

SUMMARY

High performance 32-bit/40-bit floating point processor
optimized for high performance audio processing
Single-instruction, multiple-data (SIMD) computational
architecture

On-chip memory—1M bit of on-chip SRAM and a dedicated
4M bit of on-chip mask-programmable ROM

Code compatible with all other members of the SHARC family

The ADSP-21371 is available with a 266 MHz core instruction
rate with unique audio centric peripherals such as the digi-
tal applications interface, serial ports, precision clock
generators and more. For complete ordering information,
see [Ordering Guide on Page 47](#)

KEY FEATURES – PROCESSOR CORE

At 266 MHz (3.75 ns) core instruction rate, the ADSP-21371 performs 1.596 GFLOPs/533 MMACs

1M bit on-chip, SRAM for simultaneous access by the core processor and DMA

4M bit on-chip, mask-programmable, ROM

Dual data address generators (DAGs) with modulo and bit-reverse addressing

Zero-overhead looping with single-cycle loop setup, providing efficient program sequencing

Single instruction multiple data (SIMD) architecture provides:

- Two computational processing elements
- Concurrent execution
- Code compatibility with other SHARC family members at the assembly level
- Parallelism in buses and computational units allows: Single cycle executions (with or without SIMD) of a multiply operation, an ALU operation, a dual memory read or write, and an instruction fetch

Transfers between memory and core at a sustained 4.25G byte/sec bandwidth at 266 MHz core instruction rate

INPUT/OUTPUT FEATURES

DMA controller supports:

- 32 DMA channels for transfers between ADSP-21371 internal memory and a variety of peripherals
- 32-bit DMA transfers at peripheral clock speed, in parallel with full-speed processor execution

32-Bit wide external port provides glueless connection to both synchronous (SDRAM) and asynchronous memory devices

Programmable wait state options: 2 to 31 SDCLK cycles

Delay-line DMA engine maintains circular buffers in external memory with tap/offset based reads

SDRAM accesses at 133 MHz and asynchronous accesses at 44.4 MHz

4 memory select lines allows multiple external memory devices

Digital audio interface (DAI) includes eight serial ports, four precision clock generators, an input data port, an S/PDIF transceiver, and a signal routing unit

Digital peripheral interface (DPI) includes, two timers, one UART, and two SPI ports, and a two wire interface port

Outputs of PCG's C and D can be driven on to DPI pins

Eight dual data line serial ports that operate at up to 33M bits/s on each data line — each has a clock, frame sync and two data lines that can be configured as either a receiver or transmitter pair

TDM support for telecommunications interfaces including 128 TDM channel support for newer telephony interfaces such as H.100/H.110

Up to 16 TDM stream support, each with 128 channels per frame

Companding selection on a per channel basis in TDM mode

Input data port, configurable as eight channels of serial data or seven channels of serial data and up to a 20-bit wide parallel data channel

Signal routing unit provides configurable and flexible connections between all DAI/DPI components

2 Muxed Flag/ $\overline{\text{IRQ}}$ lines

1 Muxed Flag/Timer expired line $\overline{\text{MS}}$ pin

S/PDIF compatible digital audio receiver/transmitter supports EIAJ CP-340 (CP-1201), IEC-958, AES/EBU standards

Left-justified, I^2S or right-justified serial data input with 16, 18, 20 or 24-bit word widths (transmitter)

Pulse width modulation provides:

- 16 PWM outputs configured as four groups of four outputs supports center-aligned or edge-aligned PWM waveforms

1 Muxed Flag/ $\overline{\text{IRQ}}$ / $\overline{\text{MS}}$ pin

ROM Based Security features include:

- JTAG access to memory permitted with a 64-bit key
- Protected memory regions that can be assigned to limit access under program control to sensitive code

PLL has a wide variety of software and hardware multiplier/divider ratios

Dual voltage: 3.3 V I/O, 1.2 V core

Available in 208-lead MQFP Package (see [Ordering Guide on Page 47](#))

REVISION HISTORY

5/06—Revision PrA: Initial version

GENERAL DESCRIPTION

The ADSP-21371 SHARC processor is a member of the SIMD SHARC family of DSPs that feature Analog Devices' Super Harvard Architecture. The ADSP-21371 is source code compatible with the ADSP-2126x, ADSP-2136x, and ADSP-2116x DSPs as well as with first generation ADSP-2106x SHARC processors in SISD (single-instruction, single-data) mode. The ADSP-21371 is a 32-bit/40-bit floating point processors optimized for high performance automotive audio applications with its large on-chip SRAM and mask-programmable ROM, multiple internal buses to eliminate I/O bottlenecks, and an innovative digital applications interface (DAI).

As shown in the functional block diagram on Page 1, the ADSP-21371 uses two computational units to deliver a significant performance increase over the previous SHARC processors on a range of DSP algorithms. Fabricated in a state-of-the-art, high speed, CMOS process, the ADSP-21371 processor achieves an instruction cycle time of 3.75 ns at 266 MHz. With its SIMD computational hardware, the ADSP-21371 can perform 1.596 GFLOPS running at 266 MHz.

Table 1 shows performance benchmarks for the ADSP-21371.

Table 1. ADSP-21371 Benchmarks (at 266 MHz)

Benchmark Algorithm	Speed (at 266 MHz)
1024 Point Complex FFT (Radix 4, with reversal)	34.5 μ s
FIR Filter (per tap) ¹	1.88 ns
IIR Filter (per biquad) ¹	7.5 ns
Matrix Multiply (pipelined)	
[3x3] \times [3x1]	16.91 ns
[4x4] \times [4x1]	30.07 ns
Divide (y/x)	11.27 ns
Inverse Square Root	16.91 ns

¹ Assumes two files in multichannel SIMD mode

The ADSP-21371 continues SHARC's industry leading standards of integration for DSPs, combining a high performance 32-bit DSP core with integrated, on-chip system features.

The block diagram of the ADSP-21371 on Page 1, illustrates the following architectural features:

- Two processing elements, each of which comprises an ALU, multiplier, shifter and data register file
- Data address generators (DAG1, DAG2)
- Program sequencer with instruction cache
- PM and DM buses capable of supporting four 32-bit data transfers between memory and the core at every core processor cycle
- Two programmable interval timers with external event counter capabilities
- On-chip SRAM (1M bit)

- On-chip mask-programmable ROM (4M bit)
- JTAG test access port

The block diagram of the ADSP-21371 on Page 1 also illustrates the following architectural features:

- DMA controller
- Digital applications interface that includes four precision clock generators (PCG), an S/PDIF compatible digital audio receiver/transmitter, an input data port (IDP), eight serial ports, eight serial interfaces, a 16-bit parallel input port (PDAP), and a flexible signal routing unit (DAI SRU).
- Digital peripheral interface that includes two timers, one UART, two serial peripheral interfaces (SPI), a two wire interface (TWI), and a flexible signal routing unit (DPI SRU).

ADSP-21371 FAMILY CORE ARCHITECTURE

The ADSP-21371 is code compatible at the assembly level with the ADSP-21375, ADSP-2136x, ADSP-2126x, ADSP-21160 and ADSP-21161, and with the first generation ADSP-2106x SHARC processors. The ADSP-21371 shares architectural features with the ADSP-2126x, ADSP-2136x, and ADSP-2116x SIMD SHARC processors, as detailed in the following sections.

SIMD Computational Engine

The ADSP-21371 contains two computational processing elements that operate as a single-instruction, multiple-data (SIMD) engine. The processing elements are referred to as PEX and PEY and each contains an ALU, multiplier, shifter and register file. PEX is always active, and PEY may be enabled by setting the PEYEN mode bit in the MODE1 register. When this mode is enabled, the same instruction is executed in both processing elements, but each processing element operates on different data. This architecture is efficient at executing math intensive DSP algorithms.

Entering SIMD mode also has an effect on the way data is transferred between memory and the processing elements. When in SIMD mode, twice the data bandwidth is required to sustain computational operation in the processing elements. Because of this requirement, entering SIMD mode also doubles the bandwidth between memory and the processing elements. When using the DAGs to transfer data in SIMD mode, two data values are transferred with each access of memory or the register file.

Independent, Parallel Computation Units

Within each processing element is a set of computational units. The computational units consist of an arithmetic/logic unit (ALU), multiplier, and shifter. These units perform all operations in a single cycle. The three units within each processing element are arranged in parallel, maximizing computational throughput. Single multifunction instructions execute parallel ALU and multiplier operations. In SIMD mode, the parallel ALU and multiplier operations occur in both processing ele-

ments. These computation units support IEEE 32-bit single-precision floating-point, 40-bit extended precision floating-point, and 32-bit fixed-point data formats.

Data Register File

A general-purpose data register file is contained in each processing element. The register files transfer data between the computation units and the data buses, and store intermediate results. These 10-port, 32-register (16 primary, 16 secondary) register files, combined with the ADSP-2136x enhanced Harvard architecture, allow unconstrained data flow between computation units and internal memory. The registers in PEX are referred to as R0-R15 and in PEY as S0-S15.

Single-Cycle Fetch of Instruction and Four Operands

The ADSP-21371 features an enhanced Harvard architecture in which the data memory (DM) bus transfers data and the program memory (PM) bus transfers both instructions and data (see [Figure 1 on page 1](#)). With the ADSP-21371's separate program and data memory buses and on-chip instruction cache, the processor can simultaneously fetch four operands (two over each data bus) and one instruction (from the cache), all in a single cycle.

Instruction Cache

The ADSP-21371 includes an on-chip instruction cache that enables three-bus operation for fetching an instruction and four data values. The cache is selective—only the instructions whose fetches conflict with PM bus data accesses are cached. This cache allows full-speed execution of core, looped operations such as digital filter multiply-accumulates, and FFT butterfly processing.

Data Address Generators With Zero-Overhead Hardware Circular Buffer Support

The ADSP-21371's two data address generators (DAGs) are used for indirect addressing and implementing circular data buffers in hardware. Circular buffers allow efficient programming of delay lines and other data structures required in digital signal processing, and are commonly used in digital filters and Fourier transforms. The two DAGs of the ADSP-21371 contain sufficient registers to allow the creation of up to 32 circular buffers (16 primary register sets, 16 secondary). The DAGs automatically handle address pointer wraparound, reduce overhead, increase performance, and simplify implementation. Circular buffers can start and end at any memory location.

Flexible Instruction Set

The 48-bit instruction word accommodates a variety of parallel operations, for concise programming. For example, the ADSP-21371 can conditionally execute a multiply, an add, and a subtract in both processing elements while branching and fetching up to four 32-bit values from memory—all in a single instruction.

ADSP-21371 MEMORY

The ADSP-21371 adds the following architectural features to the SIMD SHARC family core.

On-Chip Memory

The ADSP-21371 contains 1 megabit of internal RAM and four megabits of internal mask-programmable ROM. Each block can be configured for different combinations of code and data storage (see [Table 2 on page 6](#)). Each memory block supports single-cycle, independent accesses by the core processor and I/O processor. The ADSP-21371 memory architecture, in combination with its separate on-chip buses, allow two data transfers from the core and one from the I/O processor, in a single cycle.

The ADSP-21371's, SRAM can be configured as a maximum of 32K words of 32-bit data, 64K words of 16-bit data, 21.3K words of 48-bit instructions (or 40-bit data), or combinations of different word sizes up to 1 megabit. All of the memory can be accessed as 16-bit, 32-bit, 48-bit, or 64-bit words. A 16-bit floating-point storage format is supported that effectively doubles the amount of data that may be stored on-chip. Conversion between the 32-bit floating-point and 16-bit floating-point formats is performed in a single instruction. While each memory block can store combinations of code and data, accesses are most efficient when one block stores data using the DM bus for transfers, and the other block stores instructions and data using the PM bus for transfers.

Using the DM bus and PM buses, with one bus dedicated to a memory block, assures single-cycle execution with two data transfers. In this case, the instruction must be available in the cache.

EXTERNAL MEMORY

The external port on the ADSP-21371 SHARC provides a high performance, glueless interface to a wide variety of industry-standard memory devices. The 32-bit wide bus may be used to interface to synchronous and/or asynchronous memory devices through the use of its separate internal memory controllers: the first is an SDRAM controller for connection of industry-standard synchronous DRAM devices and DIMMs (Dual Inline Memory Module), while the second is an asynchronous memory controller intended to interface to a variety of memory devices. Four memory select pins enable up to four separate devices to coexist, supporting any desired combination of synchronous and asynchronous device types. Non SDRAM external memory address space is shown in [Table 3](#).

External Memory Execution

In the ADSP-21371, the program sequencer can execute code directly from external memory (SRAM, SDRAM). This allows a reduction in internal memory size, thereby reducing the die area. With external execution, programs run at slower speeds since 48-bit instructions are fetched in parts from a 32-bit external bus coupled with the inherent latency of fetching instructions from SDRAM. Fetching instructions from external memory generally take 1.5 peripheral clock cycles per instruction.

Table 2. ADSP-21371 Internal Memory Space

SDRAM Controller

The SDRAM controller provides an interface to up to four separate banks of industry-standard SDRAM devices or DIMMs, at speeds up to f_{CLK} . Fully compliant with the SDRAM standard, each bank can have its own memory select line ($\overline{\text{MS0}}\text{--}\overline{\text{MS3}}$), and can be configured to contain between 16M bytes and 128M bytes of memory. SDRAM external memory address space is shown in Table 4.

The controller maintains all of the banks as a contiguous address space so that the processor sees this as a single address space, even if different size devices are used in the different banks.

A set of programmable timing parameters is available to configure the SDRAM banks to support slower memory devices. The memory banks can be configured as 16 bits wide.

The SDRAM controller address, data, clock, and command pins can drive loads up to 30 pF. For larger memory systems, the SDRAM controller external buffer timing should be selected and external buffering should be provided so that the load on the SDRAM controller pins does not exceed 30 pF.

Table 3. External Memory for Non SDRAM Addresses

Bank	Size in words	Address Range
Bank 0	14M	0x0020 0000 – 0x00FF FFFF
Bank 1	16M	0x0400 0000 – 0x04FF FFFF
Bank 2	16M	0x0800 0000 – 0x08FF FFFF
Bank 3	16M	0x0C00 0000 – 0x0CFF FFFF

Table 4. External Memory for SDRAM Addresses

Bank	Size in words	Address Range
Bank 0	62M	0x0020 0000 – 0x03FF FFFF
Bank 1	64M	0x0400 0000 – 0x07FF FFFF
Bank 2	64M	0x0800 0000 – 0x0BFF FFFF
Bank 3	64M	0x0C00 0000 – 0x0FFF FFFF

Note that the external memory bank addresses shown are for normal word accesses. If 48-bit instructions are placed in any such bank (with two instructions packed into three 32-bit locations), then care must be taken to map data buffers in the same bank. For example, if 2K instructions are placed starting at the bank 0 base address (0x0020 0000), then the data buffers can be placed starting at an address that is offset by 3K words (0x0020 0C00).

Asynchronous Controller

The asynchronous memory controller provides a configurable interface for up to four separate banks of memory or I/O devices. Each bank can be independently programmed with dif-

ferent timing parameters, enabling connection to a wide variety of memory devices including SRAM, ROM, flash, and EPROM, as well as I/O devices that interface with standard memory control lines. Bank0 occupies a 14.7M word window and banks 1, 2, and 3 occupy a 16M word window in the processor's address space but, if not fully populated, these windows are not made contiguous by the memory controller logic. The banks can also be configured as 8-bit or 16-bit wide buses for ease of interfacing to a range of memories and I/O devices tailored either to high performance or to low cost and power.

The asynchronous memory controller is capable of a maximum throughput of 176M bytes/sec using a 44MHz external bus speed. Other features include 8 to 32-bit and 16 to 32-bit packing and unpacking, booting from bank select 1, and support for delay line DMA.

ADSP-21371 INPUT/OUTPUT FEATURES

The ADSP-21371 I/O processor provides 24 channels of DMA, as well as an extensive set of peripherals. These include a 20 pin digital applications interface which controls:

- Eight serial ports
- S/PDIF receiver/transmitter
- Four precision clock generators
- Internal data port/parallel data acquisition port

The ADSP-21371 processor also contains a 14 pin digital peripheral interface which controls:

- Two general-purpose timers
- Two serial peripheral interfaces
- One universal asynchronous receiver/transmitter (UART)
- An I²C compatible two wire interface

DMA Controller

The ADSP-21371's on-chip DMA controller allows data transfers without processor intervention. The DMA controller operates independently and invisibly to the processor core, allowing DMA operations to occur while the core is simultaneously executing its program instructions. DMA transfers can occur between the ADSP-21371's internal memory and its serial ports, the SPI-compatible (serial peripheral interface) ports, the IDP (input data port), the parallel data acquisition port (PDAP) or the UART. Thirty-two channels of DMA are available on the ADSP-21371—16 via the serial ports, eight via the input data port, two for the UART, two for the SPI interface, two for the external port, and two for memory-to-memory transfers. Programs can be downloaded to the ADSP-21371 using DMA transfers. Other DMA features include interrupt generation upon completion of DMA transfers, and DMA chaining for automatic linked DMA transfers.

Delay Line DMA

The ADSP-21371 processor provides delay line DMA functionality. This allows processor reads and writes to external delay line buffers (and hence to external memory) with limited core interaction.

Digital Applications Interface (DAI)

The digital applications interface (DAI) provides the ability to connect various peripherals to any of the DSPs DAI pins (DAI_P20–1).

Programs make these connections using the signal routing unit (SRU), shown in Figure 1.

The SRU is a matrix routing unit (or group of multiplexers) that enables the peripherals provided by the DAI to be interconnected under software control. This allows easy use of the DAI associated peripherals for a much wider variety of applications by using a larger set of algorithms than is possible with non configurable signal paths.

The DAI also includes eight serial ports, four precision clock generators (PCG), and an input data port (IDP). The IDP provides an additional input path to the ADSP-21371 core, configurable as either eight channels of I²S serial data, or a single 20-bit wide synchronous parallel data acquisition port. Each data channel has its own DMA channel that is independent from the ADSP-21371's serial ports.

Serial Ports

The ADSP-21371 features eight synchronous serial ports that provide an inexpensive interface to a wide variety of digital and mixed-signal peripheral devices such as Analog Devices' AD183x family of audio codecs, ADCs, and DACs. The serial ports are made up of two data lines, a clock and frame sync. The data lines can be programmed to either transmit or receive and each data line has a dedicated DMA channel.

Serial ports are enabled via 16 programmable and simultaneous receive or transmit pins that support up to 32 transmit or 32 receive channels of audio data when all eight SPORTs are enabled, or eight full duplex TDM streams of 128 channels per frame.

The serial ports operate at a maximum data rate of 33M bits/s. Serial port data can be automatically transferred to and from on-chip memory via dedicated DMA channels. Each of the serial ports can work in conjunction with another serial port to provide TDM support. One SPORT provides two transmit signals while the other SPORT provides the two receive signals. The frame sync and clock are shared.

Serial ports operate in five modes:

- Standard DSP serial mode
- Multichannel (TDM) mode with support for packed I²S mode
- I²S mode
- Packed I²S mode
- Left-justified sample pair mode

Left-justified sample pair mode is a mode where in each frame sync cycle two samples of data are transmitted/received—one sample on the high segment of the frame sync, the other on the low segment of the frame sync. Programs have control over various attributes of this mode.

Each of the serial ports supports the left-justified sample pair and I²S protocols (I²S is an industry standard interface commonly used by audio codecs, ADCs and DACs such as the Analog Devices AD183x family), with two data pins, allowing four left-justified sample pair or I²S channels (using two stereo devices) per serial port, with a maximum of up to 32 I²S channels. The serial ports permit little-endian or big-endian transmission formats and word lengths selectable from 3 bits to 32 bits. For the left-justified sample pair and I²S modes, data-word lengths are selectable between 8 bits and 32 bits. Serial ports offer selectable synchronization and transmit modes as well as optional μ -law or A-law companding selection on a per channel basis. Serial port clocks and frame syncs can be internally or externally generated.

The serial ports also contain frame sync error detection logic where the serial ports detect frame syncs that arrive early (for example frame syncs that arrive while the transmission/reception of the previous word is occurring). All the serial ports also share one dedicated error interrupt.

S/PDIF Compatible Digital Audio Receiver/Transmitter and Synchronous/Asynchronous Sample Rate Converter

The S/PDIF receiver/transmitter has no separate DMA channels. It receives audio data in serial format and converts it into a biphasic encoded signal. The serial data input to the receiver/transmitter can be formatted as left justified, I²S or right justified with word widths of 16, 18, 20, or 24 bits.

The serial data, clock, and frame sync inputs to the S/PDIF receiver/transmitter are routed through the signal routing unit (SRU). They can come from a variety of sources such as the SPORTs, external pins, the precision clock generators (PCGs), or the sample rate converters (SRC) and are controlled by the SRU control registers.

The sample rate converter (SRC) contains four SRC blocks and is the same core as that used in the AD1896 192 kHz stereo asynchronous sample rate converter and provides up to 128 dB SNR. The SRC block is used to perform synchronous or asynchronous sample rate conversion across independent stereo channels, without using internal processor resources. The four SRC blocks can also be configured to operate together to convert multichannel audio data without phase mismatches. Finally, the SRC is used to clean up audio data from jittery clock sources such as the S/PDIF receiver.

Digital Peripheral Interface (DPI)

The digital peripheral interface provides connections to two serial peripheral interface ports (SPI), one universal asynchronous receiver-transmitter (UART), 12 flags, a two wire interface (TWI), and two general-purpose timers.

Serial Peripheral (Compatible) Interface

The ADSP-21371 SHARC processor contains two serial peripheral interface ports (SPIs). The SPI is an industry standard synchronous serial link, enabling the ADSP-21371 SPI compatible port to communicate with other SPI compatible devices. The SPI consists of two data pins, one device select pin, and one clock pin. It is a full-duplex synchronous serial interface, sup-

porting both master and slave modes. The SPI port can operate in a multimaster environment by interfacing with up to four other SPI compatible devices, either acting as a master or slave device. The ADSP-21371 SPI compatible peripheral implementation also features programmable baud rate and clock phase and polarities. The ADSP-21371 SPI compatible port uses open drain drivers to support a multimaster configuration and to avoid data contention.

UART Port

The ADSP-21371 processor provides a full-duplex Universal Asynchronous Receiver/Transmitter (UART) port, which is fully compatible with PC-standard UARTs. The UART port provides a simplified UART interface to other peripherals or hosts, supporting full-duplex, DMA-supported, asynchronous transfers of serial data. The UART also has multiprocessor communication capability using 9-bit address detection. This allows it to be used in multidrop networks through the RS-485 data interface standard. The UART port also includes support for 5 to 8 data bits, 1 or 2 stop bits, and none, even, or odd parity. The UART port supports two modes of operation:

- PIO (programmed I/O) – The processor sends or receives data by writing or reading I/O-mapped UART registers. The data is double-buffered on both transmit and receive.
- DMA (direct memory access) – The DMA controller transfers both transmit and receive data. This reduces the number and frequency of interrupts required to transfer data to and from memory. The UART has two dedicated DMA channels, one for transmit and one for receive. These DMA channels have lower default priority than most DMA channels because of their relatively low service rates.

The UART port's baud rate, serial data format, error code generation and status, and interrupts are programmable:

- Supporting bit rates ranging from ($f_{\text{CLK}}/1,048,576$) to ($f_{\text{CLK}}/16$) bits per second.
- Supporting data formats from 7 to 12 bits per frame.
- Both transmit and receive operations can be configured to generate maskable interrupts to the processor.

where the 16-bit UART_Divisor comes from the DLH register (most significant 8 bits) and DLL register (least significant 8 bits).

In conjunction with the general-purpose timer functions, auto-baud detection is supported.

Timers

The ADSP-21371 has a total of three timers: a core timer that can generate periodic software interrupts and two general purpose timers that can generate periodic interrupts and be independently set to operate in one of three modes:

- Pulse waveform generation mode
- Pulse width count/capture mode
- External event watchdog mode

The core timer can be configured to use FLAG3 as a timer expired signal, and each general purpose timer has one bidirectional pin and four registers that implement its mode of operation: a 6-bit configuration register, a 32-bit count register, a 32-bit period register, and a 32-bit pulse width register. A single control and status register enables or disables both general purpose timers independently.

Two Wire Interface Port (TWI)

The TWI is a bi-directional 2-wire, serial bus used to move 8-bit data while maintaining compliance with the I²C bus protocol. The TWI master incorporates the following features:

- Simultaneous master and slave operation on multiple device systems with support for multi master data arbitration
- Digital filtering and timed event processing
- 7 and 10 bit addressing
- 100K bits/s and 400K bits/s data rates
- Low interrupt rate

Pulse Width Modulation

The PWM module is a flexible, programmable, PWM waveform generator that can be programmed to generate the required switching patterns for various applications related to motor and engine control or audio power control. The PWM generator can generate either center-aligned or edge-aligned PWM waveforms. In addition, it can generate complementary signals on two outputs in paired mode or independent signals in non-paired mode (applicable to a single group of four PWM waveforms).

The entire PWM module has four groups of four PWM outputs each. Therefore, this module generates 16 PWM outputs in total. Each PWM group produces two pairs of PWM signals on the four PWM outputs.

The PWM generator is capable of operating in two distinct modes while generating center-aligned PWM waveforms: single update mode or double update mode. In single update mode the duty cycle values are programmable only once per PWM period. This results in PWM patterns that are symmetrical about the mid-point of the PWM period. In double update mode, a second updating of the PWM registers is implemented at the mid-point of the PWM period. In this mode, it is possible to produce asymmetrical PWM patterns that produce lower harmonic distortion in three-phase PWM inverters.

ROM Based Security

The ADSP-21371 has a ROM security feature that provides hardware support for securing user software code by preventing unauthorized reading from the internal code when enabled. When using this feature, the processor does not boot-load any external code, executing exclusively from internal SRAM/ROM. Additionally, the processor is not freely accessible via the JTAG port. Instead, a unique 64-bit key, which must be scanned in through the JTAG or Test Access Port will be assigned to each

customer. The device will ignore a wrong key. Emulation features and external boot modes are only available after the correct key is scanned.

SYSTEM DESIGN

The following sections provide an introduction to system design options and power supply issues.

Program Booting

The internal memory of the ADSP-21371 boots at system power-up from an 8-bit EPROM via the external port, an SPI master, or an SPI slave. Booting is determined by the boot configuration (BOOTCFG1–0) pins (see [Table 7 on page 14](#)). Selection of the boot source is controlled via the SPI as either a master or slave device, or it can immediately begin executing from ROM.

Power Supplies

The ADSP-21371 has separate power supply connections for the internal (V_{DDINT}), and external (V_{DDEXT}) power supplies. The internal supplies must meet the 1.2V requirement. The external supply must meet the 3.3V requirement. All external supply pins must be connected to the same power supply.

Target Board JTAG Emulator Connector

Analog Devices DSP Tools product line of JTAG emulators uses the IEEE 1149.1 JTAG test access port of the ADSP-21371 processor to monitor and control the target board processor during emulation. Analog Devices DSP Tools product line of JTAG emulators provides emulation at full processor speed, allowing inspection and modification of memory, registers, and processor stacks. The processor's JTAG interface ensures that the emulator will not affect target system loading or timing.

For complete information on Analog Devices' SHARC DSP Tools product line of JTAG emulator operation, see the appropriate "Emulator Hardware User's Guide".

DEVELOPMENT TOOLS

The ADSP-21371 is supported with a complete set of CROSSCORE[®] software and hardware development tools, including Analog Devices emulators and VisualDSP++[®] development environment. The same emulator hardware that supports other SHARC processors also fully emulates the ADSP-21371.

The VisualDSP++ project management environment lets programmers develop and debug an application. This environment includes an easy to use assembler (which is based on an algebraic syntax), an archiver (librarian/library builder), a linker, a loader, a cycle-accurate instruction-level simulator, a C/C++ compiler, and a C/C++ runtime library that includes DSP and mathematical functions. A key point for these tools is C/C++ code efficiency. The compiler has been developed for efficient translation of C/C++ code to DSP assembly. The SHARC has architectural features that improve the efficiency of compiled C/C++ code.

The VisualDSP++ debugger has a number of important features. Data visualization is enhanced by a plotting package that offers a significant level of flexibility. This graphical representation of user data enables the programmer to quickly determine the performance of an algorithm. As algorithms grow in complexity, this capability can have increasing significance on the designer's development schedule, increasing productivity. Statistical profiling enables the programmer to non intrusively poll the processor as it is running the program. This feature, unique to VisualDSP++, enables the software developer to passively gather important code execution metrics without interrupting the real-time characteristics of the program. Essentially, the developer can identify bottlenecks in software quickly and efficiently. By using the profiler, the programmer can focus on those areas in the program that impact performance and take corrective action.

Debugging both C/C++ and assembly programs with the VisualDSP++ debugger, programmers can:

- View mixed C/C++ and assembly code (interleaved source and object information)
- Insert breakpoints
- Set conditional breakpoints on registers, memory, and stacks
- Trace instruction execution
- Perform linear or statistical profiling of program execution
- Fill, dump, and graphically plot the contents of memory
- Perform source level debugging
- Create custom debugger windows

The VisualDSP++ IDDE lets programmers define and manage DSP software development. Its dialog boxes and property pages let programmers configure and manage all of the SHARC development tools, including the color syntax highlighting in the VisualDSP++ editor. This capability permits programmers to:

- Control how the development tools process inputs and generate outputs
- Maintain a one-to-one correspondence with the tool's command line switches

The VisualDSP++ Kernel (VDK) incorporates scheduling and resource management tailored specifically to address the memory and timing constraints of DSP programming. These capabilities enable engineers to develop code more effectively, eliminating the need to start from the very beginning, when developing new application code. The VDK features include Threads, Critical and Unscheduled regions, Semaphores, Events, and Device flags. The VDK also supports Priority-based, Preemptive, Cooperative, and Time-Sliced scheduling approaches. In addition, the VDK was designed to be scalable. If the application does not use a specific feature, the support code for that feature is excluded from the target system.

Because the VDK is a library, a developer can decide whether to use it or not. The VDK is integrated into the VisualDSP++ development environment, but can also be used via standard command line tools. When the VDK is used, the development

environment assists the developer with many error-prone tasks and assists in managing system resources, automating the generation of various VDK based objects, and visualizing the system state, when debugging an application that uses the VDK.

VisualDSP++ Component Software Engineering (VCSE) is Analog Devices' technology for creating, using, and reusing software components (independent modules of substantial functionality) to quickly and reliably assemble software applications. Download components from the Web and drop them into the application. Publish component archives from within VisualDSP++. VCSE supports component implementation in C/C++ or assembly language.

Use the Expert Linker to visually manipulate the placement of code and data on the embedded system. View memory utilization in a color-coded graphical form, easily move code and data to different areas of the processor or external memory with the drag of the mouse, examine run time stack and heap usage. The Expert Linker is fully compatible with the existing Linker Definition File (LDF), allowing the developer to move between the graphical and textual environments.

In addition to the software and hardware development tools available from Analog Devices, third parties provide a wide range of tools supporting the SHARC processor family. Hardware tools include SHARC processor PC plug-in cards. Third party software tools include DSP libraries, real-time operating systems, and block diagram design tools.

Designing an Emulator-Compatible DSP Board (Target)

The Analog Devices family of emulators are tools that every DSP developer needs to test and debug hardware and software systems. Analog Devices has supplied an IEEE 1149.1 JTAG Test Access Port (TAP) on each JTAG DSP. Nonintrusive in-circuit emulation is assured by the use of the processor's JTAG interface—the emulator does not affect target system loading or timing. The emulator uses the TAP to access the internal features of the processor, allowing the developer to load code, set breakpoints, observe variables, observe memory, and examine registers. The processor must be halted to send data and commands, but once an operation has been completed by the emulator, the DSP system is set running at full speed with no impact on system timing.

To use these emulators, the target board must include a header that connects the DSP's JTAG port to the emulator.

For details on target board design issues including mechanical layout, single processor connections, signal buffering, signal termination, and emulator pod logic, see the *EE-68: Analog Devices JTAG Emulation Technical Reference* on the Analog Devices website (www.analog.com)—use site search on “EE-68.” This document is updated regularly to keep pace with improvements to emulator support.

Evaluation Kit

Analog Devices offers a range of EZ-KIT Lite evaluation platforms to use as a cost effective method to learn more about developing or prototyping applications with Analog Devices processors, platforms, and software tools. Each EZ-KIT Lite includes an evaluation board along with an evaluation suite of

the VisualDSP++ development and debugging environment with the C/C++ compiler, assembler, and linker. Also included are sample application programs, power supply, and a USB cable. All evaluation versions of the software tools are limited for use only with the EZ-KIT Lite product.

The USB controller on the EZ-KIT Lite board connects the board to the USB port of the user's PC, enabling the VisualDSP++ evaluation suite to emulate the on-board processor in-circuit. This permits the customer to download, execute, and debug programs for the EZ-KIT Lite system. It also allows in-circuit programming of the on-board Flash device to store user-specific boot code, enabling the board to run as a stand-alone unit without being connected to the PC.

With a full version of VisualDSP++ installed (sold separately), engineers can develop software for the EZ-KIT Lite or any custom defined system. Connecting one of Analog Devices JTAG emulators to the EZ-KIT Lite board enables high-speed, non-intrusive emulation.

ADDITIONAL INFORMATION

This data sheet provides a general overview of the ADSP-21371 architecture and functionality. For detailed information on the ADSP-2137x Family core architecture and instruction set, refer to the *ADSP-2136x SHARC Processor Programming Reference*.

PIN FUNCTION DESCRIPTIONS

The following symbols appear in the Type column of [Table 5](#):

A = asynchronous, I = input, O = output, S = synchronous,
(A/D) = active drive, (O/D) = open drain, and T = three-state,
(pd) = pull-down resistor, (pu) = pull-up resistor.

Table 5. Pin List

Name	Type	State During and After Reset	Description
ADDR ₂₃₋₀	O/T (pu)	Pulled high/driven low	External Address. The ADSP-21371 outputs addresses for external memory and peripherals on these pins.
DATA ₃₁₋₀	I/O (pu)	Pulled high/pulled high	External Data. The data pins can be multiplexed to support the external memory interface data (I/O), the PDAP (I), and FLAGS (I/O). After reset, all DATA pins are in EMIF mode and FLAG(0-3) pins will be in FLAGS mode (default). When configured in the IDP_PDAP_CTL register, IDP channel 0 scans the DATA ₁₅₋₈ pins for parallel input data.
DAI_P ₂₀₋₁	I/O with programmable pu ¹	Pulled high/pulled high	Digital Applications Interface Pins. These pins provide the physical interface to the DAI SRU. The DAI SRU configuration registers define the combination of on-chip audio centric peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determines the exact behavior of the pin. Any input or output signal present in the DAI SRU may be routed to any of these pins. The DAI SRU provides the connection from the serial ports (4), the input data ports (2), and the precision clock generators (4), to the DAI_P ₂₀₋₁ pins.
DPI_P ₁₄₋₁	I/O with programmable pu ¹	Pulled high/pulled high	Digital Peripheral Interface. These pins provide the physical interface to the DPI SRU. The DPI SRU configuration registers define the combination of on-chip peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determines the exact behavior of the pin. Any input or output signal present in the DPI SRU may be routed to any of these pins. The DPI SRU provides the connection from the timers (2), SPIs (2), UART (1), flags (12), and general-purpose I/O (9) to the DPI_P ₁₄₋₁ pins.
ACK	I (pu)		Memory Acknowledge. External devices can deassert ACK (low) to add wait states to an external memory access. ACK is used by I/O devices, memory controllers, or other peripherals to hold off completion of an external memory access.
\overline{RD}	O/T (pu)	Pulled high/driven high	External Port Read Enable. \overline{RD} is asserted whenever the ADSP-21371 reads a word from external memory. \overline{RD} has a 22.5 k Ω internal pull-up resistor.
\overline{WR}	O/T (pu)	Pulled high/driven high	External Port Write Enable. \overline{WR} is asserted when the ADSP-21371 writes a word to external memory. \overline{WR} has a 22.5 k Ω internal pull-up resistor.
\overline{SDRAS}	O/T (pu)	Pulled high/driven high	SDRAM Row Address Strobe. Connect to SDRAM's RAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform.
\overline{SDCAS}	O/T (pu)	Pulled high/driven high	SDRAM Column Address Select. Connect to SDRAM's CAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform.
\overline{SDWE}	O/T (pu)	Pulled high/driven high	SDRAM Write Enable. Connect to SDRAM's WE or W buffer pin.
\overline{SDCKE}	O/T (pu)	Pulled high/driven high	SDRAM Clock Enable. Connect to SDRAM's CKE pin. Enables and disables the CLK signal. For details, see the data sheet supplied with the SDRAM device.
SDA10	O/T (pu)	Pulled high/driven low	SDRAM A10 Pin. Enables applications to refresh an SDRAM in parallel with a non-SDRAM accesses. This pin replaces the DSP's A10 pin only during SDRAM accesses.
$\overline{SDCLK0}$	O/T	High-Z/driving	SDRAM Clock Output 0.
\overline{MS}_{0-1}	O		Memory Select Lines 0–1. These lines are asserted (low) as chip selects for the corresponding banks of external memory. The \overline{MS}_{3-0} lines are decoded memory address lines that change at the same time as the other address lines. When no external memory access is occurring the \overline{MS}_{3-0} lines are inactive; they are active however when a conditional memory access instruction is executed, whether or not the condition is true. The $\overline{MS1}$ pin can be used in EPORT/FLASH boot mode. See the hardware reference for more information.
FLAG[0]/IRQ0	I/O (pu)	Pulled high/driven high	FLAG0/Interrupt Request0.

Table 5. Pin List

Name	Type	State During and After Reset	Description
FLAG[1]/IRQ1	I/O	High-Z/high-Z	FLAG1/Interrupt Request1.
FLAG[2]/IRQ2/ MS2	I/O	High-Z/high-Z	FLAG2/Interrupt Request/Memory Select2.
FLAG[3]/TIMEXP/M S3	I/O with programmable pu (for MS mode)	High-Z/high-Z	FLAG3/Timer Expired/Memory Select3.
TDI	Input with programmable pu (for MS mode)		Test Data Input (JTAG). Provides serial data for the boundary scan logic. TDI has a 22.5 k Ω internal pull-up resistor.
TDO	O (pu)		Test Data Output (JTAG). Serial scan output of the boundary scan path.
TMS	I		Test Mode Select (JTAG). Used to control the test state machine. TMS has a 22.5 k Ω internal pull-up resistor.
TCK	I (pu)		Test Clock (JTAG). Provides a clock for JTAG boundary scan. TCK must be asserted (pulsed low) after power-up or held low for proper operation of the ADSP-21371.
TRST	I		Test Reset (JTAG). Resets the test state machine. TRST must be asserted (pulsed low) after power-up or held low for proper operation of the ADSP-21371. TRST has a 22.5 k Ω internal pull-up resistor.
EMU	O (pu)		Emulation Status. Must be connected to the ADSP-21371 Analog Devices DSP Tools product line of JTAG emulators target board connector only. EMU has a 22.5 k Ω internal pull-up resistor.
CLK_CFG1-0	I (pu)		Core/CLKIN Ratio Control. These pins set the start up clock frequency. See Table 8 for a description of the clock configuration modes. Note that the operating frequency can be changed by programming the PLL multiplier and divider in the PMCTL register at any time after the core comes out of reset.
BOOT_CFG1-0	I		Boot Configuration Select. These pins select the boot mode for the processor. The BOOTCFG pins must be valid before reset is asserted. See Table 7 for a description of the boot modes.
RESET	I		Processor Reset. Resets the ADSP-21371 to a known state. Upon deassertion, there is a 4096 CLKIN cycle latency for the PLL to lock. After this time, the core begins program execution from the hardware reset vector address. The RESET input must be asserted (low) at power-up.
XTAL	O		Crystal Oscillator Terminal. Used in conjunction with CLKIN to drive an external crystal.
CLKIN	I		Local Clock In. Used in conjunction with XTAL. CLKIN is the ADSP-21371 clock input. It configures the ADSP-21371 to use either its internal clock generator or an external clock source. Connecting the necessary components to CLKIN and XTAL enables the internal clock generator. Connecting the external clock to CLKIN while leaving XTAL unconnected configures the ADSP-21371 to use the external clock source such as an external clock oscillator. CLKIN may not be halted, changed, or operated below the specified frequency.
CLKOUT	O/T	Driven low/ driven high	Local Clock Out. CLKOUT can also be configured as a reset out pin. The functionality can be switched between the PLL output clock and reset out by setting bit 12 of the PMCTREG register. The default is reset out.

¹ Pull-up can be enabled/disabled, value of pull-up cannot be programmed.

DATA MODES

The upper 32 data pins of the external memory interface are muxed (using bits in the SYSCCTL register) to support the external memory interface data (input/output), the PDAP (input only), and the FLAGS (input/output). [Table 6](#) provides the pin settings.

Table 6. Function of Data Pins

DATA PIN MODE	DATA31–16	DATA15–8	DATA7–0
000	EPDATA32–0		
001	FLAGS/PWM15–0 ¹	EPDATA15–0	
010	FLAGS/PWM15–0 ¹	FLAGS15–8	EPDATA7–0
011	FLAGS/PWM15–0 ¹	FLAGS15–0	
100	PDAP (DATA + CTRL)		EPDATA7–0
101	PDAP (DATA + CTRL)		FLAGS7–0
110	Reserved		
111	Three-state all pins		

¹These signals can be FLAGS or PWM or a mix of both. However, they can be selected only in groups of four. Their function is determined by the control signals FLAGS/PWM_SEL. For more information, see the *ADSP-2136x SHARC Processor Hardware Reference for the ADSP-21367/8/9 Processors*.

BOOT MODES

00	6:1
01	32:1
10	16:1
11	Reserved

ADSP-21371 SPECIFICATIONS

OPERATING CONDITIONS

Parameter ¹		K Grade		Unit
		Min	Max	
V _{DDINT}	Internal (Core) Supply Voltage	1.14	1.26	V
V _{DDEXT}	External (I/O) Supply Voltage	3.13	3.47	V
V _{IH} ²	High Level Input Voltage @ V _{DDEXT} = max	2.0	V _{DDEXT} + 0.5	V
V _{IL} ³	Low Level Input Voltage @ V _{DDEXT} = min	−0.5	+0.8	V
V _{IH_CLKIN} ³	High Level Input Voltage @ V _{DDEXT} = max	1.74	V _{DDEXT} + 0.5	V
V _{IL_CLKIN}	Low Level Input Voltage @ V _{DDEXT} = min	−0.5	+1.19	V

¹ Specifications subject to change without notice.

² Applies to input and bidirectional pins: AD23−0, DATA16−0, FLAG3−0, DAI_Px, DPI_Px, $\overline{\text{SPIDS}}$, BOOTCFGx, CLKCFGx, $\overline{\text{RESET}}$, TCK, TMS, TDI, $\overline{\text{TRST}}$.

³ Applies to input pin CLKIN.

ELECTRICAL CHARACTERISTICS

Parameter ¹		Test Conditions	Min	Max	Unit
V _{OH} ²	High Level Output Voltage	@ V _{DDEXT} = min, I _{OH} = −1.0 mA ³	2.4		V
V _{OL} ²	Low Level Output Voltage	@ V _{DDEXT} = min, I _{OL} = 1.0 mA ³		0.4	V
I _{IH} ^{4,5}	High Level Input Current	@ V _{DDEXT} = max, V _{IN} = V _{DDEXT} max		10	μA
I _{IL} ⁴	Low Level Input Current	@ V _{DDEXT} = max, V _{IN} = 0 V		10	μA
I _{ILPU} ⁵	Low Level Input Current Pull-up	@ V _{DDEXT} = max, V _{IN} = 0 V		200	μA
I _{OZH} ^{6,7}	Three-State Leakage Current	@ V _{DDEXT} = max, V _{IN} = V _{DDEXT} max		10	μA
I _{OZL} ⁶	Three-State Leakage Current	@ V _{DDEXT} = max, V _{IN} = 0 V		10	μA
I _{OZLPU} ⁷	Three-State Leakage Current Pull-up	@ V _{DDEXT} = max, V _{IN} = 0 V		200	μA
I _{DD-INTYP} ^{8,9}	Supply Current (Internal)	t _{CCLK} = 5.0 ns, V _{DDINT} = 1.2		500	mA
C _{IN} ^{10,11}	Input Capacitance	f _{IN} = 1 MHz, T _{CASE} = 25°C, V _{IN} = 1.3V		4.7	pF

¹ Specifications subject to change without notice.

² Applies to output and bidirectional pins: ADDR23−0, DATA16−0, $\overline{\text{RD}}$, $\overline{\text{WR}}$, FLAG3−0, DAI_Px, DPI_Px, $\overline{\text{EMU}}$, TDO, CLKOUT, XTAL.

³ See [Output Drive Currents on Page 43](#) for typical drive current capabilities.

⁴ Applies to input pins: BOOTCFGx, CLKCFGx, TCK, $\overline{\text{RESET}}$, CLKIN.

⁵ Applies to input pins with 22.5 kΩ internal pull-ups: $\overline{\text{TRST}}$, TMS, TDI.

⁶ Applies to three-statable pins: FLAG3−0.

⁷ Applies to three-statable pins with 22.5 kΩ pull-ups: DAI_Px, DPI_Px, $\overline{\text{EMU}}$.

⁸ Typical internal current data reflects nominal operating conditions.

⁹ See Engineer-to-Engineer Note (No. TBD) for further information.

¹⁰ Applies to all signal pins.

¹¹ Guaranteed, but not tested.

PACKAGE INFORMATION

The information presented in [Figure 2](#) provides details about the package branding for the ADSP-21371 processor. For a complete listing of product availability, see [Ordering Guide on Page 47](#).

Figure 2. Typical Package Brand

Table 9. Package Brand Information

Brand Key	Field Description
t	Temperature Range
pp	Package Type
Z	Lead Free Option (optional)
ccc	See Ordering Guide
vvvvvv.x	Assembly Lot Code
n.n	Silicon Revision
yyww	Date Code

ESD SENSITIVITY

CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000V readily accumulate on the human body and test equipment and can discharge without detection. Although the ADSP-21371 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

MAXIMUM POWER DISSIPATION

See Engineer-to-Engineer Note (EE-TBD) for detailed thermal and power information regarding maximum power dissipation. For information on package thermal specifications, see [Thermal Characteristics on Page 44](#).

ABSOLUTE MAXIMUM RATINGS

Stresses greater than those listed in [Table 10](#) may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions greater than those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 10. Absolute Maximum Ratings

Parameter	Rating
Internal (Core) Supply Voltage (V_{DDINT})	-0.3 V to +1.5 V
Analog (PLL) Supply Voltage (A_{VDD})	-0.3 V to +1.5 V
External (I/O) Supply Voltage (V_{DDEXT})	-0.3 V to +4.6 V
Input Voltage -0.5 V to V_{DDEXT}	+0.5 V
Output Voltage Swing -0.5 V to V_{DDEXT}	+0.5 V
Load Capacitance	200 pF
Storage Temperature Range	-65°C to +150°C
Junction Temperature under Bias	125°C

TIMING SPECIFICATIONS

The ADSP-21371's internal clock (a multiple of CLKIN) provides the clock signal for timing internal memory, processor core, and serial ports. During reset, program the ratio between the processor's internal clock frequency and external (CLKIN) clock frequency with the CLKCFG1–0 pins (see [Table 8 on](#)

[page 14](#)). To determine switching frequencies for the serial ports, divide down the internal clock, using the programmable divider control of each port (DIVx for the serial ports).

[Figure 3](#) shows core to CLKIN ratios of 6:1, 16:1 and 32:1 with external oscillator or crystal. Note that more ratios are possible and can be set through software using the power management control register (PMCTL). For more information, see the *ADSP-2136x SHARC Processor Programming Reference*.

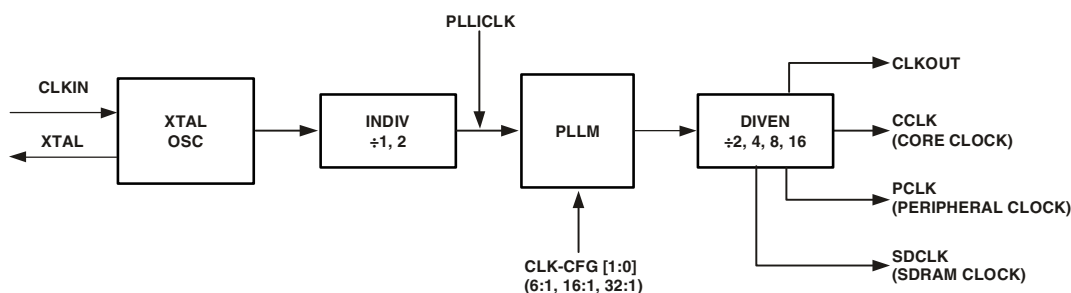

Figure 3. Core Clock and System Clock Relationship to CLKIN

The ADSP-21371's internal clock switches at higher frequencies than the system input clock (CLKIN). To generate the internal clock, the processor uses an internal phase-locked loop (PLL). This PLL-based clocking minimizes the skew between the system clock (CLKIN) signal and the processor's internal clock.

Note the definitions of various clock periods shown in [Table 12](#) which are a function of CLKIN and the appropriate ratio control shown in [Table 11](#).

Table 11. ADSP-21371 CLKOUT and CCLK Clock Generation Operation

Timing Requirements	Description	Calculation
CLKIN	Input Clock	$1/t_{CK}$
CCLK	Core Clock	$1/t_{CCLK}$

Table 12. Clock Periods

Timing Requirements	Description ¹
t_{CK}	CLKIN Clock Period
t_{CCLK}	(Processor) Core Clock Period
t_{PCLK}	(Peripheral) Clock Period = $2 \times t_{CCLK}$
t_{SCLK}	Serial Port Clock Period = $(t_{PCLK}) \times SR$
t_{SDCLK}	SDRAM Clock Period = $(t_{CCLK}) \times SDR$
t_{SPICLK}	SPI Clock Period = $(t_{PCLK}) \times SPIR$

¹ where:

SR = serial port-to-core clock ratio (wide range, determined by SPORT CLKDIV bits in DIVx register)

SPIR = SPI-to-Core Clock Ratio (wide range, determined by SPIBAUD register setting)

SDR=SDRAM-to-Core Clock Ratio (Values determined by bits 20-18 of the PMCTL register)

Use the exact timing information given. Do not attempt to derive parameters from the addition or subtraction of others. While addition or subtraction would yield meaningful results for an individual device, the values given in this data sheet reflect statistical variations and worst cases. Consequently, it is not meaningful to add parameters to derive longer times. See [Figure 34 on page 43](#) under Test Conditions for voltage reference levels.

Switching Characteristics specify how the processor changes its signals. Circuitry external to the processor must be designed for compatibility with these signal characteristics. Switching characteristics describe what the processor will do in a given circumstance. Use switching characteristics to ensure that any timing requirement of a device connected to the processor (such as memory) is satisfied.

Timing Requirements apply to signals that are controlled by circuitry external to the processor, such as the data input for a read operation. Timing requirements guarantee that the processor operates correctly with other devices.

Power-Up Sequencing

The timing requirements for processor startup are given in [Table 13](#).

Table 13. Power Up Sequencing Timing Requirements (Processor Startup)

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{RSTVDD}	\overline{RESET} Low Before V_{DDINT}/V_{DDEXT} On	0		ns
$t_{IVDDEVDD}$	V_{DDINT} on Before V_{DDEXT}	-50	200	ms
t_{CLKVDD}^1	CLKIN Valid After V_{DDINT}/V_{DDEXT} Valid	0	200	ms
t_{CLKRST}	CLKIN Valid Before \overline{RESET} Deasserted	10^2		μs
t_{PLLRST}	PLL Control Setup Before \overline{RESET} Deasserted	20^3		μs
<i>Switching Characteristic</i>				
$t_{CORERST}$	Core Reset Deasserted After \overline{RESET} Deasserted	$4096t_{CK} + 2t_{CCLK}^{4,5}$		

¹Valid V_{DDINT}/V_{DDEXT} assumes that the supplies are fully ramped to their 1.2 and 3.3 volt rails. Voltage ramp rates can vary from microseconds to hundreds of milliseconds depending on the design of the power supply subsystem.

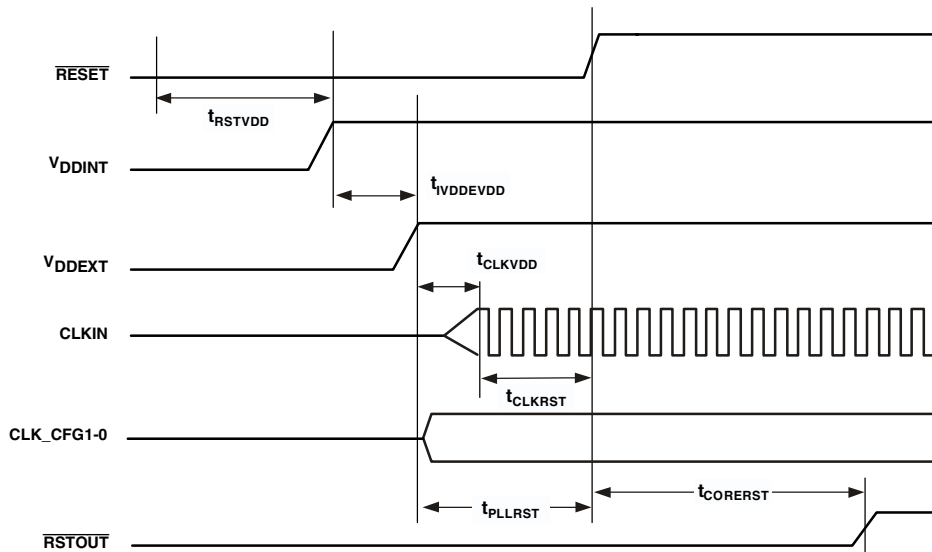

²Assumes a stable CLKIN signal, after meeting worst-case startup timing of crystal oscillators. Refer to your crystal oscillator manufacturer's datasheet for startup time.

Assume a 25 ms maximum oscillator startup time if using the XTAL pin and internal oscillator circuit in conjunction with an external crystal.

³Based on CLKIN cycles

⁴Applies after the power-up sequence is complete. Subsequent resets require a minimum of four CLKIN cycles for \overline{RESET} to be held low in order to properly initialize and propagate default states at all I/O pins.

⁵The 4096 cycle count depends on t_{SRST} specification in [Table 15](#). If setup time is not met, one additional CLKIN cycle may be added to the core reset time, resulting in 4097 cycles maximum.

**Figure 4. Power-Up Sequencing**

Clock Input

Table 14. Clock Input

Parameter		266 MHz		Unit
		Min	Max	
Timing Requirements				
t _{CK}	CLKIN Period	22.5 ¹	320 ²	ns
t _{CKL}	CLKIN Width Low	9 ¹	150 ²	ns
t _{CKH}	CLKIN Width High	9 ¹	150 ²	ns
t _{CKRF}	CLKIN Rise/Fall (0.4V–2.0V)		TBD	ns
t _{CCLK} ³	CCLK Period	3.75 ¹	10	ns

¹ Applies only for CLKCFG1–0 = 00 and default values for PLL control bits in PMCTL.

² Applies only for CLKCFG1–0 = 01 and default values for PLL control bits in PMCTL.

³ Any changes to PLL control bits in the PMCTL register must meet core clock timing specification t_{CCLK} .

Figure 5. Clock Input

Clock Signals

The ADSP-21371 can use an external clock or a crystal. See the CLKIN pin description in Table 5. The programmer can configure the ADSP-21371 to use its internal clock generator by connecting the necessary components to CLKIN and XTAL. Figure 6 shows the component connections used for a crystal operating in fundamental mode. Note that the clock rate is achieved using a 16.67 MHz crystal and a PLL multiplier ratio 16:1 (CCLK:CLKIN achieves a clock speed of 266 MHz). To achieve the full core clock rate, programs need to configure the multiplier bits in the PMCTL register.

R2 SHOULD BE CHOSEN TO LIMIT CRYSTAL DRIVE POWER. REFER TO CRYSTAL MANUFACTURER'S SPECIFICATIONS

*TYPICAL VALUES

Figure 6. 266 MHz Operation (Fundamental Mode Crystal)

Reset

Table 15. Reset

Parameter	Min	Max	Unit
Timing Requirements			
t_{WRST}^1 \overline{RESET} Pulse Width Low	$4t_{CK}$		ns
t_{SRST} \overline{RESET} Setup Before CLKIN Low	8		ns

¹ Applies after the power-up sequence is complete. At power-up, the processor’s internal phase-locked loop requires no more than 100 μ s while \overline{RESET} is low, assuming stable VDD and CLKIN (not including start-up time of external clock oscillator).

Figure 7. Reset

Interrupts

The following timing specification applies to the FLAG0, FLAG1, and FLAG2 pins when they are configured as $\overline{IRQ0}$, $\overline{IRQ1}$, and $\overline{IRQ2}$ interrupts.

Table 16. Interrupts

Parameter	Min	Max	Unit
Timing Requirement			
t_{IPW} \overline{IRQx} Pulse Width	$2 \times t_{PCLK} + 2$		ns

Figure 8. Interrupts

Core Timer

The following timing specification applies to FLAG3 when it is configured as the core timer (CTIMER).

Table 17. Core Timer

Parameter	Min	Max	Unit
<i>Switching Characteristic</i>			
t_{WCTIM} CTIMER Pulse width	$4 \times t_{PCLK} - 1$		ns

Figure 9. Core Timer

Timer WDT_H_CAP Timing

The following timing specification applies to timer0, and timer1, and in WDT_H_CAP (pulse width count and capture) mode. Timer signals are routed to the DPI_P14-1 pins through the SRU. Therefore, the timing specification provided below is valid at the DPI_P14-1 pins.

Table 18. Timer Width Capture Timing

Parameter	Min	Max	Unit
<i>Timing Requirement</i>			
t_{PWI} Timer Pulse Width	$2 t_{PCLK}$	$2(2^{31} - 1) t_{PCLK}$	ns

Figure 10. Timer Width Capture Timing

Pin to Pin Direct Routing (DAI and DPI)

For direct pin connections only (for example DAI_PB01_I to DAI_PB02_O).

Table 19. DAI Pin to Pin Routing

Parameter	Min	Max	Unit
Timing Requirement			
t _{DPIO} Delay DAI/DPI Pin Input Valid to DAI Output Valid	1.5	10	ns

Figure 11. DAI Pin to Pin Direct Routing

Precision Clock Generator (Direct Pin Routing)

This timing is only valid when the SRU is configured such that the precision clock generator (PCG) takes its inputs directly from the DAI pins (via pin buffers) and sends its outputs directly to the DAI pins. For the other cases, where the PCG's

inputs and outputs are not directly routed to/from DAI pins (via pin buffers) there is no timing data available. All timing parameters and switching characteristics apply to external DAI pins (DAI_P01 – DAI_P20).

Table 20. Precision Clock Generator (Direct Pin Routing)

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{PCGIW} Input Clock Period	30		ns
t_{STRIG} PCG Trigger Setup Before Falling Edge of PCG Input Clock	2		ns
t_{HTRIG} PCG Trigger Hold After Falling Edge of PCG Input Clock	2		ns
<i>Switching Characteristics</i>			
t_{DPCGIO} PCG Output Clock and Frame Sync Active Edge Delay After PCG Input Clock	2.5	10	ns
$t_{DTRIGCLK}$ PCG Output Clock Delay After PCG Trigger	$2.5 + ((2.5 + D) \times t_{PCGIW})$	$10 + ((2.5 + D) \times t_{PCGIW})$	ns
$t_{DTRIGFS}$ PCG Frame Sync Delay After PCG Trigger	$2.5 + ((2.5 + D - PH) \times t_{PCGIW})$	$10 + ((2.5 + D - PH) \times t_{PCGIW})$	ns
t_{PCGOW} Output Clock Period	$2 \times t_{PCGIW}^1$		ns

$D = FSxDIV$, $PH = FSxPHASE$.

¹Normal mode of operation.

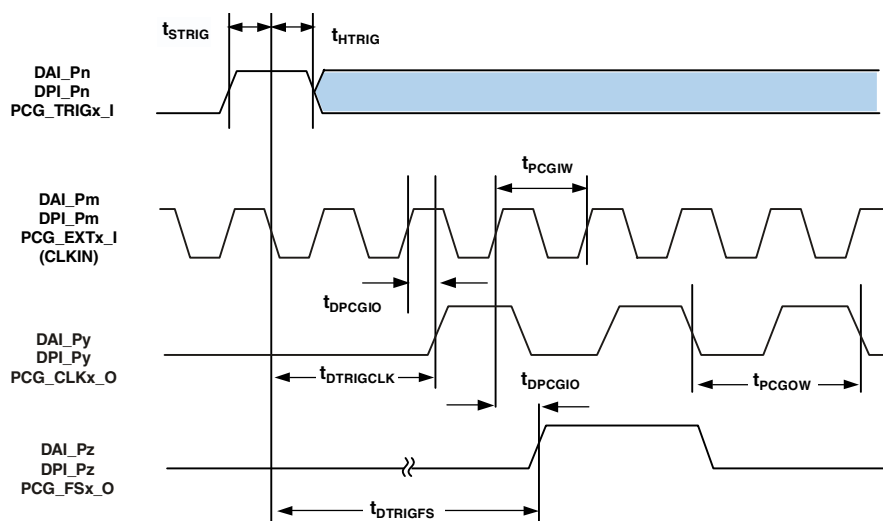

Figure 12. Precision Clock Generator (Direct Pin Routing)

Flags

The timing specifications provided below apply to the FLAG3-0 and DPI_P14-1 pins, and the serial peripheral interface (SPI). See Table 5 for more information on flag use.

Table 21. Flags

Parameter	Min	Max	Unit
<i>Timing Requirement</i>			
t_{FIPW} FLAG3-0 IN Pulse Width	$2 \times t_{PCLK} + 3$		ns
<i>Switching Characteristic</i>			
t_{FOPW} FLAG3-0 OUT Pulse Width	$2 \times t_{PCLK} - 1$		ns

Figure 13. Flags

SDRAM Interface Timing (133 MHz SDCLK)**Table 22. SDRAM Interface Timing¹**

Parameter		Min	Max	Unit
<i>Timing Requirement</i>				
t_{SSDAT}	DATA Setup Before SDCLK	0.0		ns
t_{HSDAT}	DATA Hold After SDCLK	1.0		ns
<i>Switching Characteristic</i>				
t_{SDCLK}	SDCLK Period	7.5		ns
t_{SDCLKH}	SDCLK Width High	3.65		ns
t_{SDCLKL}	SDCLK Width Low	3.65		ns
t_{DCAD}	Command, ADDR, Data Delay After SDCLK ²		4.0	ns
t_{HCAD}	Command, ADDR, Data Hold After SDCLK ²	1.5		ns
t_{DSDAT}	Data Disable After SDCLK		5.3	ns
t_{ENSDAT}	Data Enable After SDCLK	2.6		ns

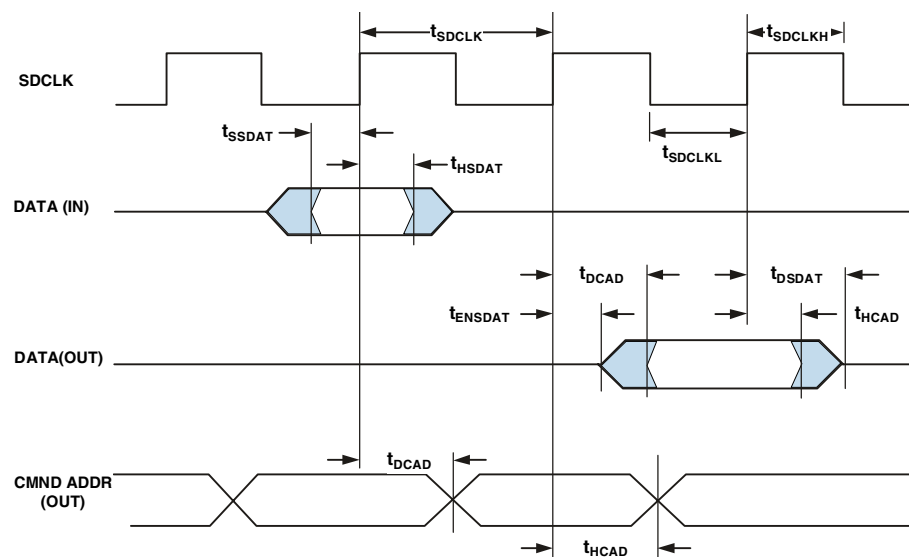

¹ For $F_{CLK} = 133$ MHz (SDCLK ratio = 1:2).² Command pins include: \overline{SDCAS} , \overline{SDRAS} , \overline{SDWE} , \overline{MSx} , SDA10, and SDCKE.NOTE: COMMAND = \overline{SDCAS} , \overline{SDRAS} , \overline{SDWE} , \overline{MSx} , SDA10, SDCKE.

Figure 14. SDRAM Interface Timing for 133 MHz SDCLK

Memory Read – Bus Master

Use these specifications for asynchronous interfacing to memories. Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only apply to asynchronous access mode.

Table 23. Memory Read – Bus Master

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{DAD} Address, Selects Delay to Data Valid ^{1,2}		$W + t_{SDCLK} - 5.12$	ns
t_{DRLD} \overline{RD} Low to Data Valid ¹		$W - 1.5 + t_{SDCLK}$	ns
t_{SDS} Data Setup to \overline{RD} High	1.79		ns
t_{HDRH} Data Hold from \overline{RD} High ^{3,4}	0		ns
t_{DAAK} ACK Delay from Address, Selects ^{2,5}		$t_{SDCLK} - 9.5 + W$	ns
t_{DSAK} ACK Delay from \overline{RD} Low ⁴		$W - 7.0$	ns
t_{HAKC} ACK Hold After \overline{RD} High	0		ns
<i>Switching Characteristics</i>			
t_{DRHA} Address Selects Hold After \overline{RD} High	$RH + 0.44$		ns
t_{DARL} Address Selects to \overline{RD} Low ²	$t_{SDCLK} - 3.3$		ns
t_{RW} \overline{RD} Pulsewidth	$W - 0.5$		ns
t_{RWR} \overline{RD} High to \overline{WR} , \overline{RD} , Low	$HI + t_{SDCLK}$		ns

W = (number of wait states specified in AMICTLx register) $\times t_{SDCLK}$.

HI = $RHC + IC$ (RHC = (number of Read Hold Cycles specified in AMICTLx register) $\times t_{SDCLK}$).

IC = (number of Idle Cycles specified in AMICTLx register) $\times t_{SDCLK}$.

H = (number of Hold Cycles specified in AMICTLx register) $\times t_{SDCLK}$.

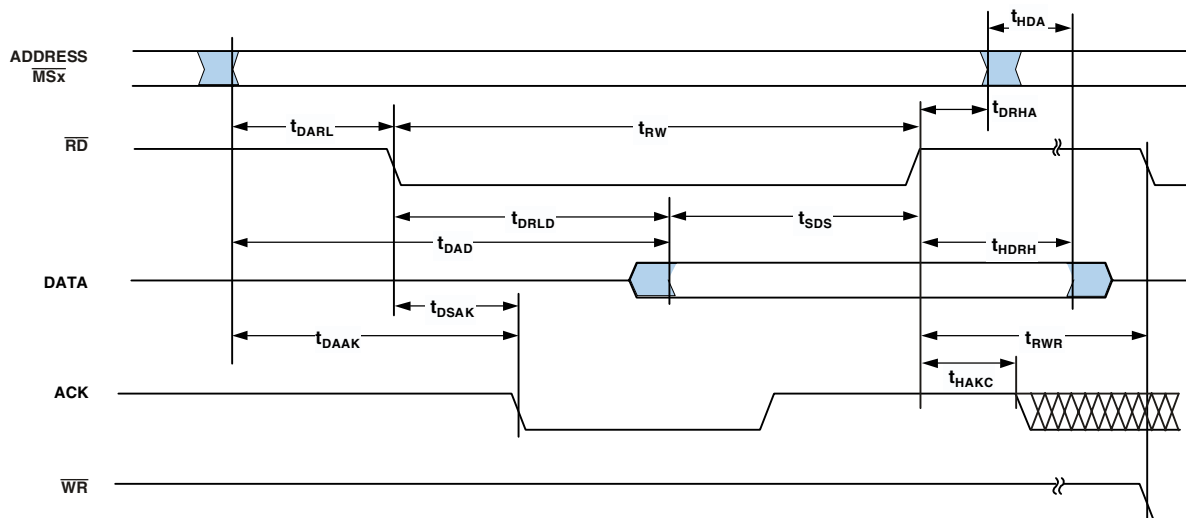

¹ Data Delay/Setup: System must meet t_{DAD} , t_{DRLD} , or t_{SDS} .

² The falling edge of \overline{MSx} , is referenced.

³ Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only apply to asynchronous access mode.

⁴ Data Hold: User must meet t_{HDA} or t_{HDRH} in asynchronous access mode. See [Test Conditions on Page 43](#) for the calculation of hold times given capacitive and dc loads.

⁵ ACK Delay/Setup: User must meet t_{DAAK} , or t_{DSAK} , for deassertion of ACK (low). For asynchronous assertion of ACK (high) user must meet t_{DAAK} or t_{DSAK} .

**Figure 15. Memory Read – Bus Master**

Memory Write – Bus Master

Use these specifications for asynchronous interfacing to memories. Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only apply to asynchronous access mode.

Table 24. Memory Write – Bus Master

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{DAAK} ACK Delay from Address, Selects ^{1,2}		$t_{SDCLK} - 9.7 + W$	ns
t_{DSAK} ACK Delay from \overline{WR} Low ^{1,3}		$W - 7.1$	ns
t_{HAKC} ACK Hold After \overline{WR} High ¹	0		ns
<i>Switching Characteristics</i>			
t_{DAWH} Address, Selects to \overline{WR} Deasserted ²	$t_{SDCLK} - 3.1 + W$		ns
t_{DAWL} Address, Selects to \overline{WR} Low ²	$t_{SDCLK} - 2.7$		ns
t_{WW} \overline{WR} Pulsewidth	$W - 0.4$		ns
t_{DDWH} Data Setup Before \overline{WR} High	$t_{SDCLK} - 2.1 + W$		ns
t_{DWHA} Address Hold After \overline{WR} Deasserted	$H + 0.3$		ns
t_{DWHD} Data Hold After \overline{WR} Deasserted	$H + 0.4$		ns
t_{DATRWH} Data Disable After \overline{WR} Deasserted ⁴	$t_{SDCLK} - 1.37 + H$	$t_{SDCLK} + 3.9 + H$	ns
t_{WWR} \overline{WR} High to \overline{RD} , \overline{RD} Low	$t_{SDCLK} - 0.2 + H$		ns
t_{DDWR} Data Disable Before \overline{RD} Low	$2t_{SDCLK} - 4.11$		ns
t_{WDE} \overline{WR} Low to Data Enabled	$t_{SDCLK} - 3.5$		ns

$W = (\text{number of wait states specified in AMICTLx register}) \times t_{SDCLK}$

$H = (\text{number of hold cycles specified in AMICTLx register}) \times t_{SDCLK}$

¹ ACK Delay/Setup: System must meet t_{DAAK} , or t_{DSAK} , for deassertion of ACK (low). For asynchronous assertion of ACK (high) user must meet t_{DAAK} or t_{DSAK} .

² The falling edge of \overline{MSx} is referenced.

³ Note that timing for ACK, DATA, \overline{RD} , \overline{WR} , and strobe timing parameters only applies to asynchronous access mode.

⁴ See [Test Conditions on Page 43](#) for calculation of hold times given capacitive and dc loads.

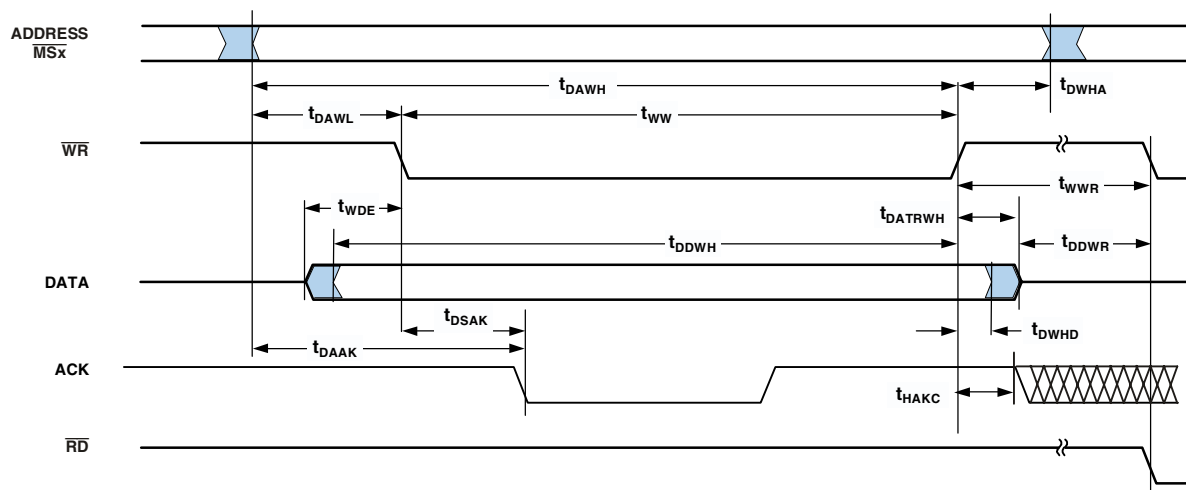

Figure 16. Memory Write – Bus Master

Serial Ports

To determine whether communication is possible between two devices at clock speed n , the following specifications must be confirmed: 1) frame sync delay and frame sync setup and hold, 2) data delay and data setup and hold, and 3) SCLK width.

Serial port signals (SCLK, FS, data channel A, data channel B) are routed to the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20–1 pins.

Table 25. Serial Ports—External Clock

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SFSE}^1 FS Setup Before SCLK (Externally Generated FS in either Transmit or Receive Mode)	2.5		ns
t_{HFSE}^1 FS Hold After SCLK (Externally Generated FS in either Transmit or Receive Mode)	2.5		ns
t_{SDRE}^1 Receive Data Setup Before Receive SCLK	2.5		ns
t_{HDRE}^1 Receive Data Hold After SCLK	2.5		ns
t_{SCLKW} SCLK Width	15		ns
t_{SCLK} SCLK Period	30		ns
<i>Switching Characteristics</i>			
t_{DFSE}^2 FS Delay After SCLK (Internally Generated FS in either Transmit or Receive Mode)		7	ns
t_{HOFSE}^2 FS Hold After SCLK (Internally Generated FS in either Transmit or Receive Mode)	2		ns
t_{DDTE}^2 Transmit Data Delay After Transmit SCLK		7	ns
t_{HDTE}^2 Transmit Data Hold After Transmit SCLK	2		ns

¹Referenced to sample edge.

²Referenced to drive edge.

Table 26. Serial Ports—Internal Clock

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SFSI}^1 FS Setup Before SCLK (Externally Generated FS in either Transmit or Receive Mode)	7		ns
t_{HFSI}^1 FS Hold After SCLK (Externally Generated FS in either Transmit or Receive Mode)	2.5		ns
t_{SDRI}^1 Receive Data Setup Before SCLK	7		ns
t_{HDRI}^1 Receive Data Hold After SCLK	2.5		ns
<i>Switching Characteristics</i>			
t_{DFSI}^2 FS Delay After SCLK (Internally Generated FS in Transmit Mode)		3	ns
t_{HOFSI}^2 FS Hold After SCLK (Internally Generated FS in Transmit Mode)	–1.0		ns
t_{DFSI}^2 FS Delay After SCLK (Internally Generated FS in Receive Mode)		3	ns
t_{HOFSI}^2 FS Hold After SCLK (Internally Generated FS in Receive Mode)	–1.0		ns
t_{DDTI}^2 Transmit Data Delay After SCLK		3	ns
t_{HDTI}^2 Transmit Data Hold After SCLK	–1.0		ns
t_{SCLKIW} Transmit or Receive SCLK Width	$0.5t_{SCLK} - 2$	$0.5t_{SCLK} + 2$	ns

¹Referenced to the sample edge.

²Referenced to drive edge.

Table 27. Serial Ports—Enable and Three-State

Parameter	Min	Max	Unit
<i>Switching Characteristics</i>			
t_{DDTEN}^1 Data Enable from External Transmit SCLK	2		ns
t_{DDTTE}^1 Data Disable from External Transmit SCLK		7	ns
t_{DDTIN}^1 Data Enable from Internal Transmit SCLK	–1		ns

¹Referenced to drive edge.

Table 28. Serial Ports—External Late Frame Sync

Parameter	Min	Max	Unit
<i>Switching Characteristics</i>			
$t_{DDTLFSE}^1$ Data Delay from Late External Transmit FS or External Receive FS with MCE = 1, MFD = 0		7	ns
$t_{DDTENFS}^1$ Data Enable for MCE = 1, MFD = 0	0.5		ns

¹The $t_{DDTLFSE}$ and $t_{DDTENFS}$ parameters apply to Left-justified Sample Pair as well as DSP serial mode, and MCE = 1, MFD = 0.

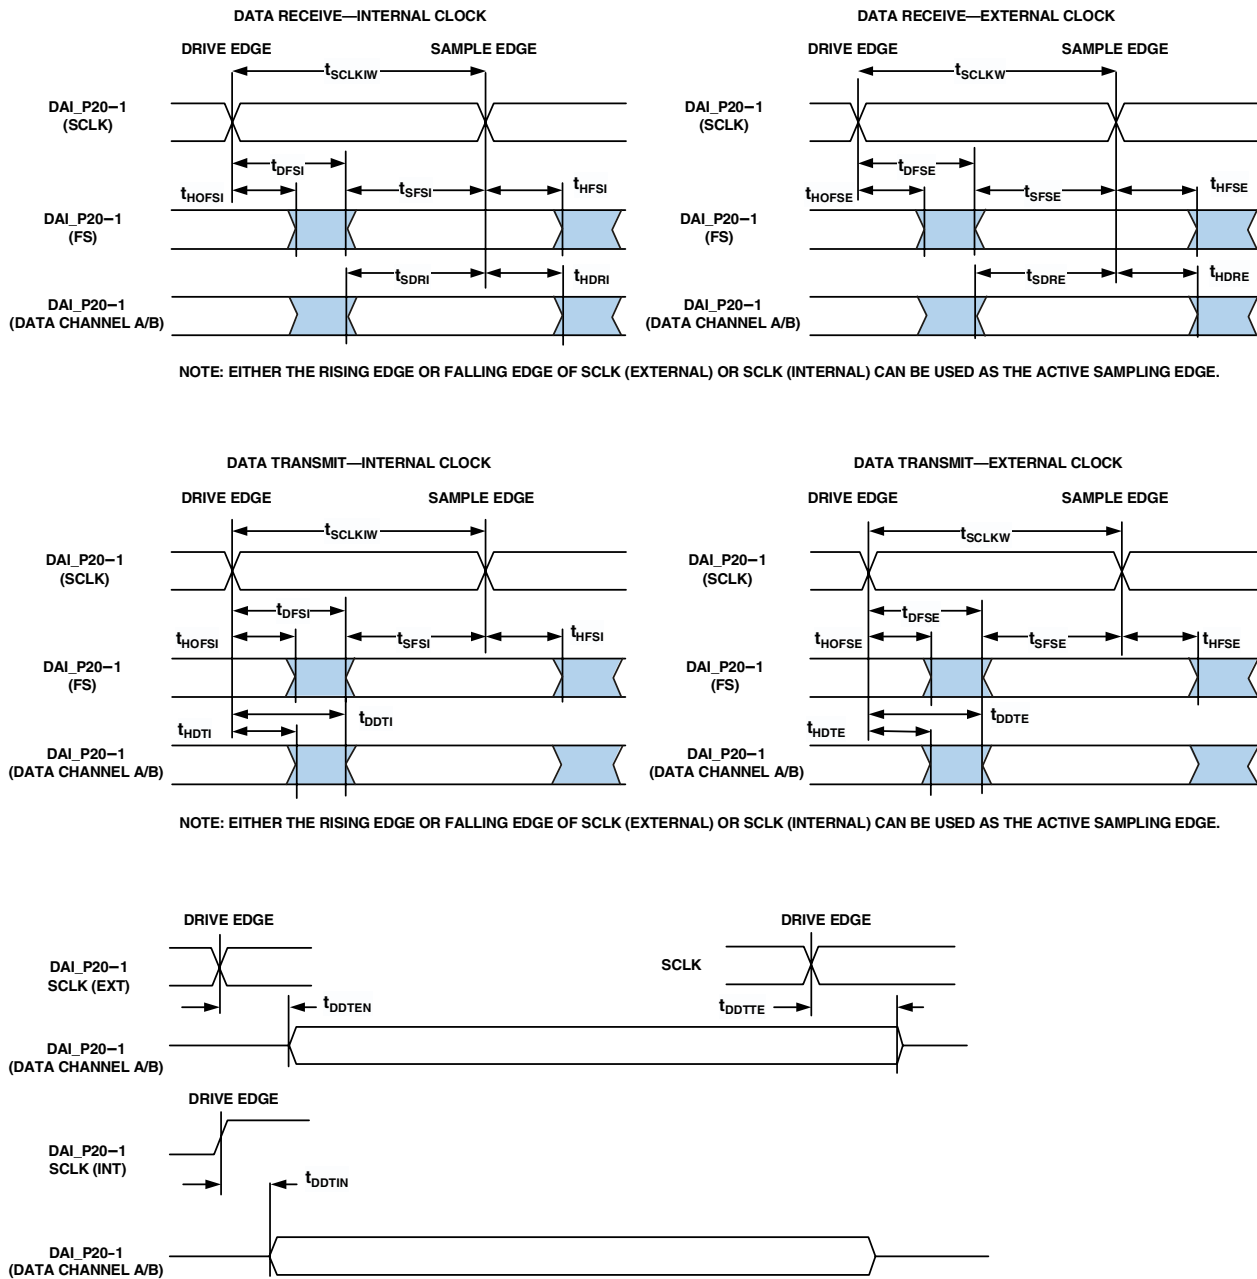

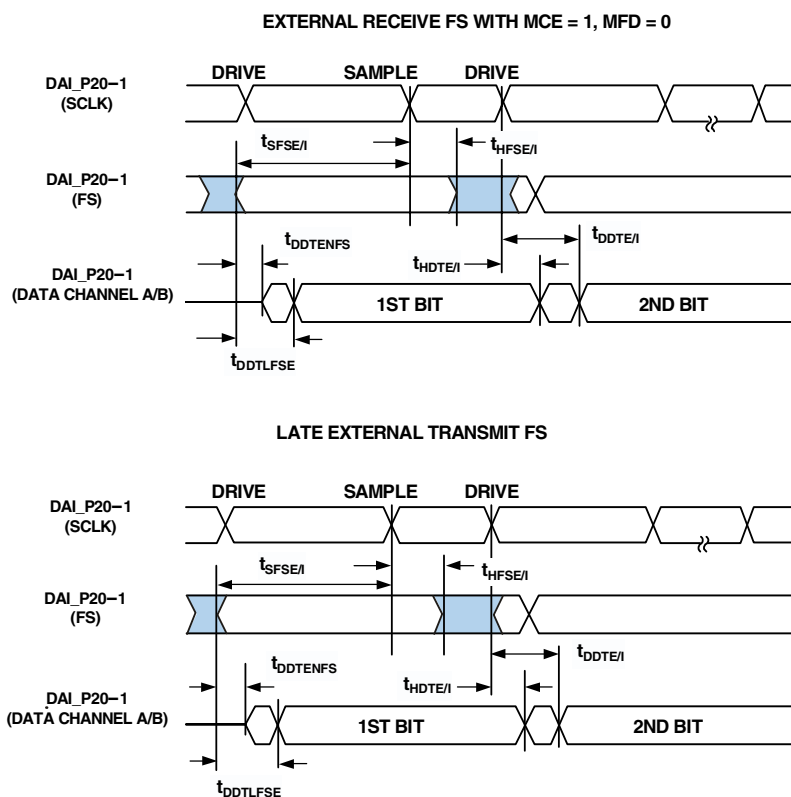

Figure 18. Serial Ports

NOTE: SERIAL PORT SIGNALS (SCLK, FS, DATA CHANNEL A/B) ARE ROUTED TO THE DAI_P20-1 PINS USING THE SRU. THE TIMING SPECIFICATIONS PROVIDED HERE ARE VALID AT THE DAI_P20-1 PINS.

Figure 17. External Late Frame Sync¹

¹This figure reflects changes made to support left-justified sample pair mode.

Input Data Port

The timing requirements for the IDP are given in [Table 29](#). IDP signals (SCLK, FS, and SDATA) are routed to the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20-1 pins.

Table 29. IDP

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{SIFS}^1	FS Setup Before SCLK Rising Edge	2.5		ns
t_{SIHFS}^1	FS Hold After SCLK Rising Edge	2.5		ns
t_{SISD}^1	SDATA Setup Before SCLK Rising Edge	2.5		ns
t_{SIHD}^1	SDATA Hold After SCLK Rising Edge	2.5		ns
$t_{IDPCLKW}$	Clock Width	11.25		ns
t_{IDPCLK}	Clock Period	30		ns

¹ DATA, SCLK, FS can come from any of the DAI pins. SCLK and FS can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

Figure 19. IDP Master Timing

Parallel Data Acquisition Port (PDAP)

The timing requirements for the PDAP are provided in [Table 30](#). PDAP is the parallel mode operation of channel 0 of the IDP. Note that the most significant 16 bits of external PDAP

data can be provided through the DATA31–16 pins. The remaining 4 bits can only be sourced through DAI_P4–1. The timing below is valid at the DATA16–1 pins.

Table 30. Parallel Data Acquisition Port (PDAP)

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
$t_{SPCLKEN}^1$	PDAP_CLKEN Setup Before PDAP_CLK Sample Edge	2.5		ns
$t_{HPCLKEN}^1$	PDAP_CLKEN Hold After PDAP_CLK Sample Edge	2.5		ns
t_{PDSD}^1	PDAP_DAT Setup Before SCLK PDAP_CLK Sample Edge	2.5		ns
t_{PDHD}^1	PDAP_DAT Hold After SCLK PDAP_CLK Sample Edge	2.5		ns
t_{PDCLKW}	Clock Width	8.75		ns
t_{PDCLK}	Clock Period	30		ns
<i>Switching Characteristics</i>				
t_{PDHLDD}	Delay of PDAP Strobe After Last PDAP_CLK Capture Edge for a Word	$2 \times t_{PCLK} - 1$		ns
t_{PDSTRB}	PDAP Strobe Pulse Width	$2 \times t_{PCLK} - 1$		ns

¹ Source pins of DATA are ADDR7–0, DATA7–0, or DAI pins. Source pins for SCLK and FS are: 1) DAI pins, 2) CLKIN through PCG, or 3) DAI pins through PCG.

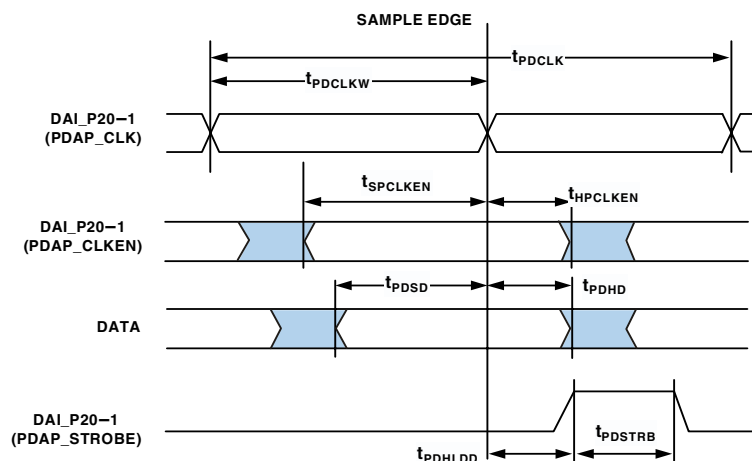

Figure 20. PDAP Timing

Pulse Width Modulation Generators

Table 31. PWM Timing

Parameter		Min	Max	Unit
<i>Switching Characteristics</i>				
t_{PWMW}	PWM Output Pulse Width	$t_{PCLK} - 2$	$(2^{16} - 2) \times t_{PCLK} - 2$	ns
t_{PWMP}	PWM Output Period	$2 \times t_{PCLK} - 1.5$	$(2^{16} - 1) \times t_{PCLK} - 1.5$	ns

Figure 21. PWM Timing

SPDIF Transmitter

Serial data input to the SPDIF transmitter can be formatted as left justified, I²S or right-justified with word widths of 16, 18, 20, or 24 bits. The following sections provide timing for the transmitter.

SPDIF Transmitter—Serial Input Waveforms

Figure 22 shows the right-justified mode. LRCLK is HI for the left channel and LO for the right channel. Data is valid on the rising edge of SCLK. The MSB is delayed 12-bit clock periods (in 20-bit output mode) or 16-bit clock periods (in 16-bit output

mode) from an LRCLK transition, so that when there are 64 SCLK periods per LRCLK period, the LSB of the data will be right-justified to the next LRCLK transition.

Figure 22. Right-Justified Mode

Figure 23 shows the default I²S-justified mode. LRCLK is LO for the left channel and HI for the right channel. Data is valid on the rising edge of SCLK. The MSB is left-justified to an LRCLK transition but with a single SCLK period delay.

Figure 23. I²S-Justified Mode

Figure 24 shows the left-justified mode. LRCLK is HI for the left channel and LO for the right channel. Data is valid on the rising edge of SCLK. The MSB is left-justified to an LRCLK transition with no MSB delay.

Figure 24. Left-Justified Mode

SPDIF Transmitter Input Data Timing

The timing requirements for the input data port are given in Table 32. Input signals (SCLK, FS, SDATA) are routed to the DAI_P20-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20-1 pins.

Table 32. SPDIF Transmitter Input Data Timing

Parameter	Min	Max	Unit
<i>Timing Requirements</i>			
t_{SISFS}^1 FS Setup Before SCLK Rising Edge	3		ns
t_{SIHFS}^1 FS Hold After SCLK Rising Edge	3		ns
t_{SISD}^1 SData Setup Before SCLK Rising Edge	3		ns
t_{SIHD}^1 SData Hold After SCLK Rising Edge	3		ns
$t_{SITXCLKW}$ Transmit Clock Width	11.25		ns
$t_{SITXCLK}$ Transmit Clock Period	30		ns

¹ DATA, SCLK, FS can come from any of the DAI pins. SCLK and FS can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

Figure 25. SPDIF Transmitter Input Timing

Oversampling Clock (TxCLK) Switching Characteristics

The SPDIF transmitter has an oversampling clock. This TxCLK input is divided down to generate the biphas clock.

Table 33. Over Sampling Clock (TxCLK) Switching Characteristics

Parameter	Min	Max	Unit
TxCLK Frequency for TxCLK = $768 \times FS$		147.5	MHz
TxCLK Frequency for TxCLK = $512 \times FS$		98.4	MHz
TxCLK Frequency for TxCLK = $384 \times FS$		73.8	MHz
TxCLK Frequency for TxCLK = $256 \times FS$		49.2	MHz
Frame Rate		192.0	kHz

SPDIF Receiver

The following section describes timing as it relates to the SPDIF receiver.

Internal Digital PLL Mode

In the internal digital phase-locked loop mode the internal PLL (digital PLL) generates the $512 \times FS$ clock.

Table 34. SPDIF Receiver Internal Digital PLL Mode Timing

Parameter		Min	Max	Unit
<i>Switching Characteristics</i>				
t_{DFSI}	LRCLK Delay After SCLK		5	ns
t_{HOFSI}	LRCLK Hold After SCLK	-2		ns
t_{DDTI}	Transmit Data Delay After SCLK		5	ns
t_{HDTI}	Transmit Data Hold After SCLK	-2		ns
t_{SCLKIW}^1	Transmit SCLK Width	60		ns

¹ SCLK frequency is $64 \times FS$ where FS = the frequency of LRCLK.

Figure 26. SPDIF Receiver Internal Digital PLL Mode Timing

SPI Interface—Master

The ADSP-21371 contains two SPI ports. The primary has dedicated pins and the secondary is available through the DPI. The timing provided in [Table 35](#) and [Table 36](#) applies to both.

Table 35. SPI Interface Protocol — Master Switching and Timing Specifications

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{SSPIDM}	Data Input Valid To SPICLK Edge (Data Input Set-up Time)	8		ns
t_{HSPIDM}	SPICLK Last Sampling Edge To Data Input Not Valid	2		ns
<i>Switching Characteristics</i>				
$t_{SPICLKM}$	Serial Clock Cycle	$8 \times t_{PCLK}$		ns
t_{SPICHM}	Serial Clock High Period	$4 \times t_{PCLK}$		ns
t_{SPICLM}	Serial Clock Low Period	$4 \times t_{PCLK} - 2$		ns
$t_{DDSPIDM}$	SPICLK Edge to Data Out Valid (Data Out Delay Time)		0	
$t_{HDSPIDM}$	SPICLK Edge to Data Out Not Valid (Data Out Hold Time)	2		ns
t_{SDSCIM}	FLAG3–0IN (SPI device select) Low to First SPICLK Edge	$4 \times t_{PCLK} - 2$		ns
t_{HDSM}	Last SPICLK Edge to FLAG3–0IN High	$4 \times t_{PCLK} - 1$		ns
t_{SPITDM}	Sequential Transfer Delay	$4 \times t_{PCLK} - 1$		ns

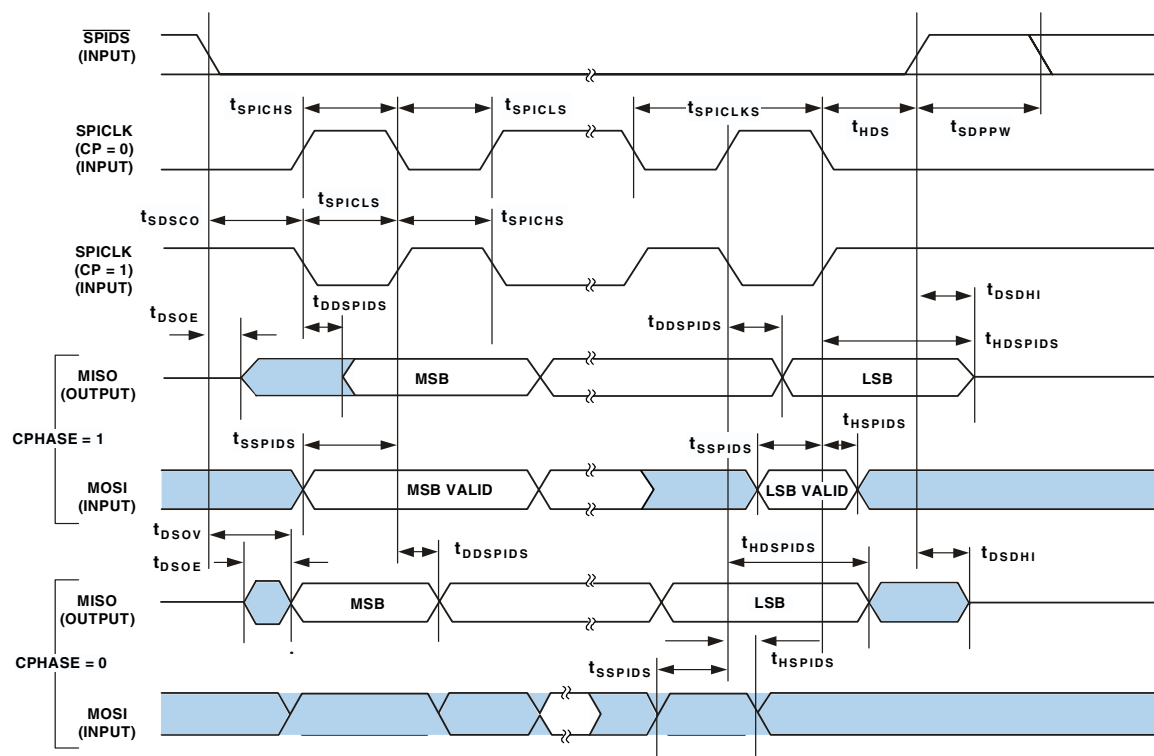

Figure 28. SPI Slave Timing

Universal Asynchronous Receiver-Transmitter
(UART) Port—Receive and Transmit Timing

Figure 29 describes UART port receive and transmit operations. The maximum baud rate is SCLK/16. As shown in Figure 29 there is some latency between the generation of internal UART interrupts and the external data operations. These latencies are negligible at the data transmission rates for the UART.

Table 37. UART Port

Parameter	Min	Max	Unit
Timing Requirement			
t _{RXD} Incoming Data Pulse Width	≥95		ns

Figure 29. UART Port—Receive and Transmit Timing

TWI Controller Timing

Table 38 and Figure 30 provide timing information for the TWI interface. Input Signals (SCL, SDA) are routed to the DPI_P14-1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DPI_P14-1 pins.

Table 38. Characteristics of the SDA and SCL Bus Lines for F/S-Mode TWI Bus Devices¹

Parameter		Standard-mode		Fast-mode		Unit
		Min	Max	Min	Max	
f_{SCL}	SCL Clock Frequency	0	100	0	400	kHz
t_{HDSTA}	Hold Time (repeated) START Condition. After this Period, the First Clock Pulse is Generated.	4.0		0.6		μ s
t_{LOW}	LOW Period of the SCL Clock	4.7		1.3		μ s
t_{HIGH}	HIGH period of the SCL Clock	4.0		0.6		μ s
t_{SUSTA}	Set-up time for a repeated START condition	4.7		0.6		μ s
t_{HDDAT}	Data Hold Time for TWI-bus Devices	0		0		μ s
t_{SUDAT}	Data Set-up Time	250		100		ns
t_{SUSTO}	Set-up Time for STOP Condition	4.0		0.6		μ s
t_{BUF}	Bus Free Time Between a STOP and START Condition	4.7		1.3		μ s
t_{SP}	Pulse Width of Spikes Suppressed By the Input Filter	n/a	n/a	0	50	ns

¹ All values referred to V_{IHmin} and V_{ILmax} levels. For more information, see Electrical Characteristics on page 15.

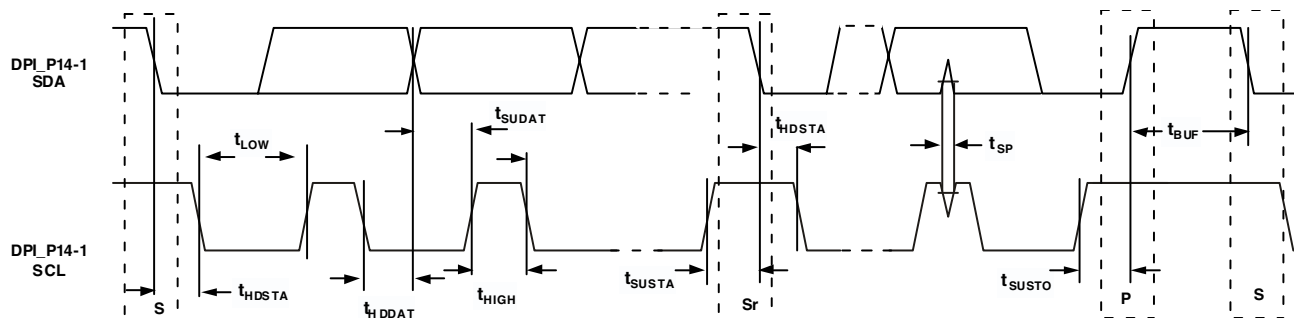

Figure 30. Fast and Standard Mode Timing on the TWI Bus

JTAG Test Access Port and Emulation**Table 39. JTAG Test Access Port and Emulation**

Parameter		Min	Max	Unit
<i>Timing Requirements</i>				
t_{TCK}	TCK Period	t_{CK}		ns
t_{STAP}	TDI, TMS Setup Before TCK High	5		ns
t_{HTAP}	TDI, TMS Hold After TCK High	6		ns
t_{SSYS}^1	System Inputs Setup Before TCK High	7		ns
t_{HSYS}^1	System Inputs Hold After TCK High	18		ns
t_{TRSTW}	\overline{TRST} Pulse Width	$4t_{CK}$		ns
<i>Switching Characteristics</i>				
t_{DTDO}	TDO Delay from TCK Low		7	ns
t_{DSYS}^2	System Outputs Delay After TCK Low		$t_{CK} \div 2 + 7$	ns

¹System Inputs = AD15-0, \overline{SPIDS} , CLKCFG1-0, \overline{RESET} , BOOTCFG1-0, MISO, MOSI, SPICLK, DAI_Px, and FLAG3-0.

²System Outputs = MISO, MOSI, SPICLK, DAI_Px, AD15-0, \overline{RD} , \overline{WR} , FLAG3-0, CLKOUT, \overline{EMU} , and ALE.

Figure 31. IEEE 1149.1 JTAG Test Access Port

OUTPUT DRIVE CURRENTS

Figure 32 shows typical I-V characteristics for the output drivers of the ADSP-21371. The curves represent the current drive capability of the output drivers as a function of output voltage.

TBD

Figure 32. ADSP-21371 Typical Drive

TEST CONDITIONS

The ac signal specifications (timing parameters) appear Table 15 on page 20 through Table 39 on page 42. These include output disable time, output enable time, and capacitive loading. The timing specifications for the SHARC apply for the voltage reference levels in Figure 33.

Timing is measured on signals when they cross the 1.5 V level as described in Figure 34. All delays (in nanoseconds) are measured between the point that the first signal reaches 1.5 V and the point that the second signal reaches 1.5 V.

Figure 33. Equivalent Device Loading for AC Measurements
(Includes All Fixtures)

Figure 34. Voltage Reference Levels for AC Measurements

CAPACITIVE LOADING

Output delays and holds are based on standard capacitive loads: 30 pF on all pins (see Figure 33). Figure 37 shows graphically how output delays and holds vary with load capacitance. The graphs of Figure 35, Figure 36, and Figure 37 may not be linear outside the ranges shown for Typical Output Delay vs. Load Capacitance and Typical Output Rise Time (20%-80%, V=Min) vs. Load Capacitance.

TBD

Figure 35. Typical Output Rise/Fall Time (20%-80%,
 $V_{DDEXT} = \text{Max}$)

TBD

Figure 36. Typical Output Rise/Fall Time (20%-80%,
 $V_{DDEXT} = \text{Min}$)

TBD

Figure 37. Typical Output Delay or Hold vs. Load Capacitance
(at Ambient Temperature)

THERMAL CHARACTERISTICS

The ADSP-21371 processor is rated for performance over the temperature range specified in [Operating Conditions on Page 15](#).

[Table 40](#) airflow measurements comply with JEDEC standards JESD51-2 and JESD51-6 and the junction-to-board measurement complies with JESD51-8. Test board design complies with JEDEC standards JESD51-7 (MQFP). The junction-to-case measurement complies with MIL-STD-883. All measurements use a 2S2P JEDEC test board.

To determine the junction temperature of the device while on the application PCB, use:

$$T_J = T_{CASE} + (\Psi_{JT} \times P_D)$$

where:

T_J = Junction temperature °C

T_{CASE} = Case temperature (°C) measured at the top center of the package

Ψ_{JT} = Junction-to-top (of package) characterization parameter is the Typical value from [Table 40](#).

P_D = Power dissipation (see EE Note #TBD)

Values of θ_{JA} are provided for package comparison and PCB design considerations. θ_{JA} can be used for a first order approximation of T_J by the equation:

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where:

T_A = ambient temperature °C

Values of θ_{JC} are provided for package comparison and PCB design considerations when an external heatsink is required.

Values of θ_{JB} are provided for package comparison and PCB design considerations. Note that the thermal characteristics values provided in [Table 40](#) are modeled values.

Table 40. Thermal Characteristics for 208-Lead MQFP

Parameter	Condition	Typical	Unit
θ_{JA}	Airflow = 0 m/s	TBD	°C/W
θ_{JMA}	Airflow = 1 m/s	TBD	°C/W
θ_{JMA}	Airflow = 2 m/s	TBD	°C/W
θ_{JC}		TBD	°C/W
Ψ_{JT}	Airflow = 0 m/s	TBD	°C/W
Ψ_{JMT}	Airflow = 1 m/s	TBD	°C/W
Ψ_{JMT}	Airflow = 2 m/s	TBD	°C/W

PACKAGE DIMENSIONS

The ADSP-21371 is available in a 208-lead Pb-free MQFP package.

- NOTES:
1. THE ACTUAL POSITION OF EACH LEAD IS WITHIN 0.08 FROM ITS IDEAL POSITION WHEN MEASURED IN THE LATERAL DIRECTION.
 2. CENTER DIMENSIONS ARE TYPICAL UNLESS OTHERWISE NOTED.
 3. DIMENSIONS ARE IN MILLIMETERS AND COMPLY WITH JEDEC STANDARD MS-029, FA-1.
