This device consists of bus transceiver circuits with 3 state, D-type flip-flops, and control circuitry arranged for multiplexed transmission of data directly from the input bus or from the internal storage registers. Enable (GAB) and (GBA) pins are provided to control the transceiver functions. Select AB and Select BA control pins are provided to select whether real-time or stored data is transferred. A low input level selects real-time, and a high selects stored data.

Data on the A or B bus, or both, can be stored in the internal D flip-flop by low to high transitions at the appropriate clock pins (CAB or CBA) regardless of the select or enable control pins. When select AB and select BA are in the real-time transfer mode, it is also possible to store data

### DESCRIPTION

The 74LCX652 is a low voltage CMOS OCTAL BUS TRANSCEIVER AND REGISTER (3-STATE) fabricated with sub-micron silicon gate and double-layer metal wiring C<sup>2</sup>MOS technology. It is ideal for low power and high speed 3.3V applications; it can be interfaced to 5V signal environment for both inputs and outputs.

without using the internal D-type flip-flops by simultaneously enabling GAB or  $\overline{\text{GBA}}$ . In this configuration each output reinforces its input. It has same speed performance at 3.3V than 5V AC/ACT family, combined with a lower power consumption.

All inputs and outputs are equipped with protection circuits against static discharge, giving them 2KV ESD immunity and transient excess voltage.
