

FEATURES

- Fixed gain of 15 dB
- Operation up to 500 MHz
- +39.1 dBm OIP3 at 70 MHz
- Noise Figure 3.0 dB at 70 MHz
- Input/output internally matched to 50 Ω
- Temperature and power supply stable
- Power supply: 5 V
- Power supply current: 95 mA
- 1000 V ESD (Class 1C)

GENERAL DESCRIPTION

The ADL5532 is a broadband, fixed-gain, linear amplifier that operate at frequencies up to 500 MHz. The device can be used in a wide variety of wired and wireless devices including cellular, GSM and WCDMA, and broadband applications.

Gain is stable over frequency, temperature, power supply and from device to device. The ADL5532 achieves an OIP3 of 39.1 dBm with an output compression point of +19.9 dBm and a noise figure of 3.0 dB.

This amplifier is single-ended and internally matched to 50 Ω with an input return loss of 10 dB. Only input/output ac-

coupling capacitors, a power supply decoupling capacitor and external inductor are required for operation.

The amplifier operates with a 5 V supply consuming 95 mA of current.

The ADL5532 is fabricated on a GaAs HBT process and has an ESD rating of 1000 V (Class 1C). The device is packaged in a 3mm x 3mm LFCSP that uses an exposed paddle for excellent thermal impedance and operates from -40°C to $+85^{\circ}\text{C}$. A fully populated evaluation board is available.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Figure 2. Pin Configuration

Table 3. Pin Function Descriptions Single

Pin No.	Mnemonic	Description
1,8	FBK1, FBK2	For operation below 50 MHz a 100nF capacitor should be connected between these pins.
2	RFIN	RF Input: Requires a DC blocking capacitor. For normal operating conditions a 10 nF capacitor is recommended
7	RFOUT	RF Output and Bias: DC bias provided to this pin through an inductor. For normal operating conditions a 470 nH inductor is recommended. RF path requires a DC blocking capacitor. For normal operating conditions a 10 nF capacitor is recommended.
3, 4, 6	NC	No Connect
5	CLIN Exposed Paddle	A 100 nF capacitor connected between pin 5 and ground provides decoupling for the on board linearizer. Internally connected to GND. Solder to a low impedance ground plane

EVALUATION BOARD

Figure 6 shows the schematic for the ADL5532 evaluation board. The board is powered by a single 5V supply.

The components used on the board are listed in. Table 4 Power can be applied to the board through clip-on leads (Vcc, Gnd), or through Jumper W1.
