

SN74ACT72211L, SN74ACT72221L, SN74ACT72231L, SN74ACT72241L 512 × 9, 1024 × 9, 2048 × 9, AND 4096 × 9 SYNCHRONOUS FIRST-IN, FIRST-OUT MEMORIES

SCAS222 – FEBRUARY 1993 – REVISED JUNE 1993

- Read and Write Clocks Can Be Asynchronous or Coincident
- Organization:
 - SN74ACT72211L – 512 × 9
 - SN74ACT72221L – 1024 × 9
 - SN74ACT72231L – 2048 × 9
 - SN74ACT72241L – 4096 × 9
- Write and Read Cycle Times of 15 ns
- Bit-Width Expandable
- Empty and Full Flags
- Programmable Almost-Empty and Almost-Full Flags With Default Offsets of Empty+7 and Full–7, Respectively
- TTL-Compatible Inputs
- Fully Compatible With the IDT72211/72221/72231/72241
- Available in 32-Pin Plastic J-Leaded Chip Carrier (RJ)

description

The SN74ACT72211L, SN74ACT72221L, SN74ACT72231L, and SN74ACT72241L are constructed with CMOS dual-port SRAM and are arranged as 512, 1024, 2048, and 4096 9-bit words, respectively. Internal write and read address counters provide data throughput on a first-in, first-out (FIFO) basis. Full and empty flags prevent memory overflow and underflow, and two programmable flags (almost full and almost empty) are provided.

The SN74ACT72211L, SN74ACT72221L, SN74ACT72231L, and SN74ACT72241L are synchronous FIFOs, which means the data input port and data output port each employ synchronous control. Write-enable ($\overline{WEN1}$, $WEN2/\overline{LD}$) signals allow the low-to-high transition of the write clock (WCLK) to store data in memory, and read-enable ($\overline{REN1}$, $\overline{REN2}$) signals allow the low-to-high transition of the read clock (RCLK) to read data from memory. WCLK and RCLK are independent of one another and can operate asynchronously or be tied together for single-clock operation.

The empty-flag (\overline{EF}) output is synchronized to RCLK and the full-flag (\overline{FF}) output is synchronized to WCLK to indicate absolute boundary conditions. Write operations are prohibited when \overline{FF} is low, and read operations are prohibited when \overline{EF} is low. Two programmable flags, programmable almost empty (\overline{PAE}) and programmable almost full (\overline{PAF}), can both be programmed to indicate any measure of memory fill. After reset, \overline{PAE} defaults to empty+7 and \overline{PAF} defaults to full–7. Flag-offset programming control is similar to a memory write with the use of the load ($WEN2/\overline{LD}$) signal.

These devices are suited for providing a data channel between two buses operating at asynchronous or synchronous rates. Applications include use as rate buffers for graphics systems and high-speed queues for communication systems. A 9-bit-wide data path is provided for the transmission of byte data plus a parity bit or packet-framing information.

The SN74ACT72211L, SN74ACT72221L, SN74ACT72231L, and SN74ACT72241L are characterized for operation from 0°C to 70°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
D0–D8	6–1, 32–30	I	Data inputs
\overline{EF}	14	O	Empty-flag. When memory is empty, \overline{EF} is low and further data reads are ignored by the device. When \overline{EF} is high, the memory is not empty and data reads are allowed. \overline{EF} is synchronized to RCLK by one flip-flop.
\overline{FF}	15	O	Full-flag. When memory is full, \overline{FF} is low and data writes are inhibited. \overline{FF} is synchronized to WCLK by one flip-flop.
GND	9		Ground
\overline{OE}	13	I	Output-enable. Q0–Q8 are in the high-impedance state when \overline{OE} is high. Q0–Q8 are active when \overline{OE} is low.
\overline{PAE}	8	O	Programmable almost-empty-flag. \overline{PAE} is low when the FIFO is almost empty based on the value in its offset register. The default value for the register is empty + 7. \overline{PAE} is synchronized to RCLK by one flip-flop.
\overline{PAF}	7	O	Programmable almost-full-flag. \overline{PAF} is low when the FIFO is almost full based on the value in its offset register. The default value for the register is full – 7. \overline{PAF} is synchronized to WCLK by one flip-flop.
Q0–Q8	16–24	O	Data outputs
RCLK	11	I	Read-clock. A data read is performed by the low-to-high transition of RCLK when $\overline{REN1}$ and $\overline{REN2}$ are asserted and \overline{EF} is high.
$\overline{REN1}$, $\overline{REN2}$	10, 11	I	Read-enable. Data is read from the FIFO on a low-to-high transition of RCLK when $\overline{REN1}$ and $\overline{REN2}$ are low and \overline{EF} is high.
\overline{RS}	29	I	Reset. When \overline{RS} is set low, the read and write pointers are initialized to the first RAM location and the FIFO is empty. \overline{FF} and \overline{PAF} are set high, and \overline{EF} and \overline{PAE} are set low. Each bit in the data output register is set low by a device reset. The FIFO must be reset after power up before data is written.
V_{CC}			Supply voltage
WCLK	27	I	Write-clock. Data is written by the low-to-high transition of WCLK when $\overline{WEN1}$ and $\overline{WEN2/LD}$ are asserted and \overline{FF} is high.
$\overline{WEN1}$	28	I	Write-enable 1. $\overline{WEN1}$ is the only write enable terminal if the device is configured to have programmable flags. Data is written on a low-to-high transition of WCLK when $\overline{WEN1}$ is low and \overline{FF} is high. If the FIFO is not configured for programmable flags, data is written on a low-to-high transition of WCLK when $\overline{WEN1}$ and $\overline{WEN2}$ are asserted and \overline{FF} is high.
$\overline{WEN2/LD}$	26	I	Write-enable 2/load. This is a dual-purpose input. The FIFO can have either two write enables or programmable flags. To use $\overline{WEN2/LD}$ as a $\overline{WEN2}$, $\overline{WEN2/LD}$ must be held high at reset. When $\overline{WEN2}$ and $\overline{WEN1}$ are asserted and \overline{FF} is high, a low-to-high transition of WCLK writes data. To use $\overline{WEN2/LD}$ as the \overline{LD} terminal, it must be held low at reset. In this case, \overline{LD} is asserted low to write or read the programmable offset registers.

detailed description

device reset

A reset is performed by taking the reset (\overline{RS}) input low. This initializes both the write and read pointers to the first memory location. After a reset, the full flag (\overline{FF}) and programmable almost-full flag (\overline{PAF}) are high and the empty flag (\overline{EF}) and programmable almost-empty flag (\overline{PAE}) are low. Each bit in the data output register (Q0–Q8) is set low, and the flag offset registers are loaded with the default offset values. A FIFO must be reset after power up before a write cycle is allowed.

The logic level on the dual-purpose input write enable 2/load ($WEN2/\overline{LD}$) during reset determines its function. If $WEN2/\overline{LD}$ is high when \overline{RS} returns high at the end of the reset cycle, the input is a second write enable (see FIFO writes and reads) and the programmable flags (\overline{PAF} , \overline{PAE}) can only use the default values. If $WEN2/\overline{LD}$ is low when \overline{RS} returns high at the end of the reset cycle, the input is the load (\overline{LD}) enable for writing and reading flag offset registers (see flag programming).

FIFO writes and reads

Data is written to memory by a low-to-high transition of write clock (WCLK) when write enable 1 ($\overline{WEN1}$) is low, $WEN2/\overline{LD}$ is high, and \overline{FF} is high. This stores D0–D8 data in the dual-port SRAM and increments the write pointer.

If no reads are performed after reset ($\overline{RS} = V_{IL}$), \overline{FF} is set low upon the completion of 512 writes to the SN74ACT72211, 1024 writes to the SN74ACT72221, 2048 writes to the SN74ACT72231, and 4096 writes to the SN74ACT72241. Attempted write cycles are ignored when \overline{FF} is low. \overline{FF} is set high by the first low-to-high transition of WCLK after data is read from a full FIFO. \overline{FF} and \overline{PAF} are each synchronized to the low-to-high transition of WCLK by one flip-flop.

If a device is configured to have two write enables (see device reset), data is read by the low-to-high transition of read clock (RCLK) when both read enables ($\overline{REN1}$, $\overline{REN2}$) are low and \overline{EF} is high. $WEN2/\overline{LD}$ must also be high if the device is configured to have programmable flags. A read from the FIFO puts RAM data on Q0–Q8 and increments the read pointer in the same sequence as the write pointer. New data is not shifted to the output register while either one or both of the read enables are high.

\overline{EF} and \overline{PAE} are each synchronized to the low-to-high transition of RCLK by one flip-flop. When the device is empty, the write and read pointers are equal and \overline{EF} is set low. Attempted read cycles are ignored while \overline{EF} is set low. \overline{EF} is set high by the first low-to-high transition of RCLK after data is written to an empty FIFO.

WCLK and RCLK can be asynchronous or coincident to one another. Writing data to FIFO memory is independent of reading data from FIFO memory and vice versa.

flag programming

When $WEN2/\overline{LD}$ is held low during a device reset ($\overline{RS} = V_{IL}$), the input is the load (\overline{LD}) enable for flag offset programming. In this configuration, $WEN2/\overline{LD}$ can be used to access the four 8-bit offset registers contained in the SN74ACT72211L/-72221L/-72231L/-72241L for writing or reading data.

When the device is configured for programmable flags and both $WEN2/\overline{LD}$ and $\overline{WEN1}$ are low, the first low-to-high transition of WCLK writes data from the data inputs to the empty offset least significant bit (LSB) register. The second, third, and fourth low-to-high transitions of WCLK store data in the empty offset most significant bit (MSB) register, full offset LSB register, and full offset MSB register, respectively, when $WEN2/\overline{LD}$ and $\overline{WEN1}$ are low. The fifth low-to-high transition of WCLK while $WEN2/\overline{LD}$ and $\overline{WEN1}$ are low writes data to the empty LSB register again. Figure 1 shows the register sizes and default values for the various device types.

It is not necessary to write to all the offset registers at one time. A subset of the offset registers can be written; then, by bringing the $WEN2/\overline{LD}$ input high, the FIFO is returned to normal read and write operation. The next time $WEN2/\overline{LD}$ is brought low, a write operation stores data in the next offset register in sequence.

flag programming (continued)

The contents of the offset registers can be read to the data outputs when $\overline{WEN2}/\overline{LD}$ is low and both $\overline{REN1}$ and $\overline{REN2}$ are low. Low-to-high transitions of RCLK read the register contents to the data outputs. Writes and reads should not be performed simultaneously on the offset registers (see Figure 1 and Table 1).

Figure 1. Offset Register Location and Default Values

flag programming (continued)

Table 1. Writing the Offset Registers

LD	WEN1	WCLK†	SELECTION
0	0	↑	Empty offset (LSB) ← Empty offset (MSB) Full offset (LSB) Full offset (MSB) →
0	1	↑	No operation
1	0	↑	Write into FIFO
1	1	↑	No operation

† The same selection sequence applies to reading from the registers. REN1 and REN2 are enabled and a read is performed on the low-to-high transition of RCLK.

programmable flag (PAE, PAF) operation

Whether the flag offset registers are programmed as described in Table 1 or the default values are used, the programmable almost-empty flag (PAE) and programmable almost-full flag (PAF) states are determined by their corresponding offset registers and the difference between the read and write pointers.

The number formed by the empty offset least significant bit register and empty offset most significant bit register is referred to as *n* and determines the operation of PAE. PAE is synchronized to the low-to-high transition of RCLK by one flip-flop and is low when the FIFO contains *n* or fewer unread words. PAE is set high by the low-to-high transition of RCLK when the FIFO contains (*n* + 1) or greater unread words.

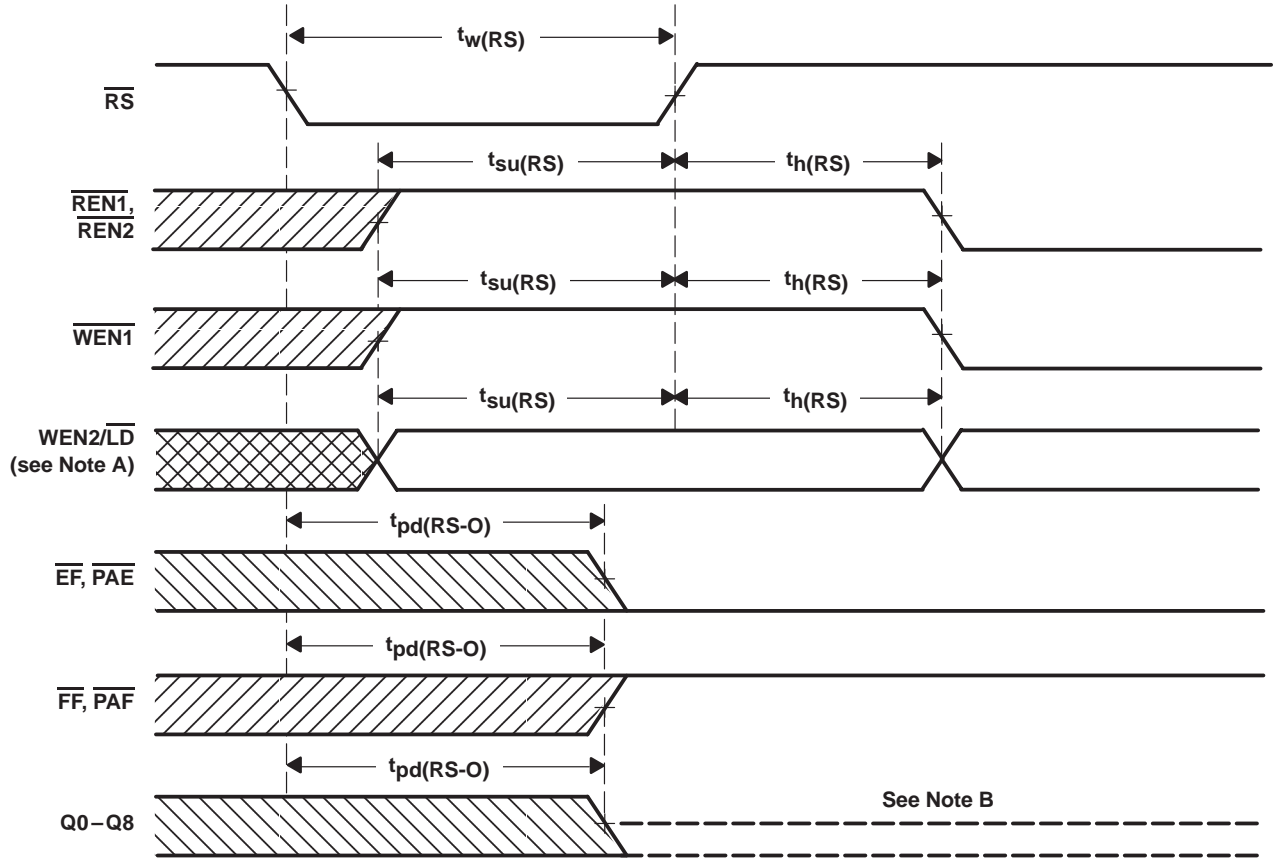

The number formed by the full offset least significant bit register and full offset most significant bit register is referred to as *m* and determines the operation of PAF. PAF is synchronized to the low-to-high transition of WCLK by one flip-flop and is set low when the number of unread words in the FIFO is greater than or equal to (512 – *m*) for the SN74ACT72211L, (1024 – *m*) for the SN74ACT72221L, (2048 – *m*) for the SN74ACT72231L, and (4096 – *m*) for the SN74ACT72241L. PAF is set high by the low-to-high transition of WCLK when the number of available memory locations is greater than *m* (see Table 2).

Table 2. Status Flags

NUMBER OF WORDS IN FIFO				OUTPUTS			
SN74ACT72211L	SN74ACT72221L	SN74ACT72231L	SN74ACT72241L	FF	PAF	PAE	EF
0	0	0	0	H	H	L	L
1 to <i>n</i> †	1 to <i>n</i> †	1 to <i>n</i> †	1 to <i>n</i> †	H	H	L	H
(<i>n</i> + 1) to [512 – (<i>m</i> + 1)]	(<i>n</i> + 1) to [1024 – (<i>m</i> + 1)]	(<i>n</i> + 1) to [2048 – (<i>m</i> + 1)]	(<i>n</i> + 1) to [4096 – (<i>m</i> + 1)]	H	H	H	H
(512 – <i>m</i>)‡ to 511	(1024 – <i>m</i>)‡ to 1023	(2048 – <i>m</i>)‡ to 2047	(4096 – <i>m</i>)‡ to 4095	H	L	H	H
512	1024	2048	4096	L	L	H	H

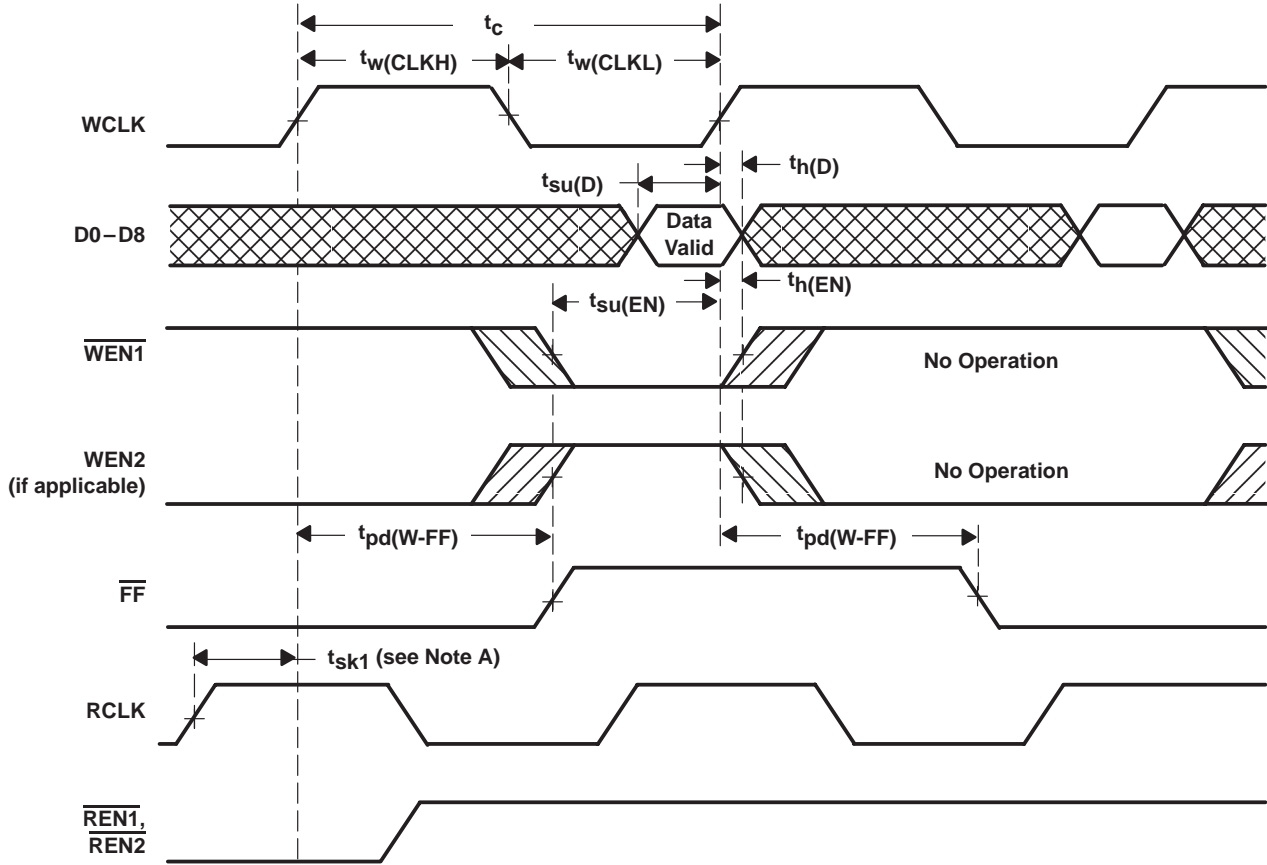

† *n* = empty offset (default value = 7)

‡ *m* = full offset (default value = 7)

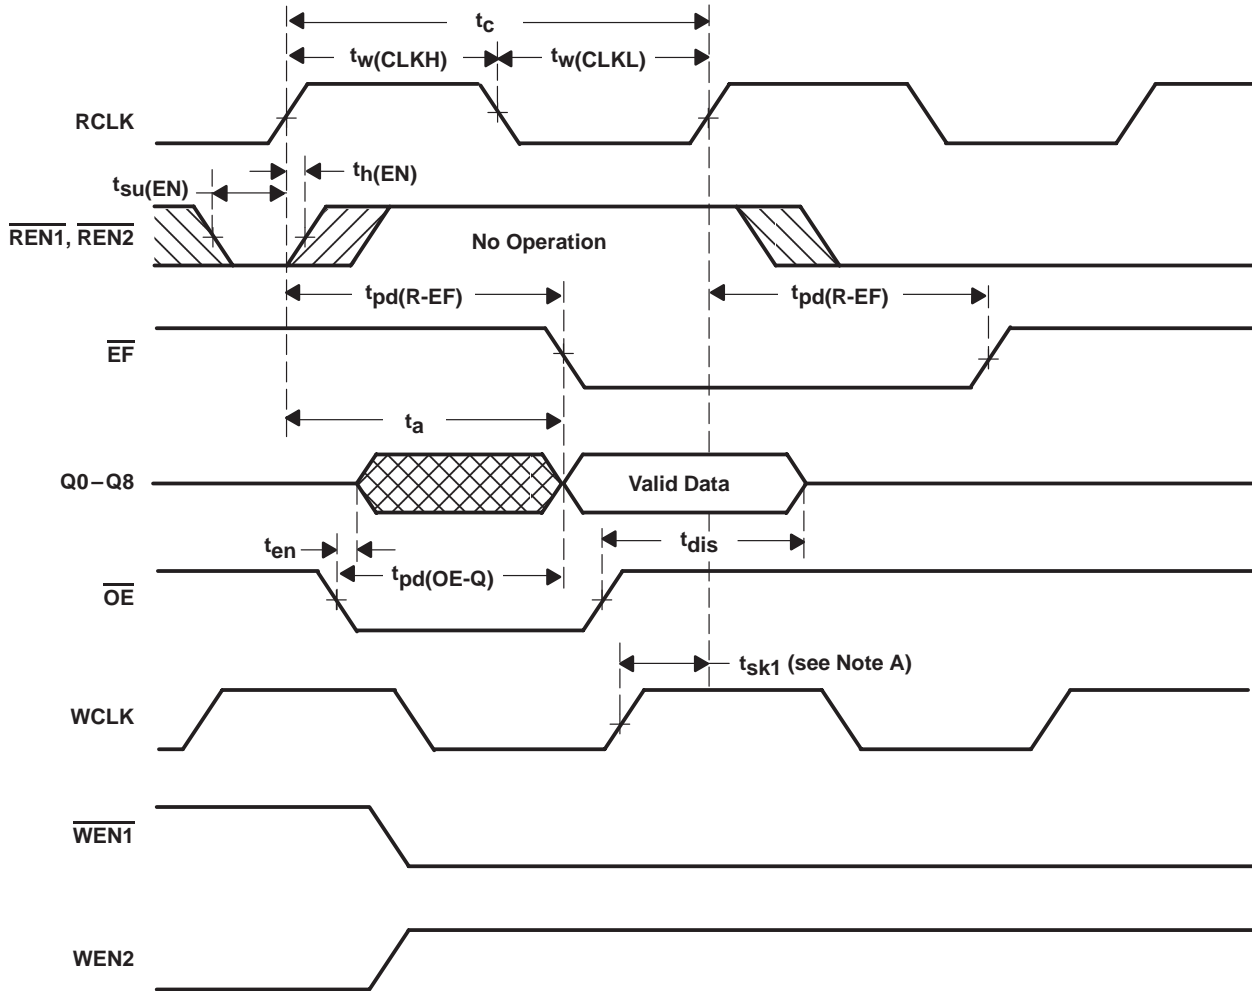

- NOTES: A. Holding $\overline{WEN2/LD}$ high during reset makes it act as a second write enable. Holding $\overline{WEN2/LD}$ low during reset makes it act as a load enable for the programmable flag offset registers.
 B. After reset, the outputs are low if \overline{OE} is low and at the high-impedance level if \overline{OE} is high.
 C. The clocks (RCLK, WCLK) can be free running during reset.

Figure 2. Reset Timing

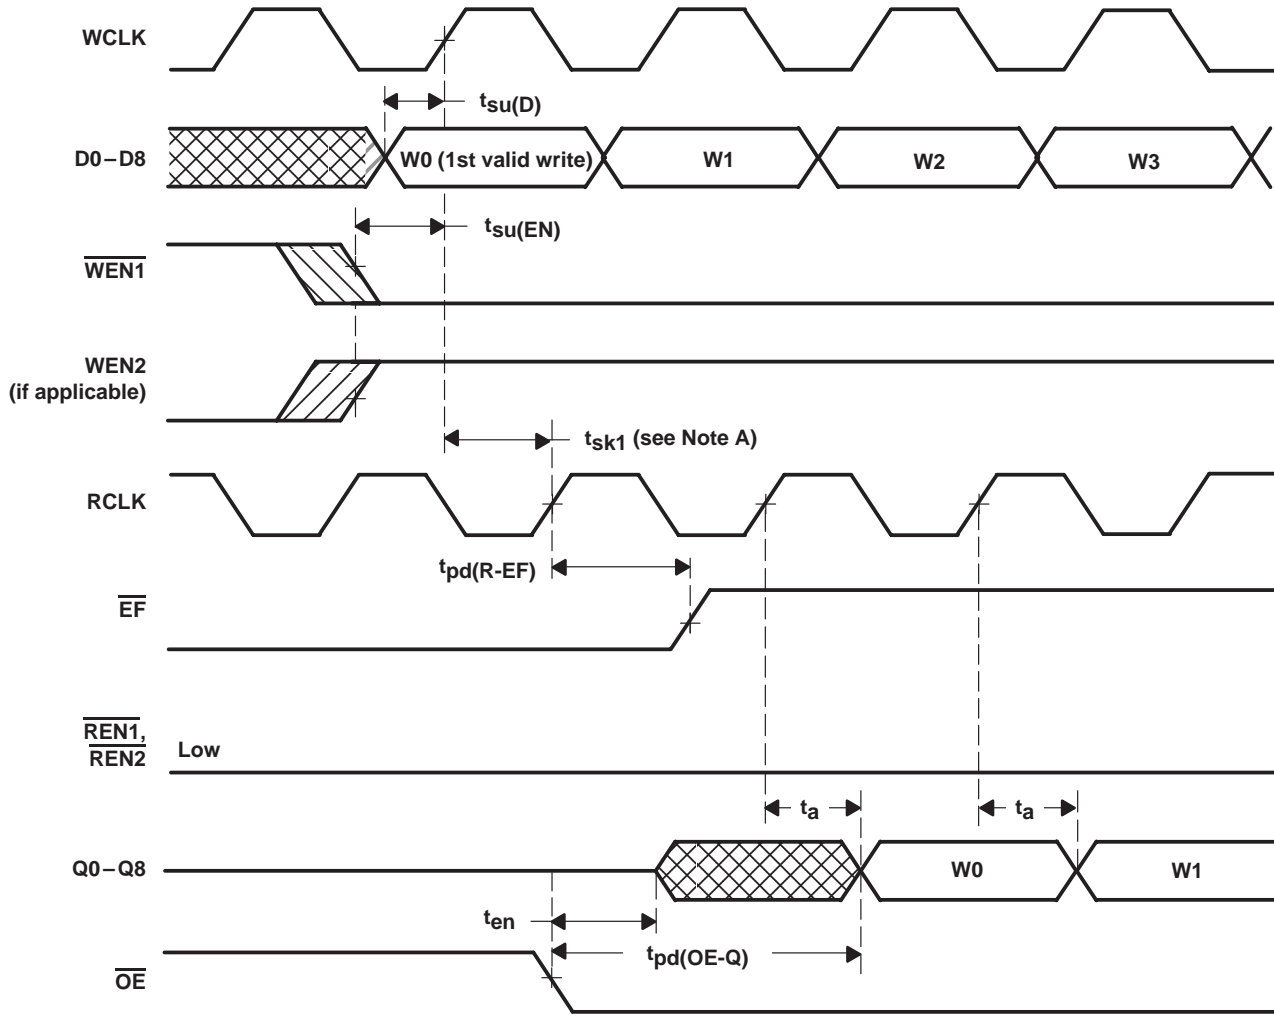

NOTE A: t_{sk1} is the minimum time between a rising RCLK edge and a subsequent rising WCLK edge for \overline{FF} to change logic levels during the current clock cycle. If the time between the rising edge of RCLK and the subsequent rising edge of WCLK is less than t_{sk1} , then \overline{FF} may not change its logic level until the next WCLK rising edge.

Figure 3. Write-Cycle Timing

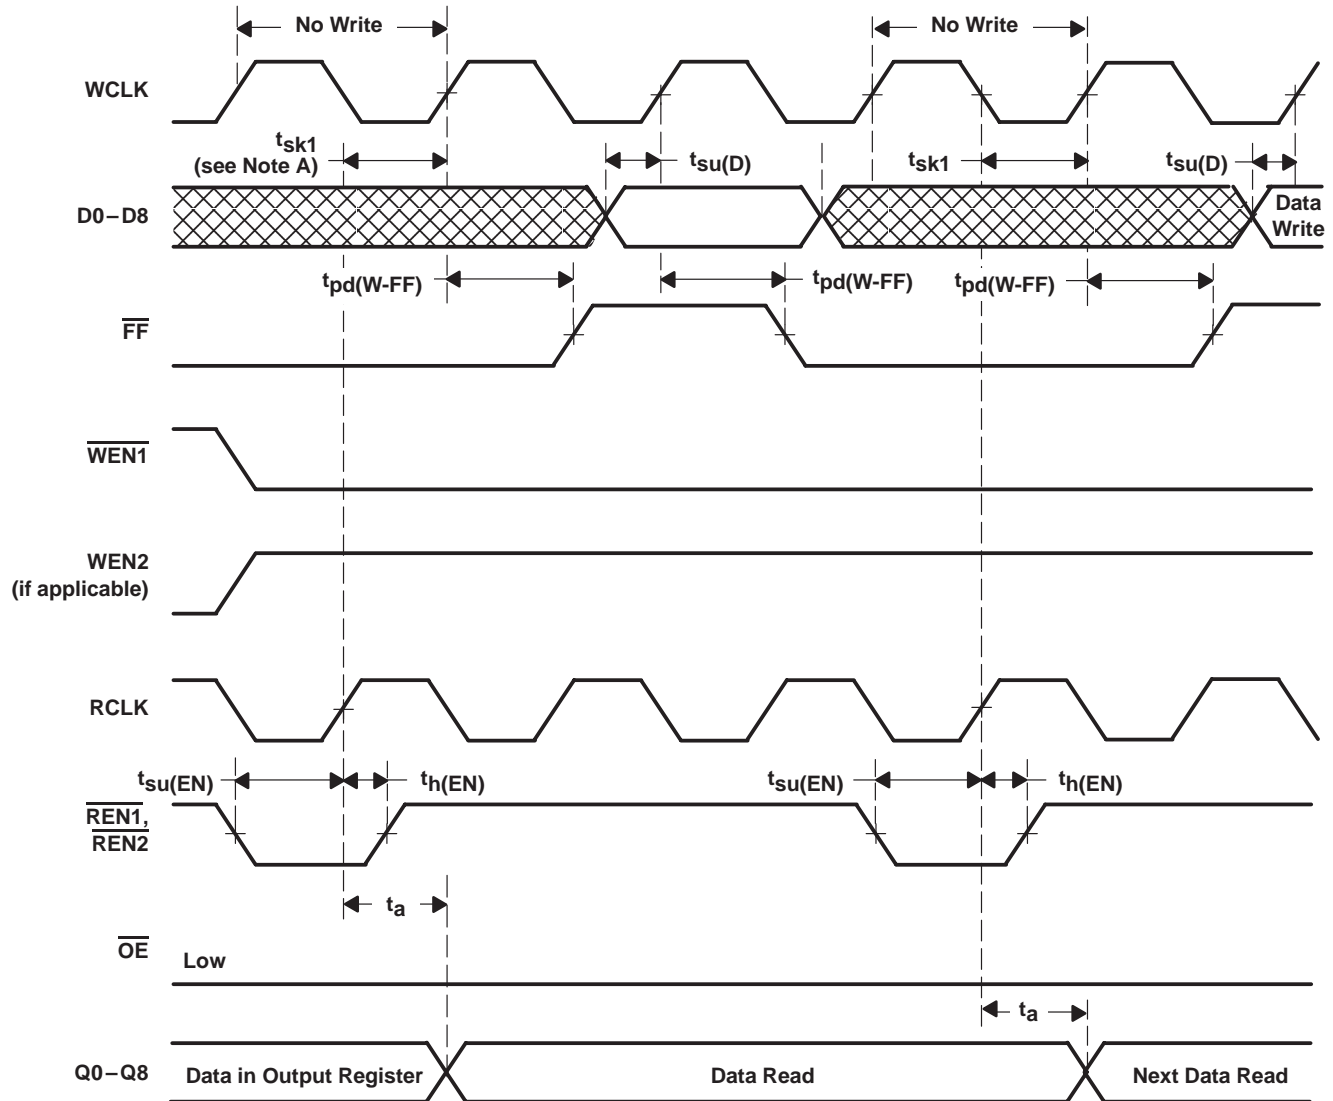

NOTE A: t_{sk1} is the minimum time between a rising WCLK edge and a subsequent rising RCLK edge for $\overline{\text{EF}}$ to change logic levels during the current clock cycle. If the time between the rising edge of WCLK and the subsequent rising edge of RCLK is less than t_{sk1} , then $\overline{\text{EF}}$ may not change its logic level until the next RCLK rising edge.

Figure 4. Read-Cycle Timing

NOTE A: t_{sk1} is the minimum time between a rising WCLK edge and a subsequent rising RCLK edge for \overline{EF} to change during the current clock cycle. If the time between the rising edge of WCLK and the rising edge of RCLK is less than t_{sk1} , then \overline{EF} may not change state until the next RCLK edge.

Figure 5. First-Data-Word-Latency Timing

NOTE A: t_{sk1} is the minimum time between a rising RCLK edge and a subsequent rising WCLK edge for \overline{FF} to change logic levels during the current clock cycle. If the time between the rising edge of RCLK and the subsequent rising edge of WCLK is less than t_{sk1} , then \overline{FF} may not change its logic level until the next WCLK rising edge.

≤ 63 bytes from the respective boundary for the SN74ACT72211L;

≤ 511 bytes from the respective boundary for the SN74ACT72221L/-72231L/-72241L;

minimum t_{c} is 20 ns for program values greater than those indicated above.

[‡] Applicable when the device is configured with two write-enable inputs ($\overline{\text{WEN2/LD}} = \overline{\text{WEN2}}$).

[§] Applicable when the device is configured to have programmable flags ($\overline{\text{WEN2/LD}} = \overline{\text{LD}}$).

SN74ACT72211L, SN74ACT72221L, SN74ACT72231L, SN74ACT72241L

512 × 9, 1024 × 9, 2048 × 9, AND 4096 × 9

SYNCHRONOUS FIRST-IN, FIRST-OUT MEMORIES

SCAS222 – FEBRUARY 1993 – REVISED JUNE 1993

switching characteristics over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted) (see Figures 2 through 13)

† These values are characterized but not tested.

APPLICATION INFORMATION

width-expansion configuration

Word width is increased by connecting the corresponding input control signals of multiple devices. Composite empty and full flags should be created by monitoring all devices in width expansion. Almost-full and almost-empty status can be obtained from any one device. Figure 12 shows an 18-bit-wide data path formed by using two SN74ACT72211L/72221L/72231L/72241L devices.

In Figure 12, read enable 2 ($\overline{\text{REN2}}$) is grounded and read enable 1 ($\overline{\text{REN1}}$) acts as the only read control. The write enable 2/load ($\overline{\text{WEN2/LD}}$) input of only one device is set low at reset to configure the device for programmable flags and to have it act as a load control for reading and writing the programmable flag offset registers.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take

reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
