TOSHIBA MOS DIGITAL INTEGRATED CIRCUIT SILICON GATE CMOS

524,288-WORD BY 8-BIT FULL CMOS STATIC RAM

Lead-Free

DESCRIPTION

The TC55VCM208ASGN is a 4,194,304-bit static random access memory (SRAM) organized as 524,288 words by 8 bits. Fabricated using Toshiba's CMOS Silicon gate process technology, this device operates from a single 2.3 to 3.6 V power supply. Advanced circuit technology provides both high speed and low power at an operating current of 3 mA/MHz and a minimum cycle time of 40 ns. It is automatically placed in low-power mode at 0.7 μA standby current (at V_{DD} = 3 V, Ta = 25°C, typical) when chip enable ($\overline{CE1}$) is asserted high or (CE2) is asserted low. There are three control inputs. $\overline{CE1}$ and CE2 are used to select the device and for data retention control, and output enable ($\overline{OE}$) provides fast memory access. This device is well suited to various microprocessor system applications where high speed, low power and battery backup are required. And, with a guaranteed operating extreme temperature range of –40° to 85°C, the TC55VCM208ASGN can be used in environments exhibiting extreme temperature conditions. The TC55VCM208ASGN is available in a plastic 40-pin thin-small outline package (TSOP).

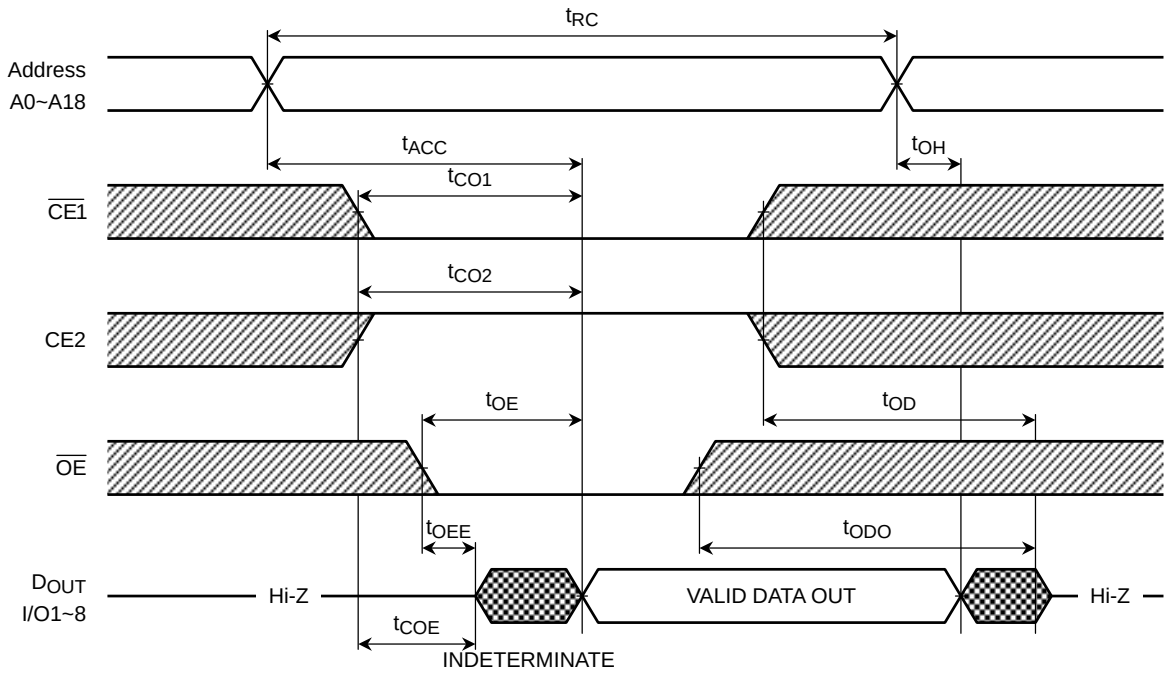
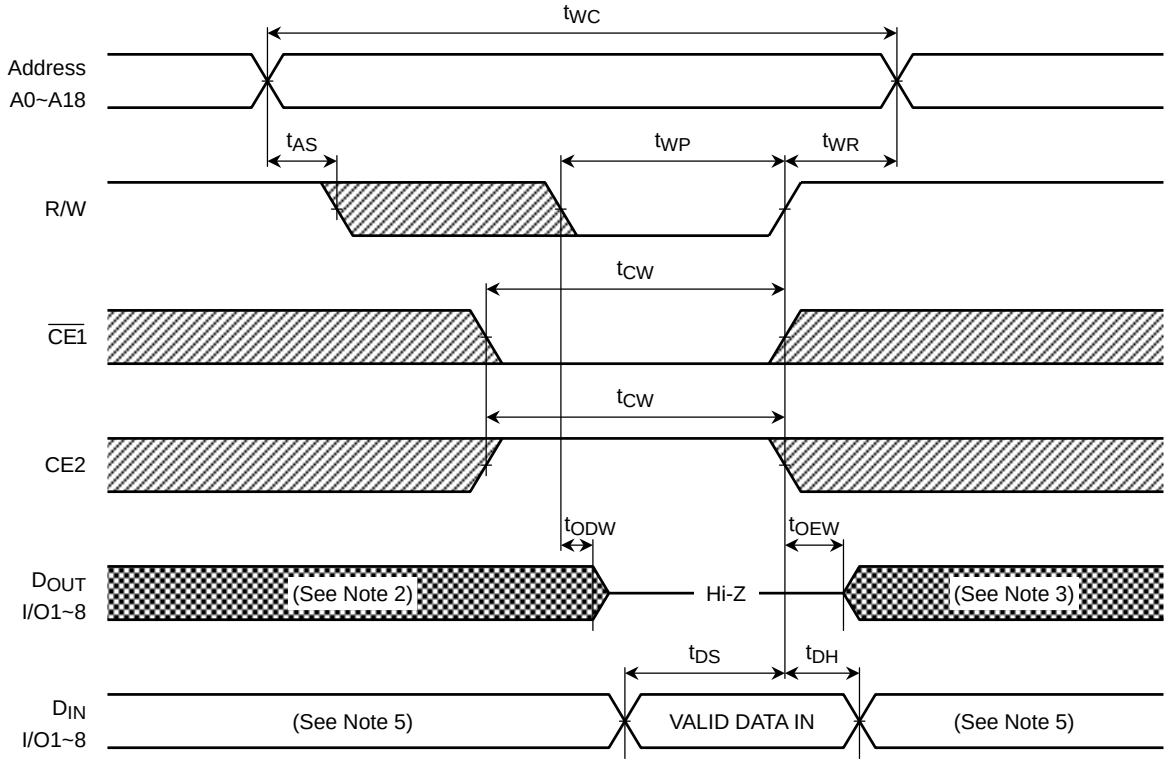
TIMING DIAGRAMS

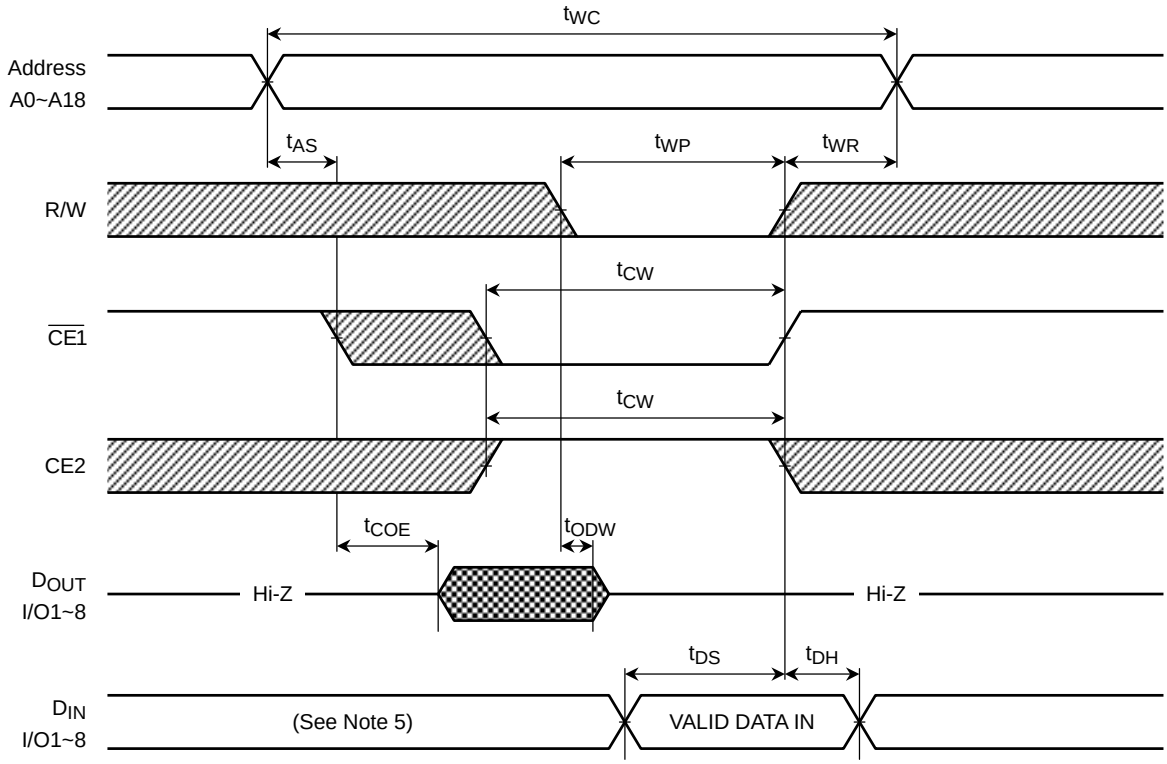
READ CYCLE (See Note 1)



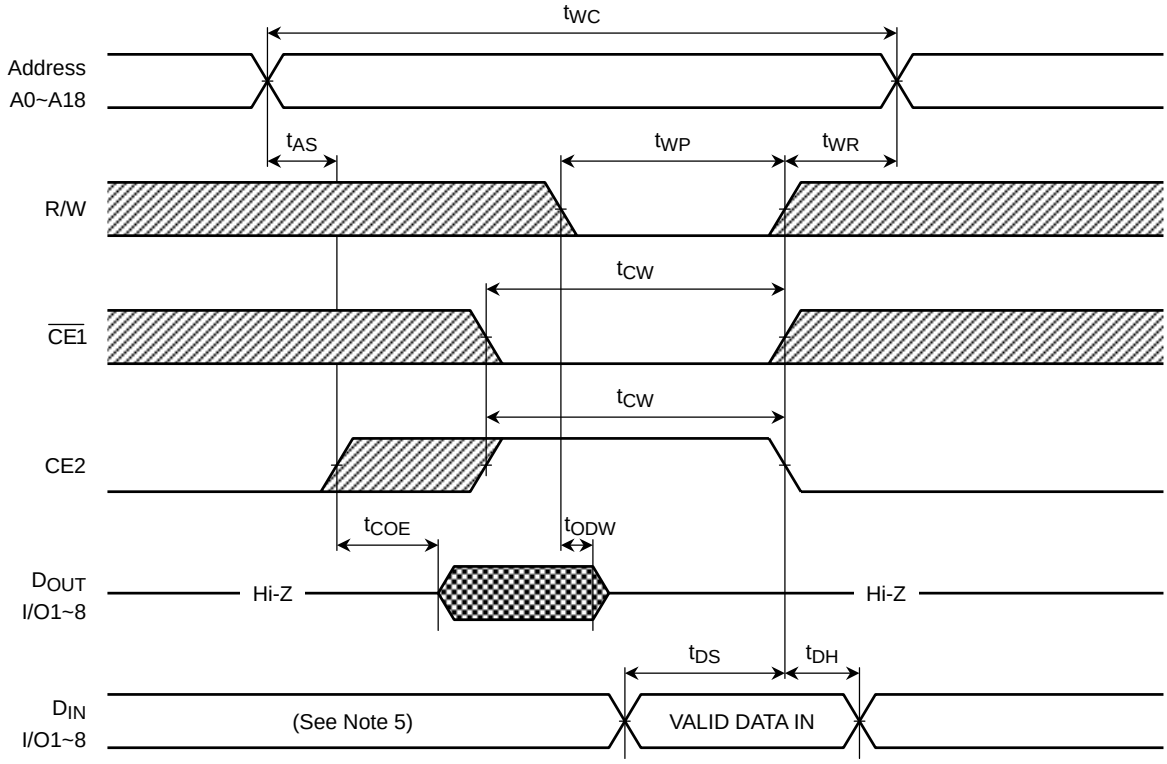
WRITE CYCLE 1 (R/W CONTROLLED) (See Note 4)



WRITE CYCLE 2 ($\overline{CE1}$ CONTROLLED) (See Note 4)



WRITE CYCLE 3 (CE2 CONTROLLED) (See Note 4)



Note:

(1) R/W remains HIGH for the read cycle.

(2) If $\overline{CE1}$ goes LOW(or CE2 goes HIGH) coincident with or after R/W goes LOW, the outputs will remain at high impedance.

(3) If $\overline{CE1}$ goes HIGH(or CE2 goes LOW) coincident with or before R/W goes HIGH, the outputs will remain at high impedance.

(4) If $\overline{OE}$ is HIGH during the write cycle, the outputs will remain at high impedance.

(5) Because I/O signals may be in the output state at this time, input signals of reverse polarity must not be applied.

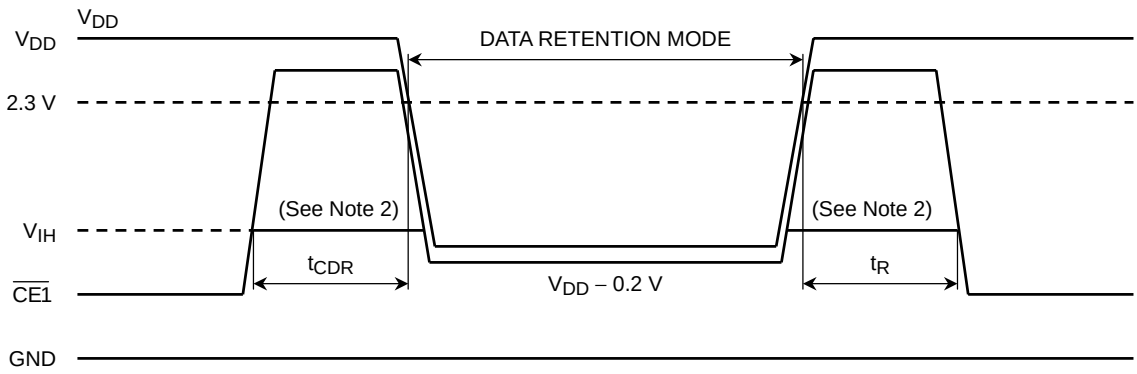
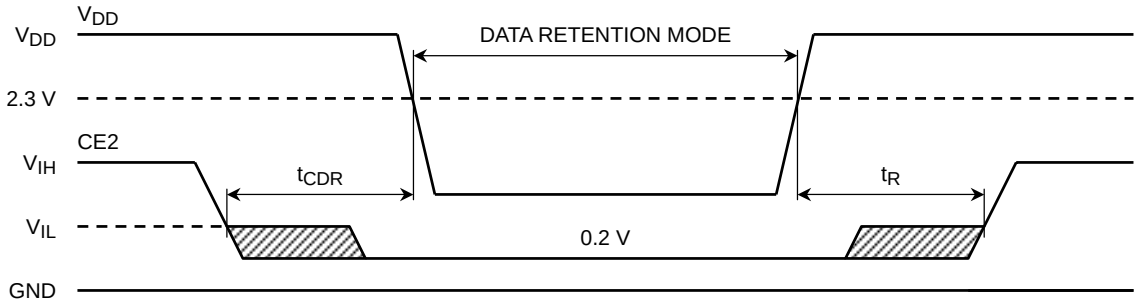
$\overline{CE1}$ CONTROLLED DATA RETENTION MODE (See Note 1)



CE2 CONTROLLED DATA RETENTION MODE (See Note 3)



Note:

(1) In $\overline{CE1}$ controlled data retention mode, minimum standby current mode is entered when CE2 ≤ 0.2 V or CE2 ≥ V_{DD} – 0.2 V.

(2) When $\overline{CE1}$ is operating at the V_{IH}(min.) level, the operating current is given by I_{DDS1} during the transition of V_{DD} from 2.3(2.7) to 2.2V(2.4 V).

(3) In CE2 controlled data retention mode, minimum standby current mode is entered when CE2 ≤ 0.2 V.
