

# HCF40105B

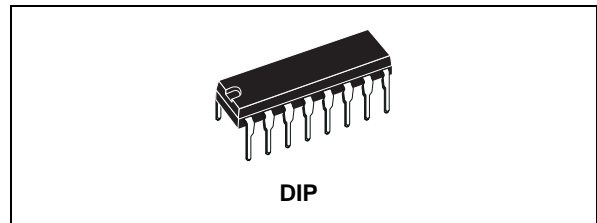

## FIFO REGISTER

- INDEPENDENT ASYNCHRONOUS INPUTS AND OUTPUTS
- 3-STATE OUTPUTS
- EXPANDABLE IN EITHER DIRECTION
- STATUS INDICATORS ON INPUT AND OUTPUT
- RESET CAPABILITY
- STANDARDIZED, SYMMETRICAL OUTPUT CHARACTERISTICS
- QUIESCENT CURRENT SPECIF. UP TO 20V
- 5V, 10V AND 15V PARAMETRIC RATINGS
- INPUT LEAKAGE CURRENT  
 $I_l = 100\text{nA (MAX) AT } V_{DD} = 18\text{V } T_A = 25^\circ\text{C}$
- 100% TESTED FOR QUIESCENT CURRENT
- MEETS ALL REQUIREMENTS OF JEDEC JESD13B "STANDARD SPECIFICATIONS FOR DESCRIPTION OF B SERIES CMOS DEVICES"

### DESCRIPTION

HCF40105B is a monolithic integrated circuit fabricated in Metal Oxide Semiconductor technology available in DIP packages.

HCF40105B is a low power first-in-first-out (FIFO) "elastic" storage register that can store 164-bit words. It is capable of handling input and output data at different shifting rates. This feature makes it particularly useful as a buffer between asynchronous systems. Each word position in the register is clocked by a control flip-flop, which stores a marker bit. "1" signifies that the position's data is filled and "0" denotes a vacancy in that

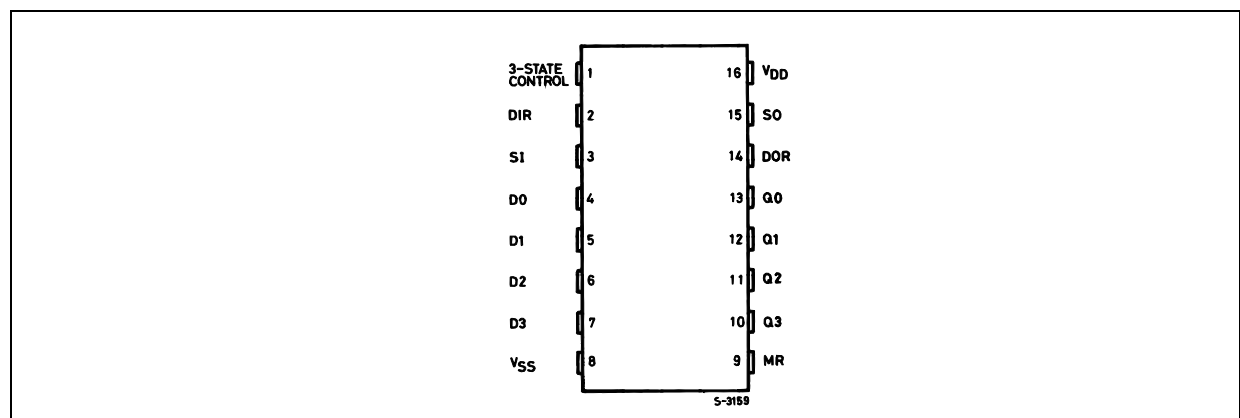

### ORDER CODES

position. The control flip-flop detects the state of the preceding flip-flop and communicates its own status to the succeeding flip-flop. When a control flip flop is in the "0" state and sees a "1" in the preceding flip-flop, it generates a clock pulse that transfers data from the preceding four data latches into its own four data latches and resets the preceding flip-flop to "0". The first and last control flip-flops have buffered outputs. Since all empty locations "bubble" automatically to the input end, and all valid data ripples through to the output end, the status of the first control flip-flop (DATA-IN READY) indicates if the FIFO is full, and the status of the last flip-flop (DATA-OUT READY) indicates if the FIFO contains data. As the earliest data is removed from the bottom of the data stack (the output end), all data entered later will automatically propagate (ripple) toward the output.

### PIN CONNECTION

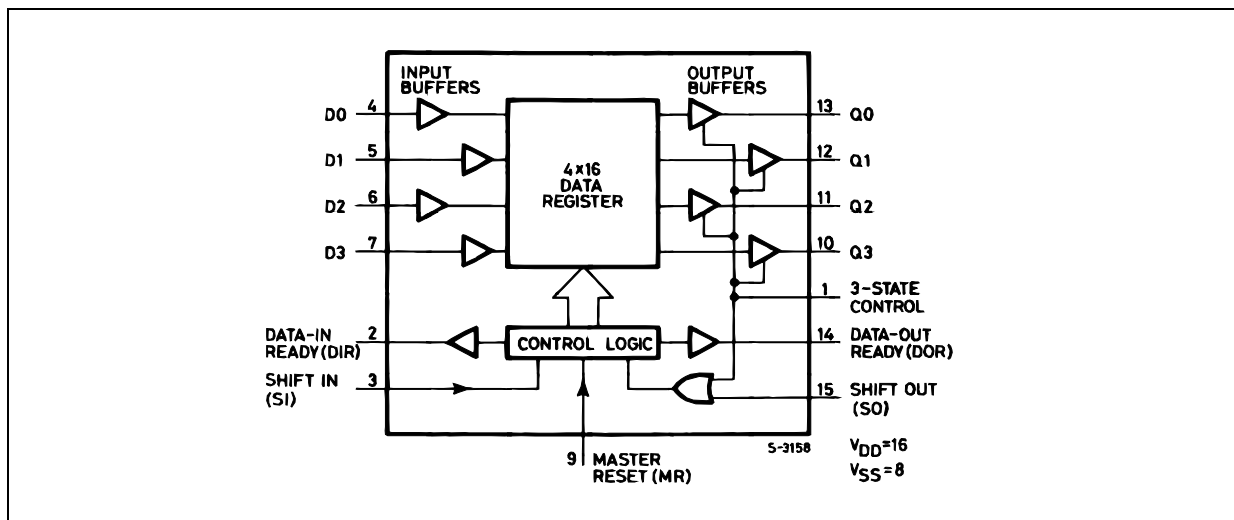

## INPUT EQUIVALENT CIRCUIT

## PIN DESCRIPTION

PIN No	SYMBOL	NAME AND FUNCTION
1	3-STATE CONTROL	3-State Control
2	DIR	Data-In Ready
3	SI	Shift In
15	SO	Shift Out
14	DOR	Data-Out Ready
4, 5, 6, 7	D0 to D3	Input Buffers
13, 12, 11, 10	Q0 to Q3	Output Buffers
9	MR	Master Reset
8	VSS	Negative Supply Voltage
16	VDD	Positive Supply Voltage

## FUNCTIONAL DIAGRAM

## TRUTH TABLE

CONTROL INPUTS				PRESET MODE	ACTION
CLR	APE	SPE	CI/CE		
H	H	H	H	Synchronous	Inhibit Counter
H	H	H	L		Count Down
H	H	L	X		Preset on Next Positive Clock Transition
H	L	X	X	Asynchronous	Preset Asynchronously
L	X	X	X		Clear to Maximum Count

X : Don't Care

Clock connected to Clock input

Synchronous Operation : changes occur on negative to positive clock transitions.

**ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	-0.5 to +22	V
$V_I$	DC Input Voltage	-0.5 to $V_{DD} + 0.5$	V
$I_I$	DC Input Current	$\pm 10$	mA
$P_D$	Power Dissipation per Package	200	mW
	Power Dissipation per Output Transistor	100	mW
$T_{op}$	Operating Temperature	-55 to +125	°C
$T_{stg}$	Storage Temperature	-65 to +150	°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied.

All voltage values are referred to  $V_{SS}$  pin voltage.

**RECOMMENDED OPERATING CONDITIONS**

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	3 to 20	V
$V_I$	Input Voltage	0 to $V_{DD}$	V
$T_{op}$	Operating Temperature	-55 to 125	°C

(\*) Typical temperature coefficient for all  $V_{DD}$  value is 0.3 %/°C.

**TYPICAL APPLICATION: EXPANSION, 8 BITS-WIDE-BY-16 N-BITS LONG.****APPLICATION INFORMATION****LOADING DATA**

Data can be entered whenever the DATA-IN READY (DIR) flag is high by a low to high transition on the SHIFT-IN (SI) input. This input must go low momentarily before the next word is accepted by the FIFO. The DIR flag will go low momentarily until the data has been transferred to the second location. The flag will remain low when all 16-word locations are filled with valid data, and further pulses on the SI input will be ignored until DIR goes high.

**UNLOADING DATA**

As soon as the first word has rippled to the output, DATA-OUT READY (DOR) goes high, and data can be removed by a falling edge on the SO input. This falling edge causes the DOR signal to go low while the word on the output is dumped and the next word moves to the output. As long as valid data is available in the FIFO, the DOR signal will go high again signifying that the next word is ready at the output. When the FIFO is empty, DOR will remain low, and any further commands will be ignored until a "1" marker ripples down to the last control register, when DOR goes high. Unloading of data is inhibited while the 3-state control input is high. The 3-state control signal should not be shifted from high to low (data outputs turned on)

while the SHIFT-OUT is at logic "0". This level change causes the first word to be shifted out (unloaded) immediately and the data to be lost.

**CASCADING**

HCF40105B can be cascaded to form longer registers simply by connecting the DIR to SO and DOR to SI. In the cascaded mode, a MASTER RESET pulse must be applied after the supply voltage is turned on. For words wider than 4-bits, the DIR and the DOR outputs must be gated together with AND gates. Their outputs drive the SI and SO inputs in parallel, if expanding is done in both directions.

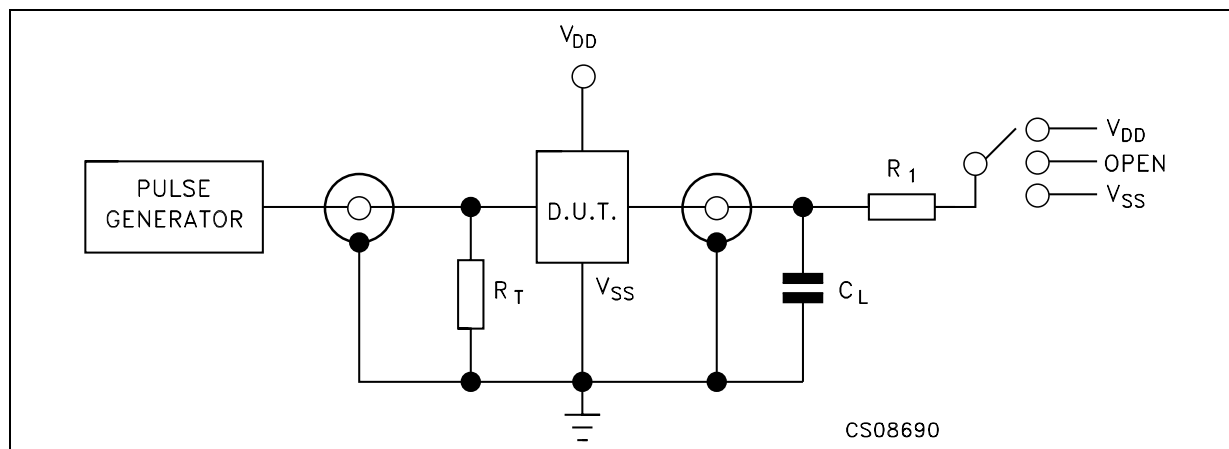

**3-STATE OUTPUTS**

In order to facilitate data busing, 3-state outputs are provided on the data output lines, while the load condition of the register can be detected by the state of the DOR output.

**MASTER RESET**

A high on the MASTER RESET (MR) sets all the control logic marker bits to "0". DOR goes low and DIR goes high. The contents of the data register do not change, only declared invalid, and will be superseded when the first word is loaded.

## TEST CIRCUIT

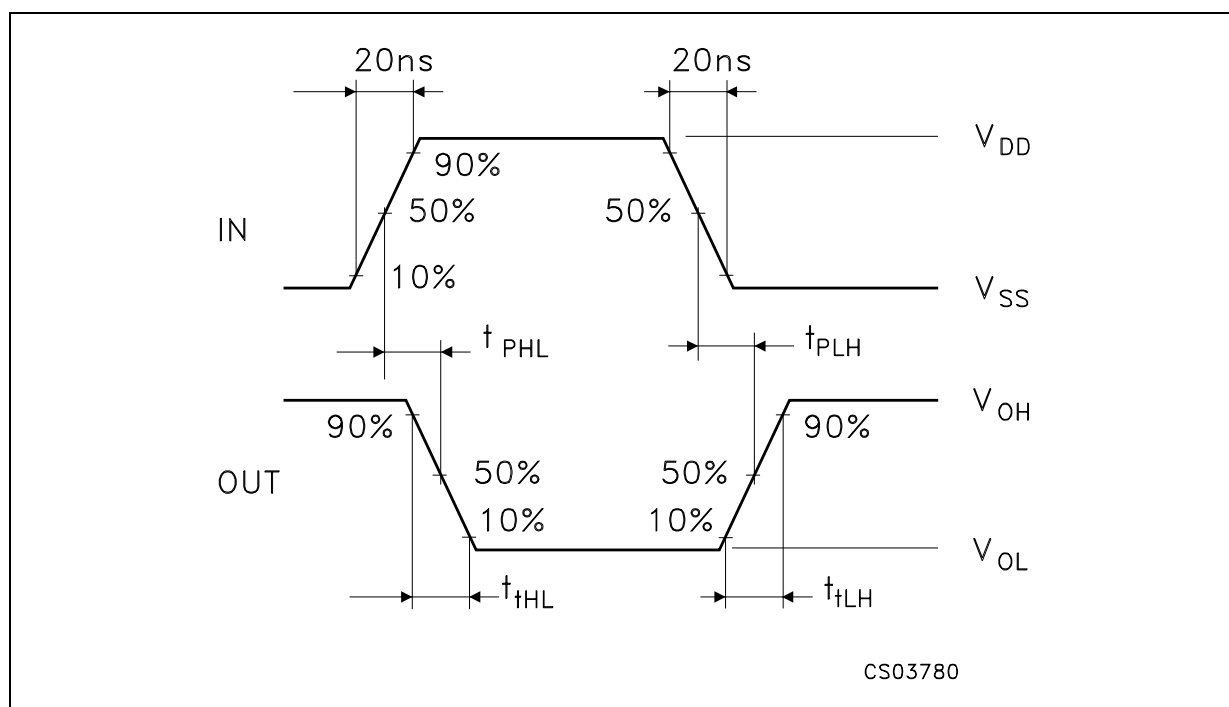

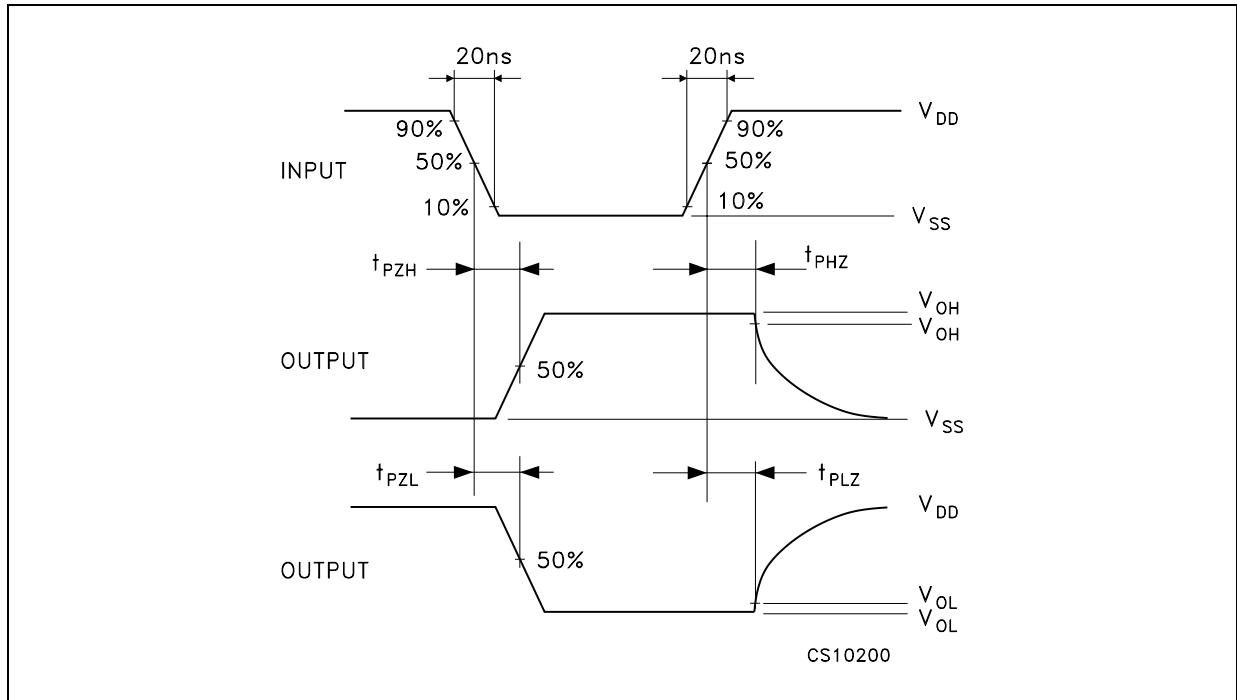

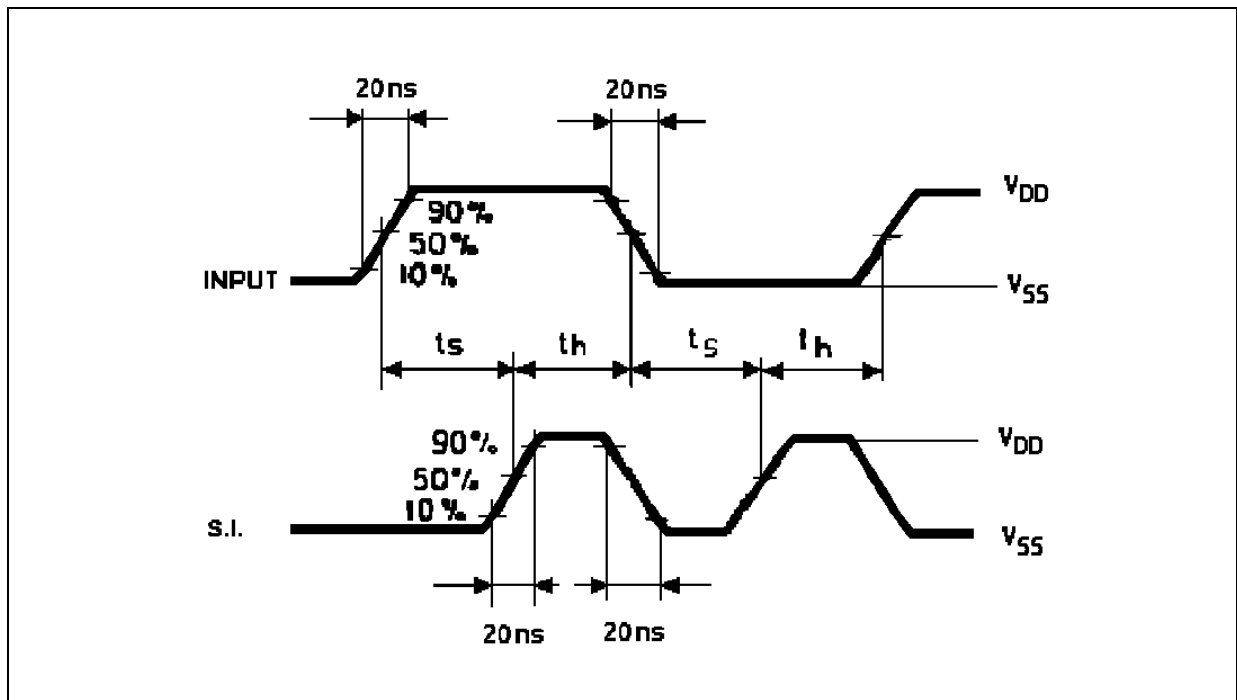

TEST	SWITCH
