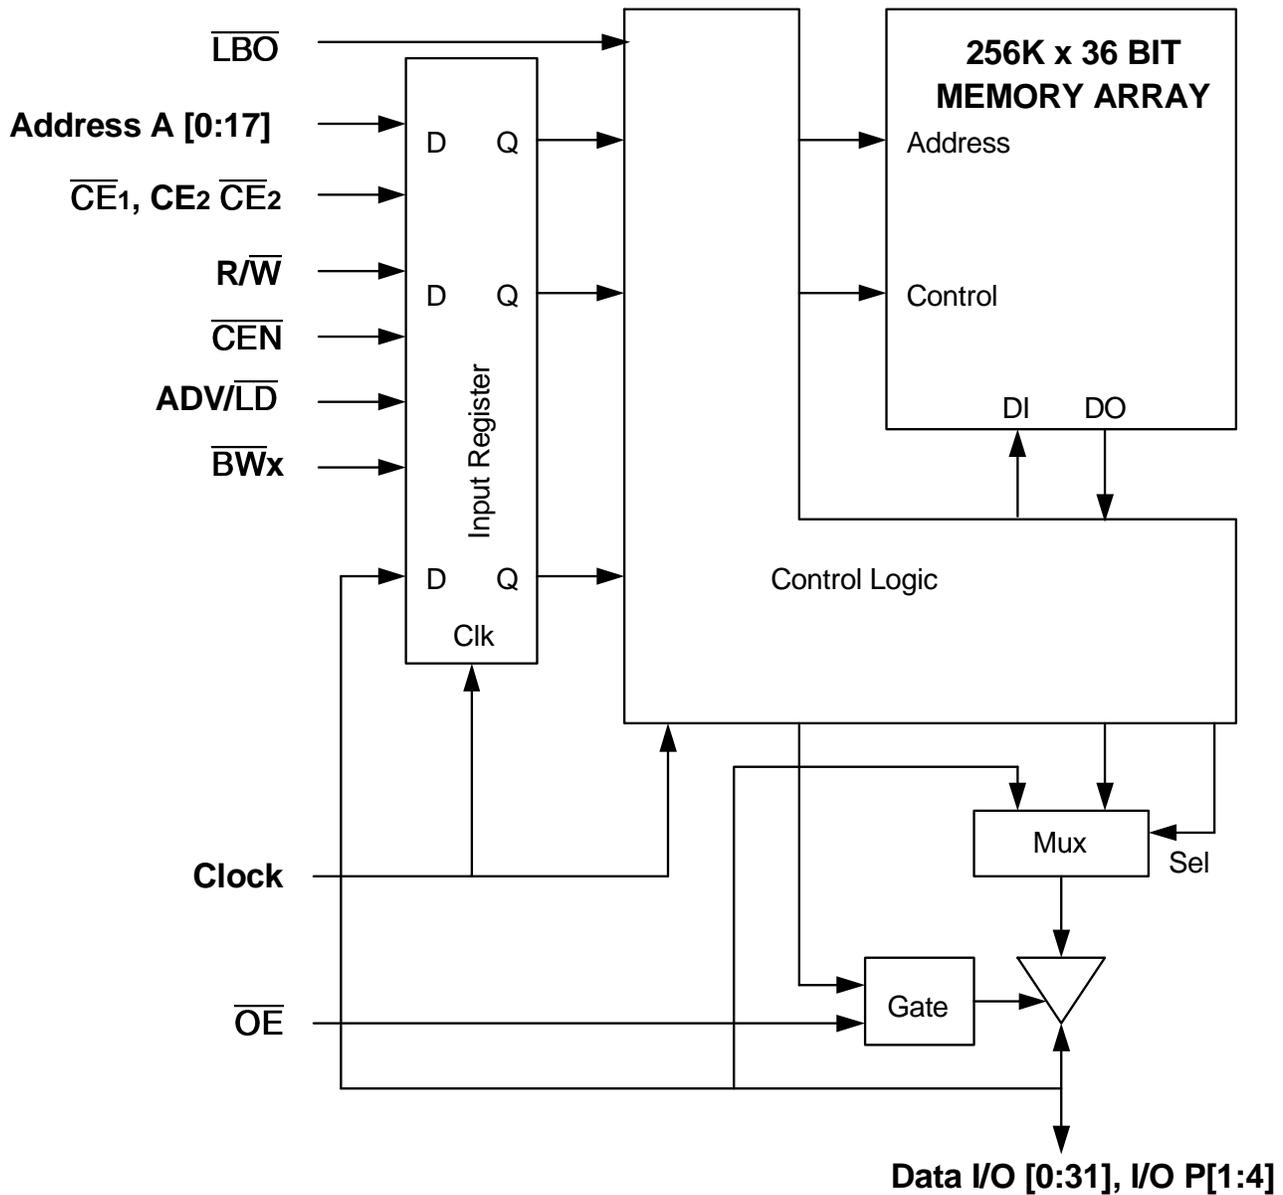

| Symbol | Pin Function | I/O | Active | Description |
|---|-------------------------------|-----|--------|--|
| A ₀ -A ₁₈ | Address Inputs | I | N/A | Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK, ADV/LD low, CEN low, and true chip enables. |
| ADV/LD | Advance / Load | I | N/A | ADV/LD is a synchronous input that is used to load the internal registers with new address and control when it is sampled low at the rising edge of clock with the chip selected. When ADV/LD is low with the chip deselected, any burst in progress is terminated. When ADV/LD is sampled high then the internal burst counter is advanced for any burst that was in progress. The external addresses are ignored when ADV/LD is sampled high. |
| R/W | Read / Write | I | N/A | R/W signal is a synchronous input that identifies whether the current load cycle initiated is a Read or Write access to the memory array. The data bus activity for the current cycle takes place one clock cycle later. |
| CEN | Clock Enable | I | LOW | Synchronous Clock Enable Input. When CEN is sampled high, all other synchronous inputs, including clock are ignored and outputs remain unchanged. The effect of CEN sampled high on the device outputs is as if the low to high clock transition did not occur. For normal operation, CEN must be sampled low at rising edge of clock. |
| BW ₁ -BW ₄ | Individual Byte Write Enables | I | LOW | Synchronous byte write enables. Each 9-bit byte has its own active low byte write enable. On load write cycles (When R/W and ADV/LD are sampled low) the appropriate byte write signal (BW ₁ -BW ₄) must be valid. The byte write signal must also be valid on each cycle of a burst write. Byte Write signals are ignored when R/W is sampled high. The appropriate byte(s) of data are written into the device one cycle later. BW ₁ -BW ₄ can all be tied low if always doing write to the entire 36-bit word. |
| CE ₁ , CE ₂ | Chip Enables | I | LOW | Synchronous active low chip enable. CE ₁ and CE ₂ are used with CE ₂ to enable the IDT71V65702/5902 (CE ₁ or CE ₂ sampled high or CE ₂ sampled low) and ADV/LD low at the rising edge of clock, initiates a deselect cycle. The ZBT™ has a one cycle deselect, i.e., the data bus will tri-state one clock cycle after deselect is initiated. |
| CE ₂ | Chip Enable | I | HIGH | Synchronous active high chip enable. CE ₂ is used with CE ₁ and CE ₂ to enable the chip. CE ₂ has inverted polarity but otherwise identical to CE ₁ and CE ₂ . |
| CLK | Clock | I | N/A | This is the clock input to the IDT71V65702/5902. Except for OE, all timing references for the device are made with respect to the rising edge of CLK. |
| I/O ₀ -I/O ₃₁ I/O _{P1} -I/O _{P4} | Data Input/Output | I/O | N/A | Data input/output (I/O) pins. The data input path is registered, triggered by the rising edge of CLK. The data output path is flow-through (no output register). |
| LBO | Linear Burst Order | I | LOW | Burst order selection input. When LBO is high the Interleaved burst sequence is selected. When LBO is low the Linear burst sequence is selected. LBO is a static input, and it must not change during device operation. |
| OE | Output Enable | I | LOW | Asynchronous output enable. OE must be low to read data from the 71V65702/5902. When OE is HIGH the I/O pins are in a high-impedance state. OE does not need to be actively controlled for read and write cycles. In normal operation, OE can be tied low. |
| TMS | Test Mode Select | I | N/A | Gives input command for TAP controller; sampled on rising edge of TCK. |
| TDI | Test Data Input | I | N/A | Serial input of registers placed between TDI and TDO. Sampled on rising edge of TCK. |
| TCK | Test Clock | I | N/A | Clock input of TAP controller. Each TAP event is clocked. Test inputs are captured on rising edge of TCK, while test outputs are driven from falling edge of TCK. |
| TDO | Test Data Output | O | N/A | Serial output of registers placed between TDI and TDO. This output is active depending on the state of the TAP controller. |
| ZZ | Sleep Mode | I | HIGH | Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71V65702/5902 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode. |
| V _{DD} | Power Supply | N/A | N/A | 3.3V core power supply. |
| V _{DDO} | Power Supply | N/A | N/A | 2.5V I/O supply. |
| V _{SS} | Ground | N/A | N/A | Ground. |

5315 tbl 02

NOTE:

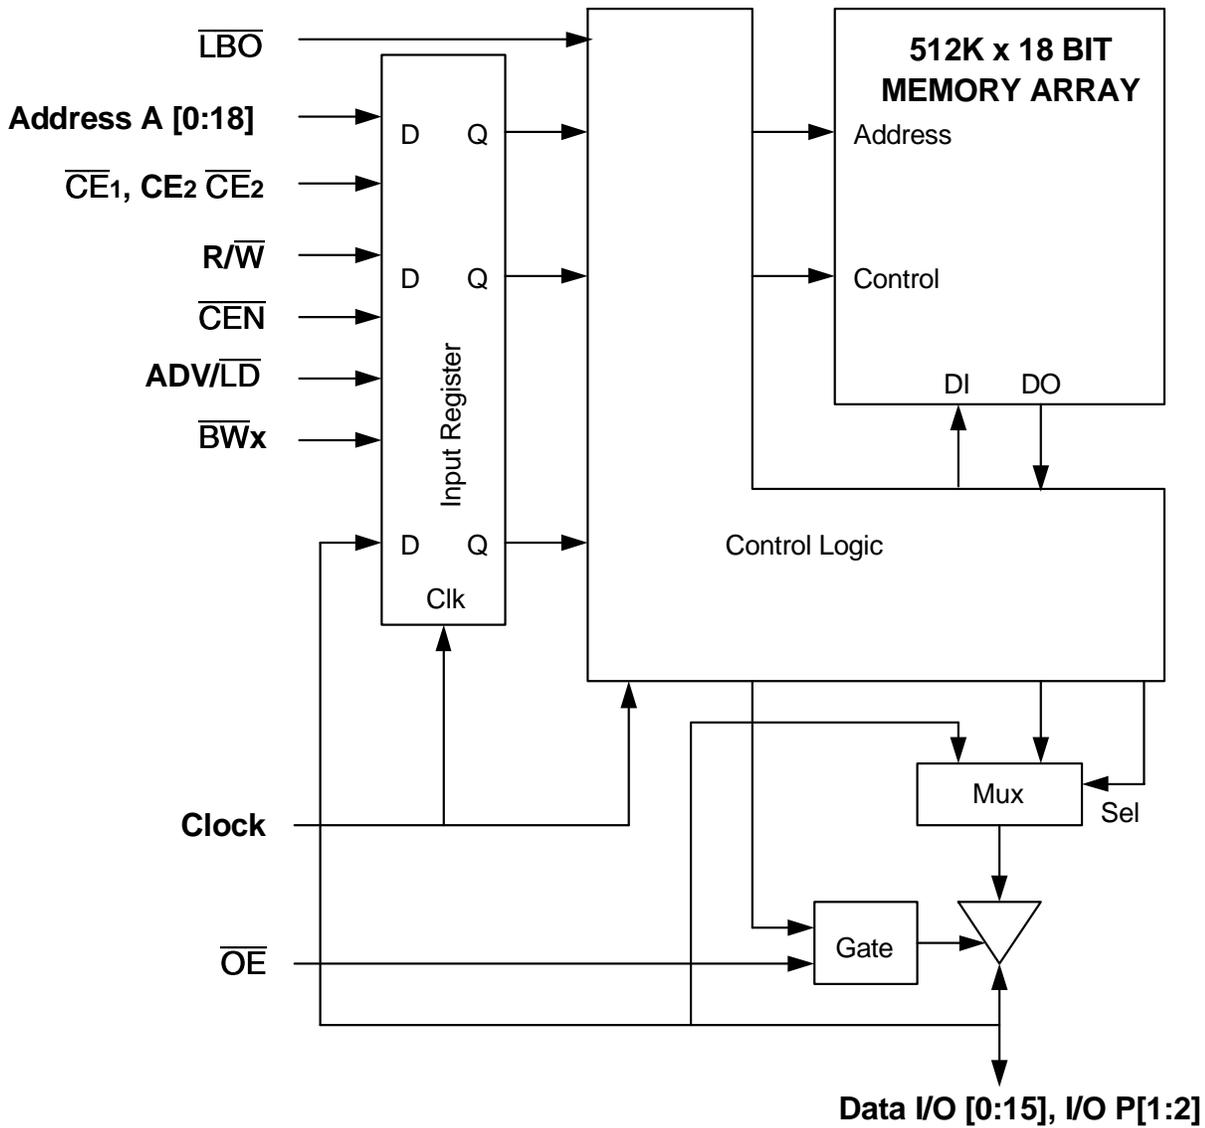

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

Recommended DC Operating Conditions

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|-----------|-----------------------------|---------------------|------|-----------------|------|
| V_{DD} | Core Supply Voltage | 3.135 | 3.3 | 3.465 | V |
| V_{DDQ} | I/O Supply Voltage | 2.375 | 2.5 | 2.625 | V |
| V_{SS} | Ground | 0 | 0 | 0 | V |
| V_{IH} | Input High Voltage - Inputs | 1.7 | — | $V_{DD} + 0.3$ | V |
| V_{IH} | Input High Voltage - I/O | 1.7 | — | $V_{DDQ} + 0.3$ | V |
| V_{IL} | Input Low Voltage | -0.3 ⁽¹⁾ | — | 0.7 | V |

5315 tbl 03

NOTE:

1. V_{IL} (min.) = -1.0V for pulse width less than $t_{cyc}/2$, once per cycle.

Recommended Operating Temperature and Supply Voltage

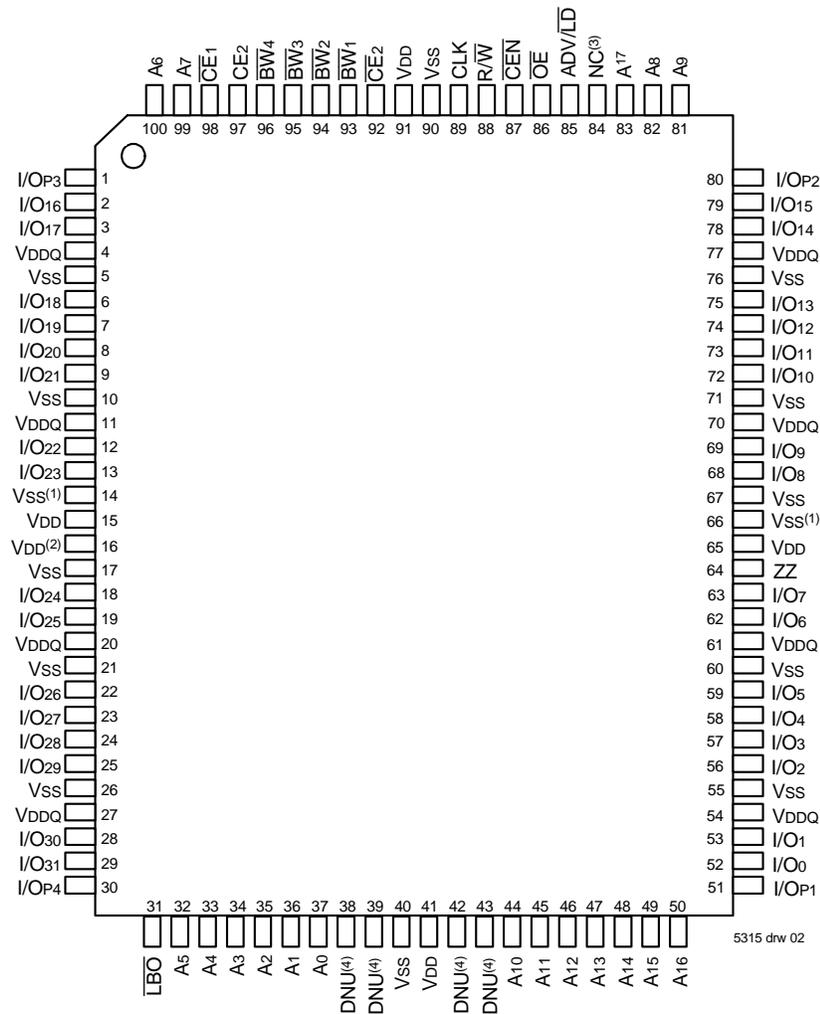

| Grade | Temperature ⁽¹⁾ | V _{SS} | V _{DD} | V _{DDQ} |
|------------|----------------------------|-----------------|-----------------|------------------|
| Commercial | 0°C to +70°C | 0V | 3.3V±5% | 2.5V±5% |

NOTES:

5315 tbl 05

1. T_A is the "instant on" case temperature.

Pin Configuration — 256K x 36

Top View 100 TQFP

NOTES:

1. Pins 14 and 66 do not have to be connected directly to V_{SS} as long as the input voltage is ≤ V_{IL}.
2. Pin 16 does not have to be connected directly to V_{DD} as long as the input voltage is ≥ V_{IH}.
3. Pins 84 is reserved for a future 16M.
4. DNU = Do not use. Pins 38, 39, 42 and 43 are reserved for respective JTAG pins: TMS, TDI, TDO and TCK. Within the current version these pins can be left unconnected, tied LOW (V_{SS}), or tied HIGH (V_{DD}).

NOTES:

1. Pins H1 and N7 do not have to be directly connected to Vss as long as the input voltage is $\leq V_{IL}$.
2. Pin H2 does not have to be connected directly to Vdd as long as the input voltage is $\geq V_{IH}$.
3. Pins B9, B11, A1, R2 and P2 are reserved for future 18M, 36M, 72M, 144 and 288M respectively.
4. DNU = Do not use. Pins P5, R5, P7, R7 and N5 are reserved for respective JTAG pins: TDI, TMS, TDO, TCK and \overline{TRST} on future revisions. Within the current version these pins can be left unconnected, tied LOW (Vss), or tied HIGH (Vdd).

Synchronous Truth Table⁽¹⁾

| \overline{CEN} | R/W | $\overline{CE1}, \overline{CE2}^{(6)}$ | ADV/LD | BWx | ADDRESS USED | PREVIOUS CYCLE | CURRENT CYCLE | I/O (One cycle later) |
|------------------|-----|--|--------|-------|--------------|--------------------------|--|-----------------------|
| L | L | L | L | Valid | External | X | LOAD WRITE | D ⁽⁷⁾ |
| L | H | L | L | X | External | X | LOAD READ | Q ⁽⁷⁾ |
| L | X | X | H | Valid | Internal | LOAD WRITE / BURST WRITE | BURST WRITE (Advance burst counter) ⁽²⁾ | D ⁽⁷⁾ |
| L | X | X | H | X | Internal | LOAD READ / BURST READ | BURST READ (Advance burst counter) ⁽²⁾ | Q ⁽⁷⁾ |
| L | X | H | L | X | X | X | DESELECT or STOP ⁽³⁾ | HIZ |
| L | X | X | H | X | X | DESELECT / NOOP | NOOP | HIZ |
| H | X | X | X | X | X | X | SUSPEND ⁽⁴⁾ | Previous Value |

5315 tbl 08

NOTES:

- L = V_{IL}, H = V_{IH}, X = Don't Care.
- When ADV/LD signal is sampled high, the internal burst counter is incremented. The R/W signal is ignored when the counter is advanced. Therefore the nature of the burst cycle (Read or Write) is determined by the status of the R/W signal when the first address is loaded at the beginning of the burst cycle.
- Deselect cycle is initiated when either $\overline{CE1}$, or $\overline{CE2}$ is sampled high or CE2 is sampled low) and ADV/LD is sampled low at rising edge of clock. The data bus will tri-state one cycle after deselect is initiated.
- When \overline{CEN} is sampled high at the rising edge of clock, that clock edge is blocked from propagating through the part. The state of all the internal registers and the I/Os remains unchanged.
- To select the chip requires $\overline{CE1} = L$, $\overline{CE2} = L$ and CE2 = H on these chip enable pins. The chip is deselected if any one of the chip enables is false.
- Device Outputs are ensured to be in High-Z during device power-up.
- Q - data read from the device, D - data written to the device.

Partial Truth Table for Writes⁽¹⁾

| OPERATION | R/W | $\overline{BW1}$ | $\overline{BW2}$ | $\overline{BW3}^{(3)}$ | $\overline{BW4}^{(3)}$ |
|---|-----|------------------|------------------|------------------------|------------------------|
| READ | H | X | X | X | X |
| WRITE ALL BYTES | L | L | L | L | L |
| WRITE BYTE 1 (I/O[0:7], I/OP1) ⁽²⁾ | L | L | H | H | H |
| WRITE BYTE 2 (I/O[8:15], I/OP2) ⁽²⁾ | L | H | L | H | H |
| WRITE BYTE 3 (I/O[16:23], I/OP3) ^(2,3) | L | H | H | L | H |
| WRITE BYTE 4 (I/O[24:31], I/OP4) ^(2,3) | L | H | H | H | L |
| NO WRITE | L | H | H | H | H |

5315 tbl 09

NOTES:

- L = V_{IL}, H = V_{IH}, X = Don't Care.
- Multiple bytes may be selected during the same cycle.
- N/A for x18 configuration.

Interleaved Burst Sequence Table ($\overline{LBO} = V_{DD}$)

| | Sequence 1 | | Sequence 2 | | Sequence 3 | | Sequence 4 | |
|-------------------------------|------------|----|------------|----|------------|----|------------|----|
| | A1 | A0 | A1 | A0 | A1 | A0 | A1 | A0 |
| First Address | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| Second Address | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 |
| Third Address | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| Fourth Address ⁽¹⁾ | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |

5315 tbl 10

NOTE:

- Upon completion of the Burst sequence the counter wraps around to its initial state and continues counting.

Linear Burst Sequence Table ($\overline{LBO}=V_{SS}$)

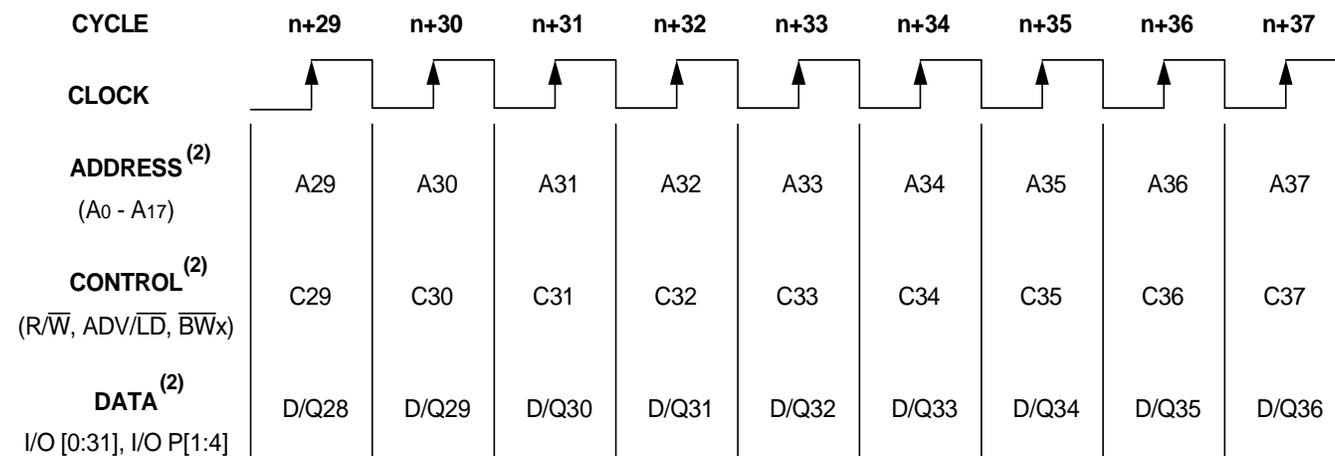

| | Sequence 1 | | Sequence 2 | | Sequence 3 | | Sequence 4 | |
|-------------------------------|------------|----|------------|----|------------|----|------------|----|
| | A1 | A0 | A1 | A0 | A1 | A0 | A1 | A0 |
| First Address | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 1 |
| Second Address | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 0 |
| Third Address | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 |
| Fourth Address ⁽¹⁾ | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 |

5315 tbl 11

NOTE:

1. Upon completion of the Burst sequence the counter wraps around to its initial state and continues counting.

Functional Timing Diagram⁽¹⁾

5315 drw 03

NOTES:

1. This assumes \overline{CEN} , $\overline{CE1}$, $CE2$ and $\overline{CE2}$ are all true.
2. All Address, Control and Data_In are only required to meet set-up and hold time with respect to the rising edge of clock. Data_Out is valid after a clock-to-data delay from the rising edge of clock.

Device Operation - Showing Mixed Load, Burst, Deselect and NOOP Cycles⁽²⁾

| Cycle | Address | R/ \bar{W} | ADV/ \bar{LD} | $\bar{CE}_1^{(1)}$ | \bar{CEN} | \bar{BW}_x | \bar{OE} | I/O | Comments |
|-------|----------------|--------------|-----------------|--------------------|-------------|--------------|------------|------------------|------------------|
| n | A ₀ | H | L | L | L | X | X | D ₁ | Load read |
| n+1 | X | X | H | X | L | X | L | Q ₀ | Burst read |
| n+2 | A ₁ | H | L | L | L | X | L | Q ₀₊₁ | Load read |

5315 tbl 20

NOTES:

1. H = High; L = Low; X = Don't Care; ? = Don't Know; Z = High Impedance.
2. $\overline{CE} = L$ is defined as $\overline{CE}_1 = L$, $\overline{CE}_2 = L$ and CE₂ = H. $\overline{CE} = H$ is defined as $\overline{CE}_1 = H$, $\overline{CE}_2 = H$ or CE₂ = L.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (V_{DD} = 3.3V±5%)

| Symbol | Parameter | Test Conditions | Min. | Max. | Unit |
|-----------------|--|---|------|------|------|
| I _{LI} | Input Leakage Current | V _{DD} = Max., V _{IN} = 0V to V _{DD} | — | 5 | μA |
| I _L | $\overline{\text{LBO}}$ Input Leakage Current ⁽¹⁾ | V _{DD} = Max., V _{IN} = 0V to V _{DD} | — | 30 | μA |
| I _{LO} | Output Leakage Current | V _{OUT} = 0V to V _{CC} | — | 5 | μA |
| V _{OL} | Output Low Voltage | I _{OL} = +6mA, V _{DD} = Min. | — | 0.4 | V |
| V _{OH} | Output High Voltage | I _{OH} = -6mA, V _{DD} = Min. | 2.0 | — | V |

NOTE:

5001 tbl 21

1. The $\overline{\text{LBO}}$ pin will be internally pulled to V_{DD} if it is not actively driven in the application and the ZZ pin will be internally pulled to V_{SS} if not actively driven.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range⁽¹⁾ (V_{DD} = 3.3V±5%)

| Symbol | Parameter | Test Conditions | 7.5ns | 8ns | 8.5ns | Unit |
|------------------|------------------------------------|---|-------|-----|-------|------|
| I _{DD} | Operating Power Supply Current | Device Selected, Outputs Open, ADV/LD = X, V _{DD} = Max., V _{IN} ≥ V _{IH} or ≤ V _{IL} , f = f _{MAX} ⁽²⁾ | 275 | 250 | 225 | mA |
| I _{SB1} | CMOS Standby Power Supply Current | Device Deselected, Outputs Open, V _{DD} = Max., V _{IN} ≥ V _{HD} or ≤ V _{LD} , f = 0 ^(2,3) | 40 | 40 | 40 | mA |
| I _{SB2} | Clock Running Power Supply Current | Device Deselected, Outputs Open, V _{DD} = Max., V _{IN} ≥ V _{HD} or ≤ V _{LD} , f = f _{MAX} ^(2,3) | 105 | 100 | 95 | mA |
| I _{SB3} | Idle Power Supply Current | Device Selected, Outputs Open, $\overline{\text{CEN}} \geq V_{IH}$, V _{DD} = Max., V _{IN} ≥ V _{HD} or ≤ V _{LD} , f = f _{MAX} ^(2,3) | 40 | 40 | 40 | mA |
| I _{ZZ} | Full Sleep Mode Supply Current | Device Selected, Outputs Open $\overline{\text{CEN}} \leq V_{IL}$, V _{DD} = Max., ZZ ≥ V _{HD} V _{IN} ≥ V _{HD} or ≤ V _{LD} , f = f _{MAX} ^(2,3) | 40 | 40 | 40 | mA |

NOTES:

5315 tbl 22

- All values are maximum guaranteed values.
- At f = f_{MAX}, inputs are cycling at the maximum frequency of read cycles of 1/t_{CYC}; f=0 means no input lines are changing.
- For I/Os V_{HD} = V_{DDQ} - 0.2V, V_{LD} = 0.2V. For other inputs V_{HD} = V_{DD} - 0.2V, V_{LD} = 0.2V.

AC Test Load

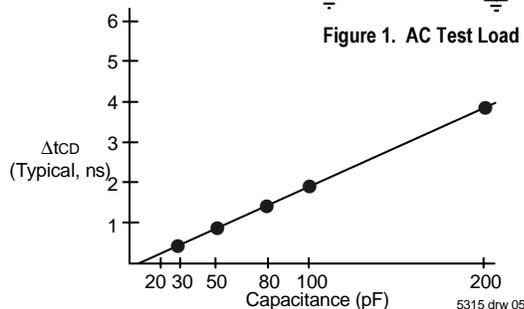

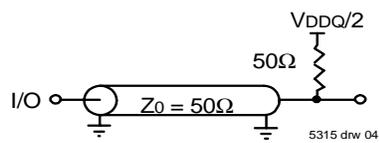

Figure 2. Lumped Capacitive Load, Typical Derating

AC Test Conditions

5315 tbl 24

NOTES:

1. Measured as HIGH above 0.6V_{DDQ} and LOW below 0.4V_{DDQ}.
2. Transition is measured ±200mV from steady-state.
3. These parameters are guaranteed with the AC load (Figure 1) by device characterization. They are not production tested.
4. To avoid bus contention, the output buffers are designed such that t_{CHZ} (device turn-off) is about 1ns faster than t_{CLZ} (device turn-on) at a given temperature and voltage. The specs as shown do not imply bus contention because t_{CLZ} is a Min. parameter that is worse case at totally different test conditions (0 deg. C, 3.465V) than t_{CHZ}, which is a Max. parameter (worse case at 70 deg. C, 3.135V).

Timing Waveform of Read Cycle(1,2,3,4)

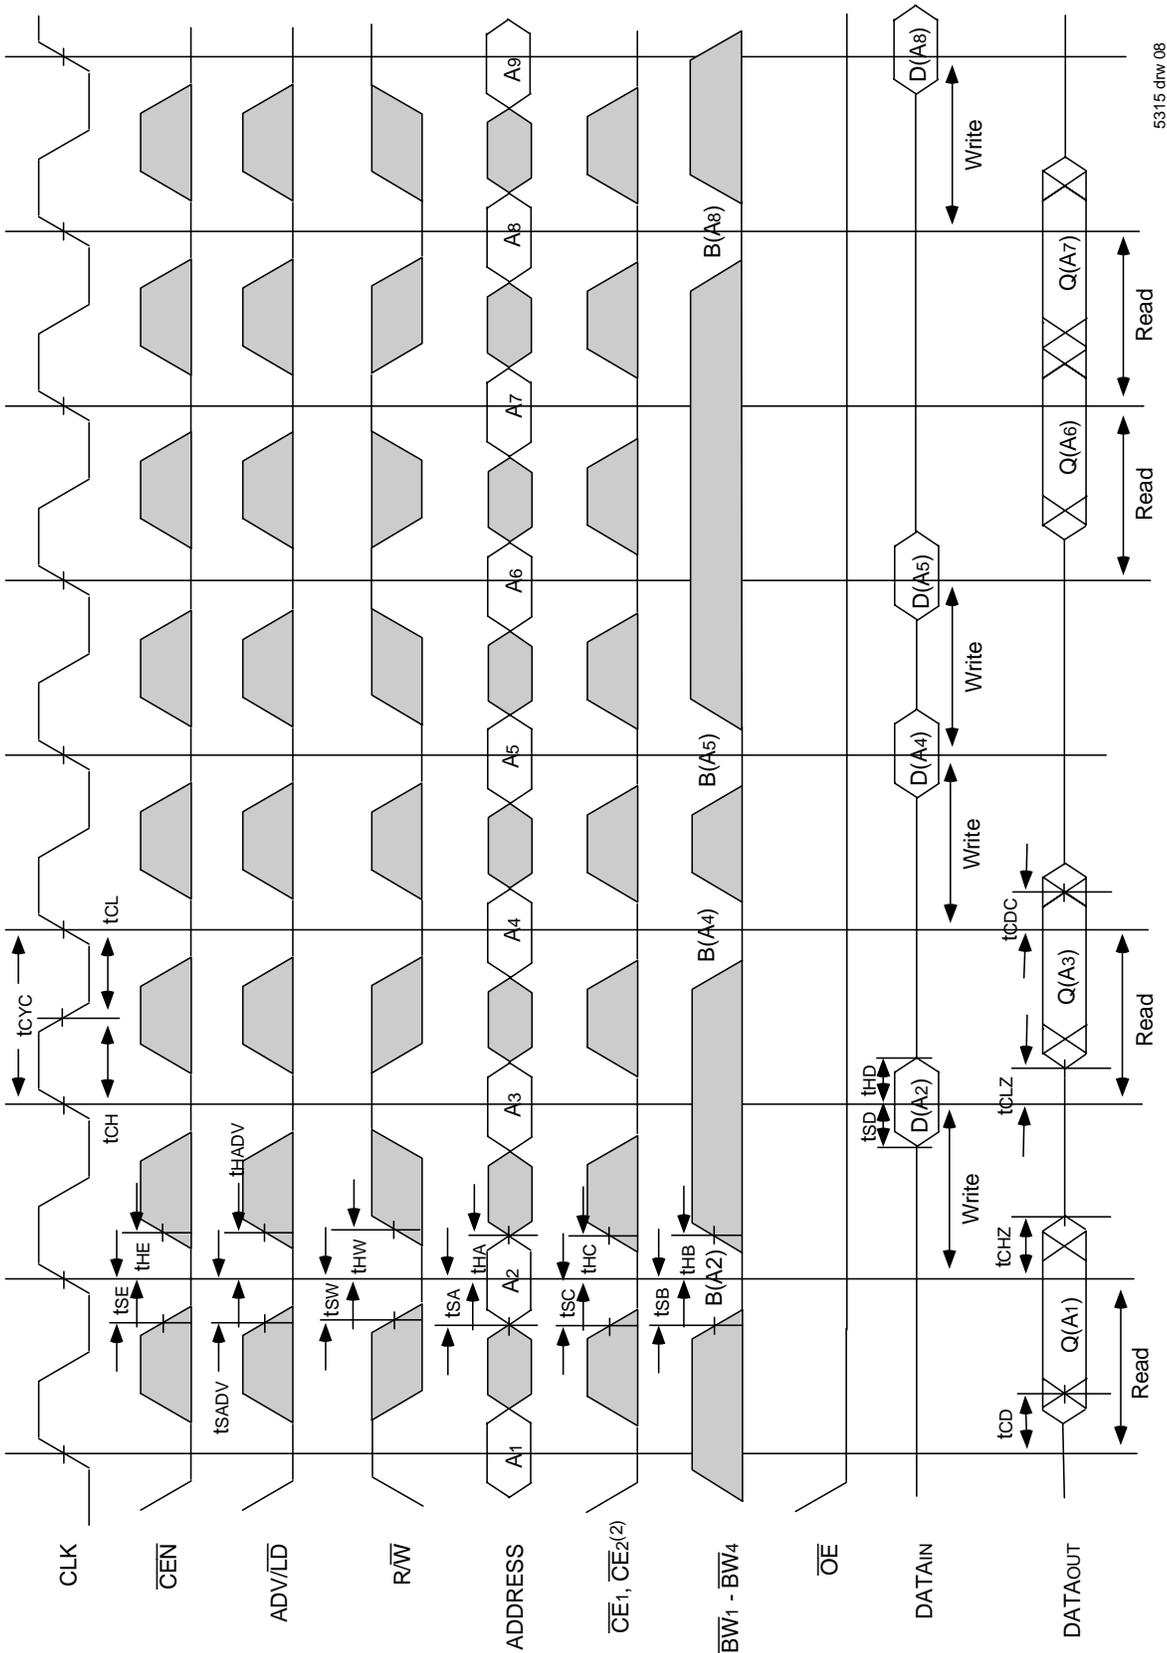

5315 drw 06

NOTES:

1. Q(A₁) represents the first output from the external address A₁. Q(A₂) represents the first output from the external address A₂; Q(A₂₊₁) represents the next output data in the burst sequence of the base address A₂, etc. where address bits A₀ and A₁ are advancing for the four word burst in the sequence defined by the state of the \overline{LBO} input.
2. CE₂ timing transitions are identical but inverted to the $\overline{CE_1}$ and $\overline{CE_2}$ signals. For example, when $\overline{CE_1}$ and $\overline{CE_2}$ are LOW on this waveform, CE₂ is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/LD LOW.
4. $\overline{R/W}$ is don't care when the SRAM is bursting (ADV/LD sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the $\overline{R/W}$ signal when new address and control are loaded into the SRAM.

Timing Waveform of Combined Read and Write Cycles(1,2,3)

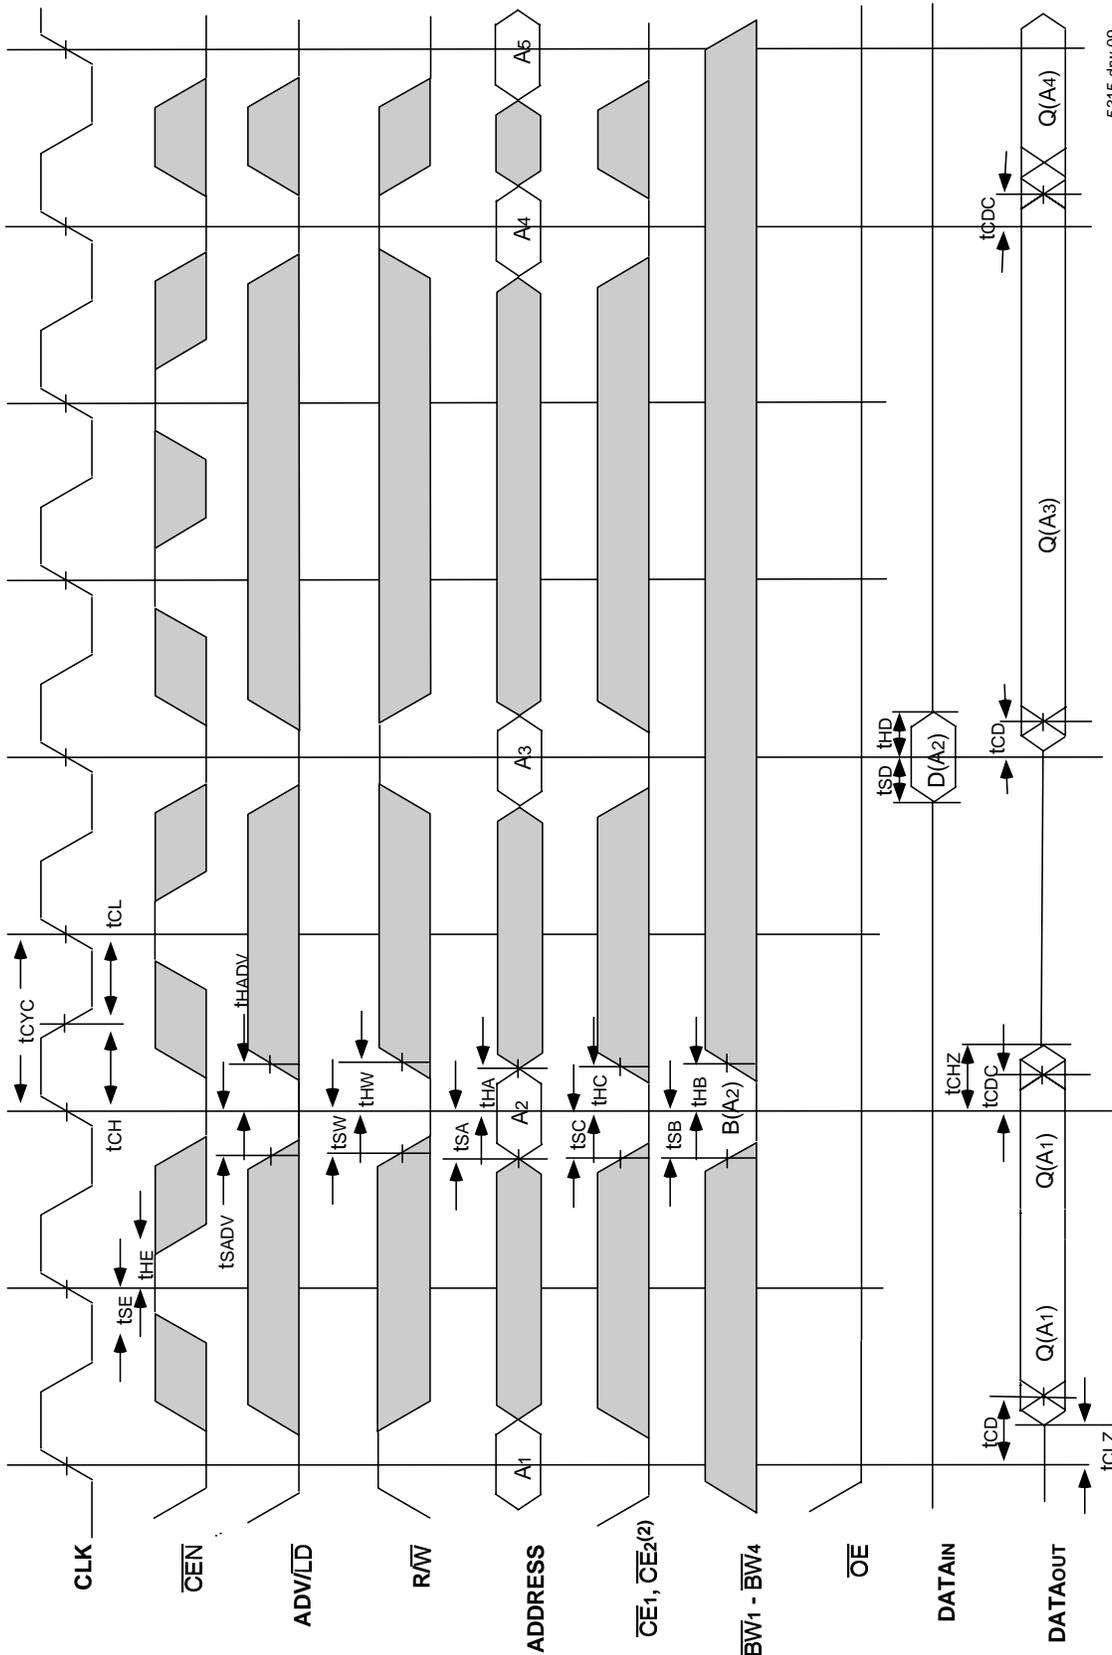

5315 drw 08

NOTES:

1. Q(A1) represents the first output from the external address A1. D(A2) represents the input data to the SRAM corresponding to address A2.
2. CE2 timing transitions are identical but inverted to the CE1 and CE2 signals. For example, when CE1 and CE2 are LOW on this waveform, CE2 is HIGH.
3. Individual Byte Write signals (BWx) must be valid on all write and burst-write cycles. A write cycle is initiated when RW signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

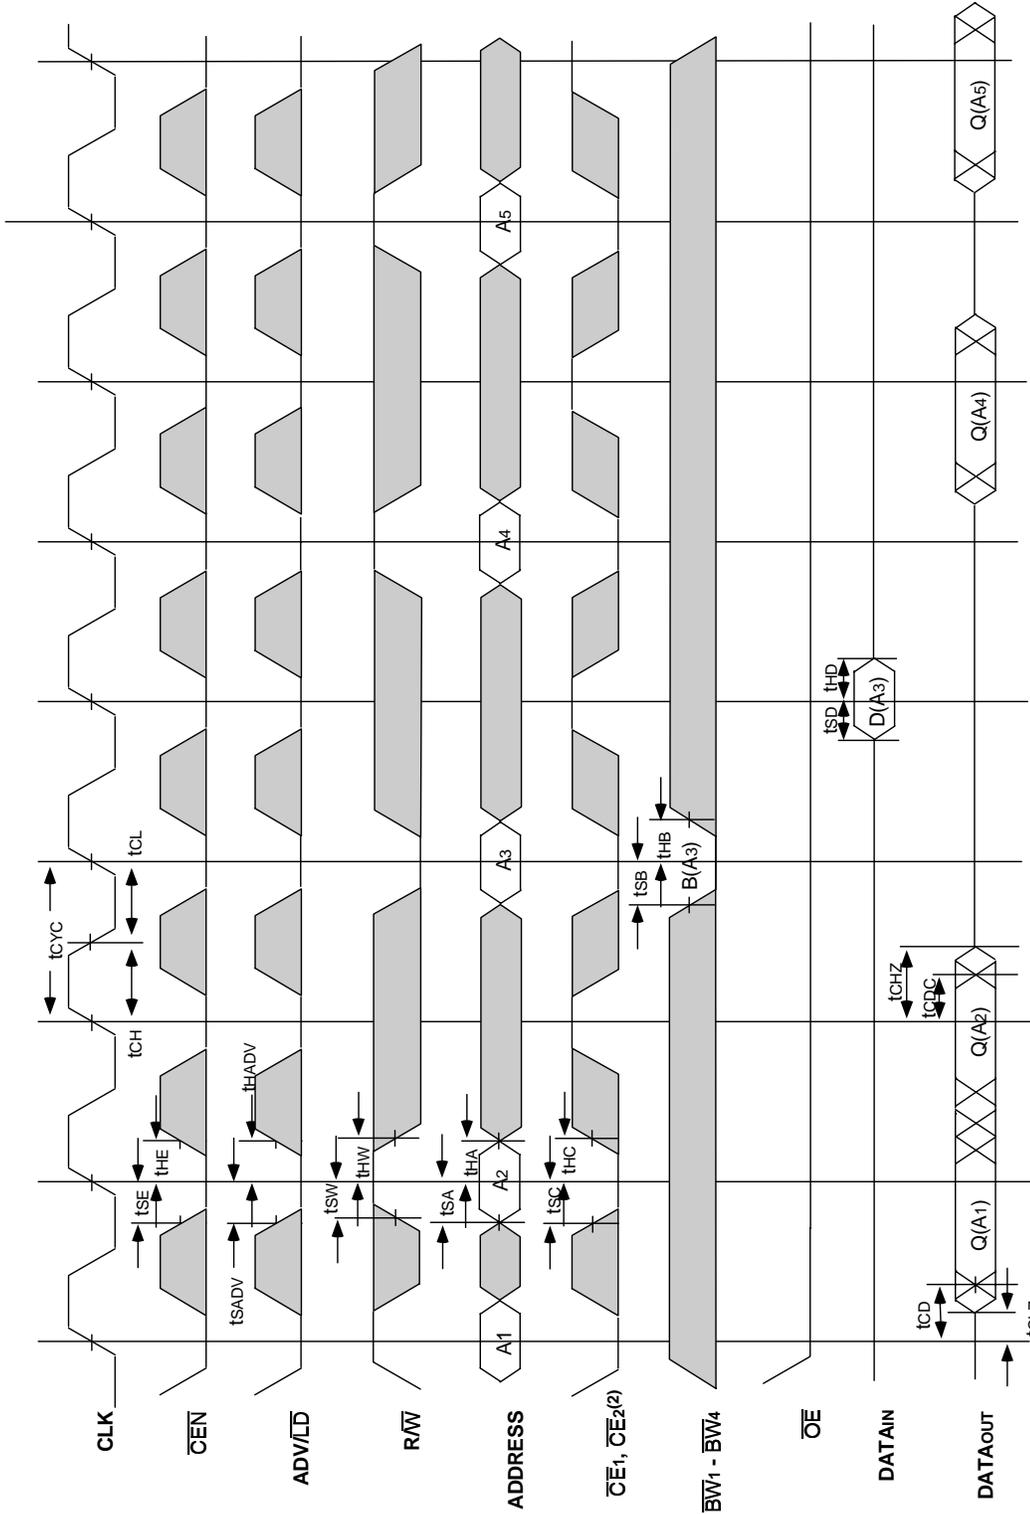

Timing Waveform of $\overline{\text{CEN}}$ Operation(1,2,3,4)

NOTES:

1. Q(A1) represents the first output from the external address A1. D(A2) represents the input data to the SRAM corresponding to address A2.
2. CEz timing transitions are identical but inverted to the $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ signals. For example, when $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ are LOW on this waveform, CEz is HIGH.
3. $\overline{\text{CEN}}$ when sampled high on the rising edge of clock will block that L-H transition of the clock from propagating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals ($\overline{\text{BWx}}$) must be valid on all write and burst-write cycles. A write cycle is initiated when $\overline{\text{RW}}$ signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

Timing Waveform of \overline{CS} Operation(1,2,3,4)

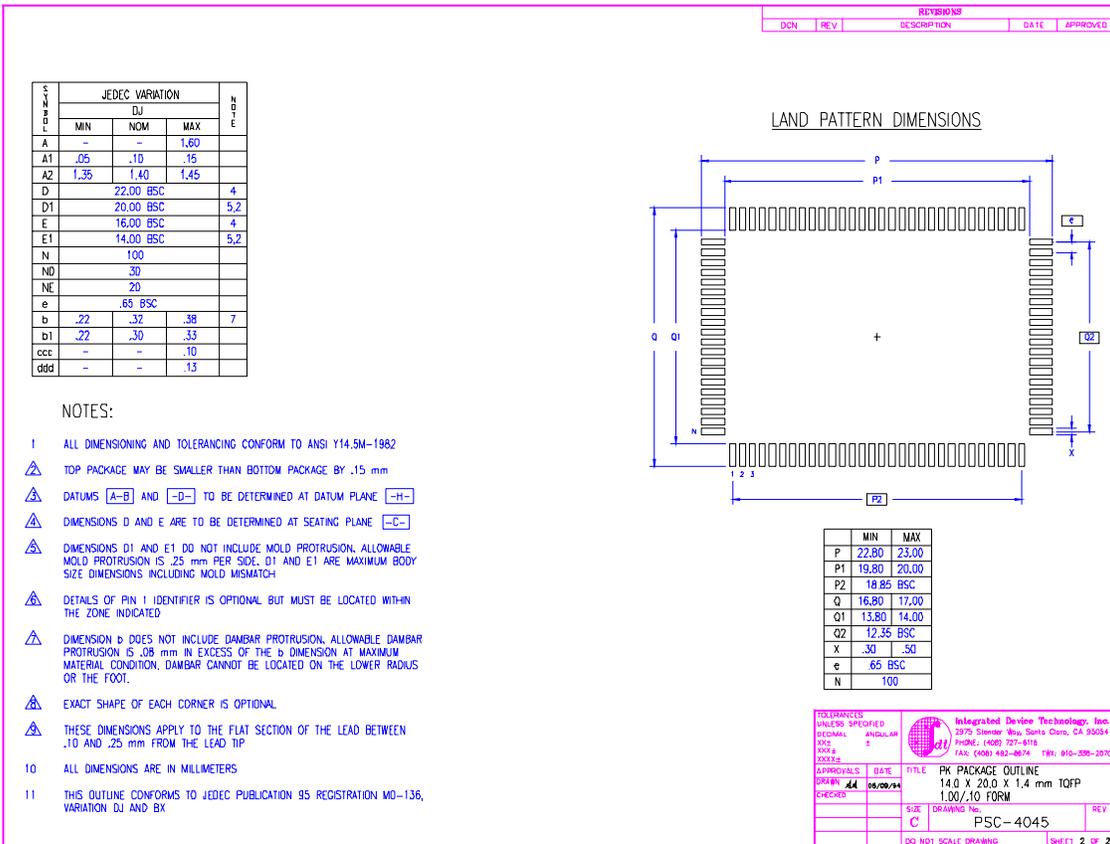

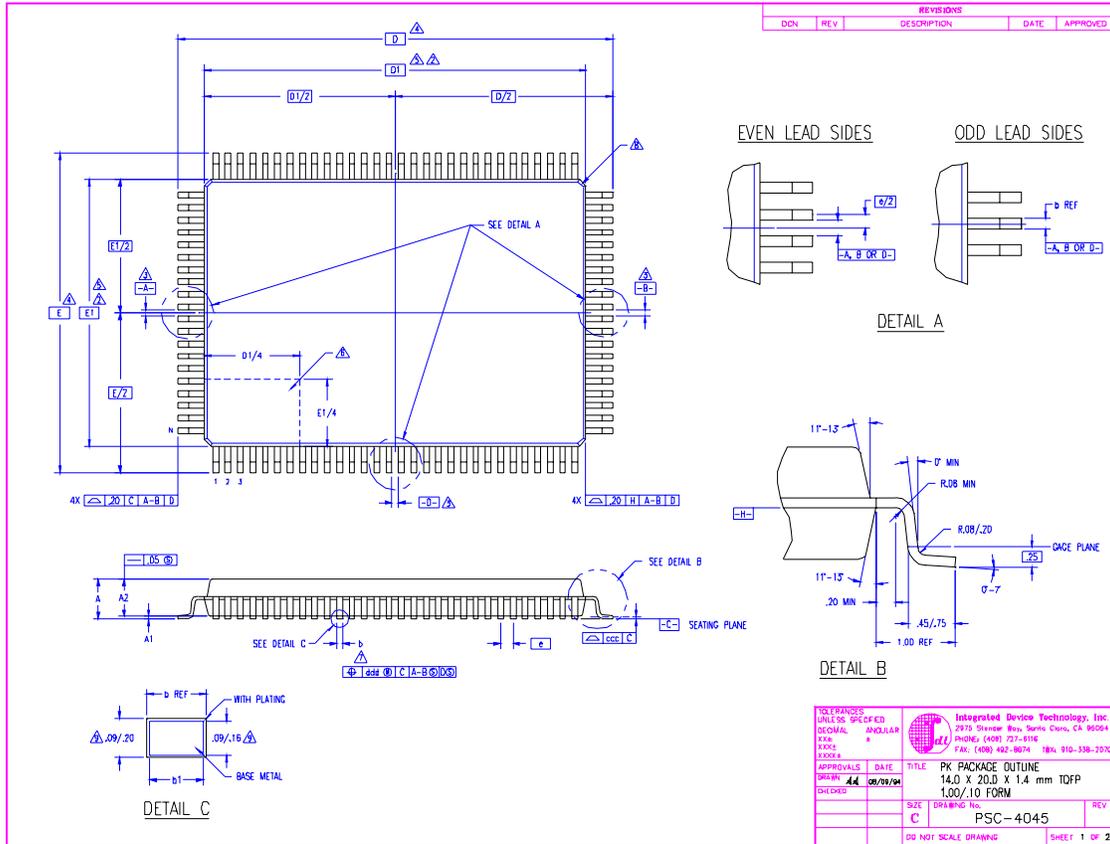

5315 draw 10

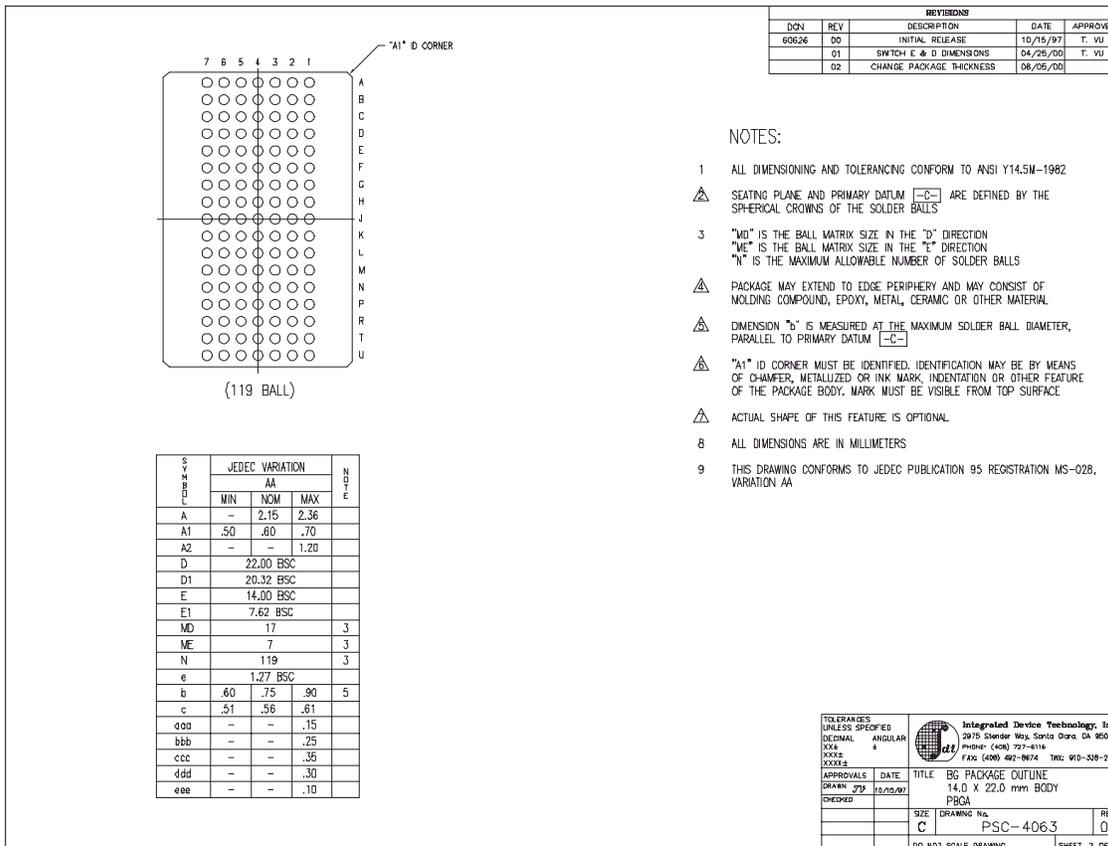

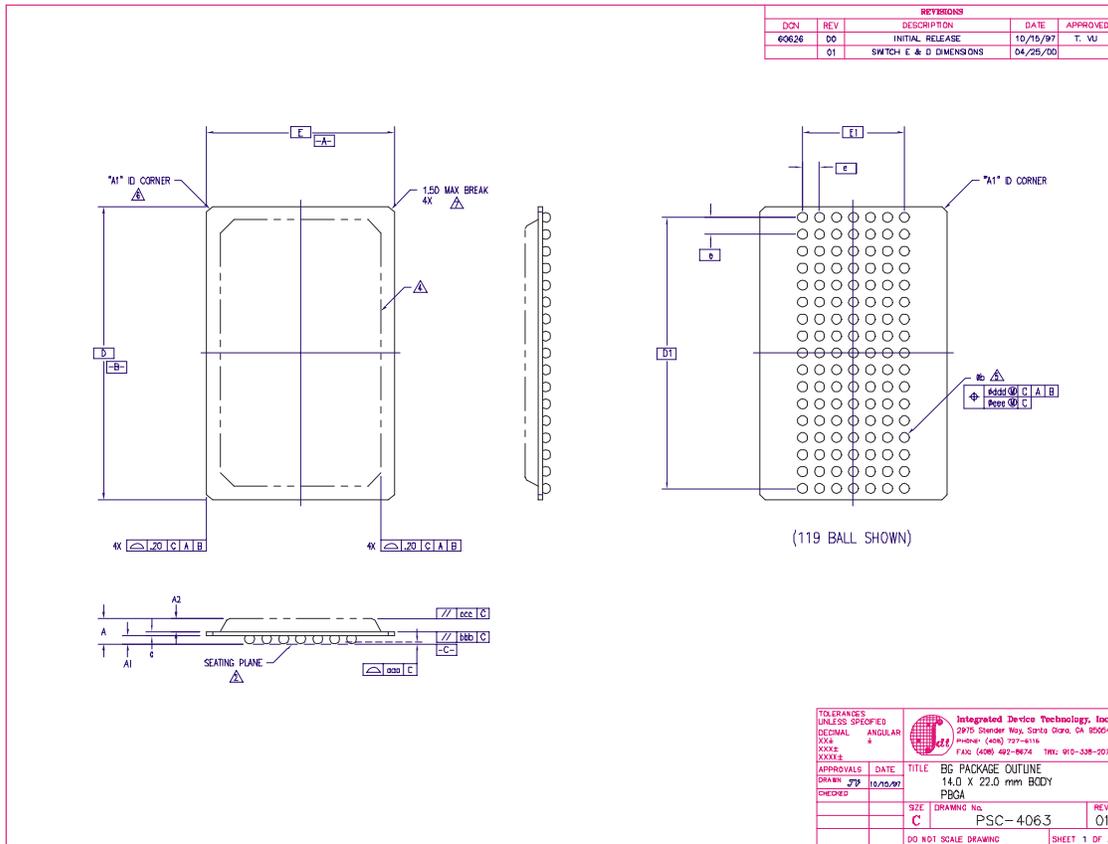

NOTES:

1. Q(A1) represents the first output from the external address A1. D(A3) represents the input data to the SRAM corresponding to address A3 etc.
2. CEz timing transitions are identical but inverted to the $\overline{CE1}$ and $\overline{CE2}$ signals. For example, when $\overline{CE1}$ and $\overline{CE2}$ are LOW on this waveform, $\overline{CE2}$ is HIGH.
3. When either one of the Chip enables ($\overline{CE1}$, $\overline{CE2}$) is sampled inactive at the rising clock edge, a deselect cycle is initiated. The data-bus tri-states one cycle after the initiation of the deselect cycle. This allows for any pending data transfers (reads or writes) to be completed.
4. Individual Byte Write signals (\overline{BWx}) must be valid on all write and burst-write cycles. A write cycle is initiated when \overline{RW} signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

- NOTES:
- ALL DIMENSIONING AND TOLERANCING CONFORM TO ASME Y14.5M-1994
 - "e" REPRESENTS THE BASIC SOLDER BALL GRID PITCH
 - "M" REPRESENTS THE MAXIMUM SOLDER BALL MATRIX SIZE
 - "N" REPRESENTS THE BALLCOUNT NUMBER
- DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER, PARALLEL TO PRIMARY DATUM
- SEATING PLANE AND PRIMARY DATUM ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS
- "A1" ID CORNER MUST BE IDENTIFIED BY CHAMFER, INK MARK, METALLIZED MARKING, INDENTATION OR OTHER FEATURE ON PACKAGE BODY
- IF "A1" ID CORNER IS ON PACKAGE BODY, IT MUST BE LOCATED WITHIN THE ZONE INDICATED
- ALL DIMENSIONS ARE IN MILLIMETERS

Datasheet Document History

| | | |
|----------|---------|--|
| 12/31/99 | | Created new datasheet from obsolete devices IDT71V657 and IDT71V659 |
| 04/20/00 | Pg.5,6 | Added JTAG test pins to TQFP pin configuration; removed footnote |
| | | Add clarification note to Recommended Operating Temperatures and Absolute MaxRating table |
| | Pg. 7 | Add note to BGA pin configuration; corrected typo within pinout |
| | Pg. 21 | Insert TQFP package Diagram Outline |
| 05/23/00 | | Added new package offering: 13mm x 15mm, 165 fBGA |
| | Pg. 23 | Correction on 119 BGA Package Diagram Outline |
| 07/28/00 | Pg. 5-8 | Remove JTAG pins from TQFP, BG119 and BQ165 pinouts refer to IDT71V656xx and IDT71V658xx Device errata sheet |
| | Pg. 7,8 | Correct error in pinout, B2 on BG119 and B1 on BQ165 pinout |
| | Pg. 23 | Update BG119 Package Diagram Dimensions |
| 11/04/00 | Pg. 8 | Add reference note to pin N5, BQ165 pinout, reserved for JTAG $\overline{\text{TRST}}$ |
| | Pg. 15 | Add Izz to DC Electrical Characteristics |
