GENERAL DESCRIPTION

The ADG779 is a monolithic CMOS SPDT (single-pole, double-throw) switch. This switch is designed on a submicron process that provides low power dissipation yet gives high switching speed, low on resistance, and low leakage currents.

The ADG779 operates from a single supply range of 1.8 V to 5.5 V, making it ideal for use in battery-powered instruments and with the new generation of DACs and ADCs from Analog Devices, Inc.

Each switch of the ADG779 conducts equally well in both directions when on. The ADG779 exhibits break-before-make switching action.

Because of the advanced submicron process, -3 dB bandwidth of greater than 200 MHz can be achieved.

The ADG779 is available in a 6-lead SC70 package.

PRODUCT HIGHLIGHTS

- 1. Tiny 6-Lead SC70 Package.
- 2. 1.8 V to 5.5 V Single-Supply Operation. The ADG779 offers high performance, including low on resistance and fast switching times, and is fully specified and guaranteed with 3 V and 5 V supply rails.
- 3. Very Low R_{ON} (5 Ω max at 5 V, 10 Ω max at 3 V). At 1.8 V operation, R_{ON} is typically 40 Ω over the temperature range.
- 4. On-Resistance Flatness ($R_{FLAT (ON)}$) (0.75 Ω typ).
- 5. -3 dB Bandwidth > 200 MHz.
- 6. Low Power Dissipation. CMOS construction ensures low power dissipation.
- 7. 14 ns Switching Times.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
