Luminance, Chroma and Synchronizing Signals Processor IC for PAL/NTSC/SECAM  
COLOR TV

TB1239BF integrates luminance, chroma and synchronizing signals processing circuits for PAL/NTSC/SECAM color TV system.

TB1239BF incorporates high performance picture quality compensation circuits in luminance section, an automatic PAL/NTSC/SECAM discrimination and decode circuits in chroma section, and an automatic 50/60 Hz discrimination circuit in synchronizing section.

Besides a crystal oscillator generates 4.43 MHz, 3.58 MHz and M/N-PAL clock signals internally for color demodulation. A horizontal PLL circuit is also built in this IC.

PAL/SECAM demodulation circuits which are adjustment-free circuits incorporates a 1 H DL circuit inside for operating the base band signal processing system.

Also, TB1239BF makes it possible to set and to control various functions through the built-in I<sup>2</sup>C BUS line.

Weight: 0.83 g (typ.)

## Features

### Luminance Section

- Built-in chroma trap filter
- Black stretch circuit
- DC restoration circuit
- Y delay line
- Sharpness control
- Sub-Contrast control (–/+2 dB)
- Black set-up for PAL plus

### Chroma Section

- Built-in 1 H delay circuit (PAL/SECAM base band demodulation system)
- One crystal color demodulation circuit (4.43 MHz, 3.58 MHz, M/N-PAL)
- Automatic system discrimination system and forced system mode
- 1 H delay line also serves as comb filter in NTSC demodulation
- Built-in band-pass and take-off filter, SECAM bell filter
- Sub-Color control (–/+2 dB)

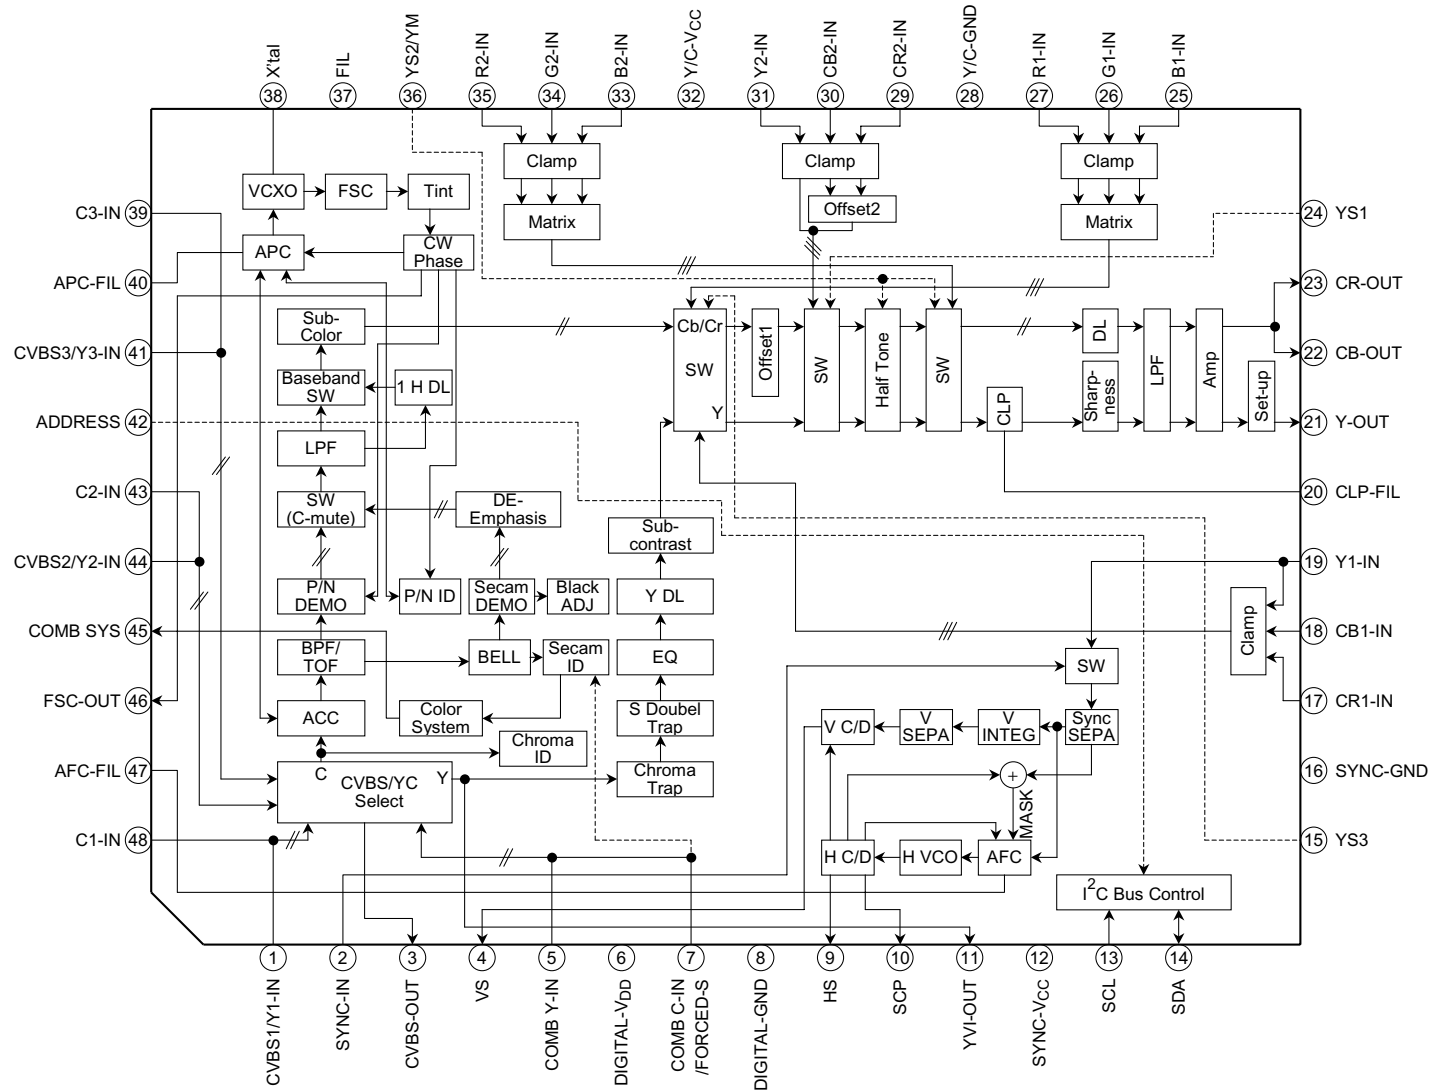

### Synchronizing Section

- Built-in horizontal VCO resonator
- Adjustment-free horizontal and vertical oscillation by count-down circuit
- Automatic vertical frequency discrimination circuit
- Noise detection circuit

### Others

- Y/C out level control
- 4-channels inputs switching
- 2-input circuit for RGB
- 2-input circuit for Y/Cb/Cr
- Y/Cb/Cr outputs
- Cb/Cr offset adjustment
- Built-in pre filters for A/D converter

Function Description

Video Select, Auto-SW

- (1) "AUTO-SW" = (1) Manual Select
- In video SW section, input signal is selected by the BUS as Figure 1 and Table 1. Mainly, CVBS-OUT (pin 3) is used for the comb filter input, and Yvi-OUT (pin 11) is used for synchronization (pin 2). Besides, on chroma line from video SW to main route, the peak detection is done during the burst period. The result is responded to the Read BUS data, C ID.

## External Input SWs

External inputs are selected by the BUS data and fast SWs. Final outputs from pin 21/22/23 are shown in Table 2. RGB1-IN interface complies with SCART connector. Therefore it is active, when RGB1-IN is enable by the BUS data and when YS3 (pin 15) is also high. The status of YS3 (pin 15) is responded to the Read BUS data, V15.

## Color System

Distinguishable color systems are selected by the write BUS data, COLOR SYSTEM. The demodulated color system is responded to the read BUS data, COLOR SYSTEM and XTAL. (refer to BUS CONTROL FUNCTION) The system data is also responded to Comb SYS (pin 45) and fsc-OUT (pin 46) as Table 3. If distinguishable color system signal is not received, the system data is responded with B/W.

Besides, if pin 7 is connected to VCC (more than 3.5 V), Forced SECAM mode is active. In this mode, SECAM system is identified forcibly. It has priority over the BUS selection.

**Table 3 DC Level of Pin 45 and 46 on Each Color System**

Color System	Pin 45	Pin 46
M-PAL	Low	Low
4.43PAL, SECAM, B/W	High	Low
3.58/4.43NTSC	Low	High
N-PAL	High	High

## Secam Bell Filter

SECAM bell filter characteristics can be changed by the BUS data, BELL/HPF. The group delay near chroma band is corrected by changing filter characteristic. As a result, S/N looks better. Besides, center frequency  $f_0$  of bell is changed by BELL  $f_0$ . Indirectly, it is changed by BPF (TOF)  $f_0$ .

**Figure 2 SECAM Bell Filter Characteristics**

## Vertical Count-Down

In Automatic of V C/D MODE, the vertical synchronization is controlled by internal PLL. In Fast mode, it is synchronized with the inputted synchronizing signal and the pull-in time is short. Furthermore the time is shorter in Very fast mode by the expanded pull-in range. Pull-in range of vertical count-down is determined by the BUS data, V C/D MODE and V-FREQ as Table 4.

**Table 4 V C/D Pull-In Range**

Note3: 00, 11; Normal

Normal vertical input mode. It is good performance of vertical phase keeping for standard TV signal sync. This mode is recommended in the state of stability. And this mode can detect teletext or VCR skew sync.

Note4: 01; Teletext

This mode is less performance of vertical phase keeping for standard TV signal sync against "Normal". However, pull-in speed is faster few vertical periods than "Normal". Therefore this mode is recommended for tesetext sync. On the other hand, this mode can detect standard TV signal sync in the state of stability but it is less performance of vertical phase keeping in week signal as about -3 dB against "Normal".

Note5: 10; Fast

This mode is same performance of vertical phase keeping for standard TV signal sync of "Teletext". But it is faster pull-in speed faster than "Teletext" because pull-in ranges wider than "Teletext". (refer to Table 5) Therefore, this mode is better to use when channel changing, but is not recommended to use in the state of stability or in week signal due to too wide pull-in range and incorrect actions of vertical keeping appearing.

## Y-DL Adjustment

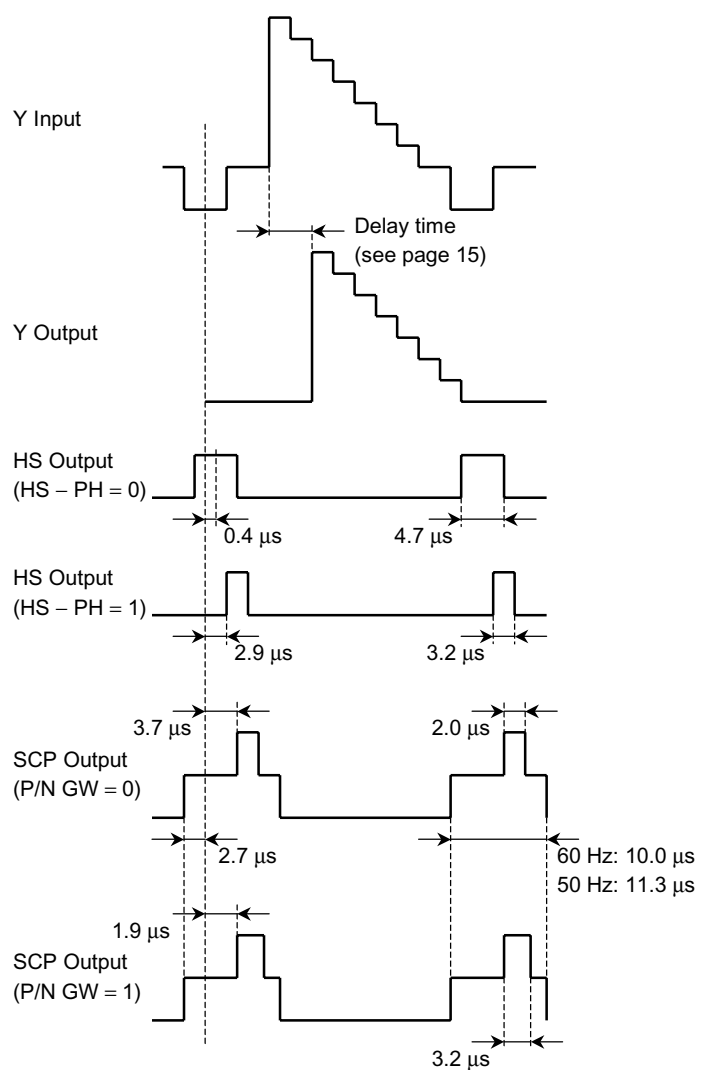

Table 5 shows Y output delays against Y input on condition with BPF =  $f_0$ , Q = 2.0, Y-DL = Min and LPF = ON. Y-out signal can be delayed by the BUS data, Y-DL. The adjustment time of one step is 40 ns.

- TOSHIBA is continually working to improve the quality and reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to comply with the standards of safety in making a safe design for the entire system, and to avoid situations in which a malfunction or failure of such TOSHIBA products could cause loss of human life, bodily injury or damage to property.  
In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent TOSHIBA products specifications. Also, please keep in mind the precautions and conditions set forth in the "Handling Guide for Semiconductor Devices," or "TOSHIBA Semiconductor Reliability Handbook" etc..
- The TOSHIBA products listed in this document are intended for usage in general electronics applications (computer, personal equipment, office equipment, measuring equipment, industrial robotics, domestic appliances, etc.). These TOSHIBA products are neither intended nor warranted for usage in equipment that requires extraordinarily high quality and/or reliability or a malfunction or failure of which may cause loss of human life or bodily injury ("Unintended Usage"). Unintended Usage include atomic energy control instruments, airplane or spaceship instruments, transportation instruments, traffic signal instruments, combustion control instruments, medical instruments, all types of safety devices, etc.. Unintended Usage of TOSHIBA products listed in this document shall be made at the customer's own risk.
