GENERAL DESCRIPTION *Continued*

enabled PMI to make the OP-64 superior in cost and performance to many dielectrically-isolated and hybrid op amps.

Slew rate of the OP-64 is over 130V/ μ s. It is stable in gains of ≥ 5 and has a settling time of only 100ns to 0.1% with a 10V step input. However, unlike other high-speed op amps which have high supply requirements, the OP-64 needs less than 8mA of supply current. This enables the OP-64 to be packaged in space saving 8-pin packages. The OP-64 can deliver ± 80 mA of output current eliminating the need for a separate buffer amplifier in many applications. Noise of the OP-64 is only 8nV/ $\sqrt{\text{Hz}}$, reducing system noise in wideband applications. In addition to its dynamic performance, the OP-64 adds DC precision with an input offset voltage of under 1mV.

The OP-64 is an ideal choice for RF, video and pulse amplifier applications and in new designs can replace the HA-5190/95 or EL-2190/95 with improved performance and reduced power consumption. Its high output current also suits the OP-64 for use in A/D or cable driver applications. The OP-64 includes a **DISABLE** pin which, when set low, shuts the amplifier off and reduces the supply current to 0.75mA.

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage	± 18 V
Input Voltage	Supply Voltage

APPLICATIONS INFORMATION

POWER SUPPLY BYPASSING AND LAYOUT CONSIDERATIONS

Proper power supply bypassing is critical in all high-frequency circuit applications. For stable operation of the OP-64, the power supplies must maintain a low impedance-to-ground over an extremely wide bandwidth. This is most critical when driving a low resistance or large capacitance, since the current required to drive the load comes from the power supplies. A $10\mu F$ and $0.1\mu F$ ceramic bypass capacitor are recommended for each supply, as shown in Figure 1, and will provide adequate high-frequency bypassing in most applications. The bypass capacitors should be placed at the supply pins of the OP-64. As with all high frequency amplifiers, circuit layout is a critical factor in

obtaining optimum performance from the OP-64. Proper high frequency layout reduces unwanted signal coupling in the circuit. When breadboarding a high frequency circuit, use direct point-to-point wiring, keeping all lead lengths as short as possible. Do not use wire-wrap boards or "plug-in" prototyping boards.

During PC board layout, keep all lead lengths and traces as short as possible to minimize inductance. The feedback and gain-setting resistors should be as close as possible to the inverting input to reduce stray capacitance at that point. To further

FIGURE 1: Proper power supply bypassing is required to obtain optimum performance with the OP-64.

reduce stray capacitance, remove the ground plane from the area around the inputs of the OP-64. Elsewhere, the use of a solid unbroken ground plane will insure a good high-frequency ground.

FIGURE 2: *Input Offset Voltage Nulling***OFFSET VOLTAGE ADJUSTMENT**

Offset voltage is adjusted with a $20\text{k}\Omega$ potentiometer as shown in Figure 2. The potentiometer should be connected between pins 1 and 5 with its wiper connected to the $V-$ supply. The typical trim range is $\pm 4\text{mV}$.

OP-64 DISABLE AMPLIFIER SHUTDOWN

Pin 8 of the OP-64, **DISABLE**, is an amplifier shutdown control input. The OP-64 operates normally when Pin 8 is left floating. When greater than $250\mu\text{A}$ is drawn from the **DISABLE** pin, the OP-64 is disabled. The supply current drops to 1mA and the output impedance rises to $2\text{k}\Omega$. To draw current from the **DISABLE** pin, an open collector output logic gate or a discrete NPN transistor can be used as shown in Figure 3. An internal resistor

FIGURE 4: *DISABLE Turn-On/Turn-Off Test Circuit*

limits the **DISABLE** current to around $500\mu\text{A}$ if the **DISABLE** pin is grounded with the OP-64 powered by $\pm 15\text{V}$ supplies. These logic interface methods have the added advantage of level shifting the TTL signal to whatever supply voltage is used to power the OP-64.

Figure 4 shows a test circuit for measuring the turn-on and turn-off times for the OP-64. The OP-64 is in a gain of 5 with a $+1\text{V}$ DC input. As the input pulse to the 74LS04 rises its output falls,

FIGURE 3: *Simple circuits allow the OP-64 to be shut down.*

drawing current from the **DISABLE** pin and disabling the amplifier. The output voltage delay is shown in Figure 5 and takes 500 μ s to reach ground due to the extra current supplied to the amplifier by the 10 μ F electrolytic bypass capacitors. The turn-on time is much quicker than the turn-off time. In this situation as the input to the 74LS04 falls its output rises, returning the OP-64 to normal operation. The amplifier's output turns on in 250ns.

FIGURE 5: (a) OP-64 turn-on and turn-off performance. (b) Expanded scale showing turn-on performance of the OP-64.

OVERDRIVE RECOVERY

Figure 6 shows the overdrive recovery performance of the OP-64. Typical recovery time is 270ns from negative overdrive and 80ns from positive overdrive.

VIDEO AMPLIFIER/TERMINATED LINE DRIVER

The OP-64 can be used as a video amplifier/terminated line driver as shown in Figure 8. With its high output current capability, the OP-64 eliminates the need for an external buffer.

FIGURE 6: OP-64 Overdrive Recovery

The 75 Ω cable termination resistor minimizes reflections from the end of the cable. The 75 Ω series output resistor absorbs any reflections caused by a mismatch between the 75 Ω termination resistor and the characteristic cable impedance. In this circuit the output voltage, V_{OUT} , is one-half of the OP-64's output voltage due to the divider formed by the 75 Ω terminating resistors. The output voltage at the end of the terminated cable, V_{OUT} , spans -1V to +1V. The differential gain and phase for the video amplifier is summarized in Table 1.

TABLE 1: Differential Gain and Phase of Video Amplifier/Line Driver

V_S	Differential Gain		Differential Phase	
	3.58MHz	5MHz	3.58MHz	5MHz
$\pm 15V$	0.008dB	0.016dB	0.03°	0.03°
$\pm 12V$	0.008dB	0.018dB	0.03°	0.03°

FIGURE 7: Overdrive Recovery Test Circuit

FIGURE 8: Video Amplifier/Terminated Line Driver

OP-64

FIGURE 9: Fast Transimpedance Amplifier

FAST TRANSIMPEDANCE AMPLIFIER

The circuit shown in Figure 9 is a fast transimpedance amplifier designed to handle high speed signals from a high impedance source such as the output of a photomultiplier tube. The input current is amplified and converted to an output voltage by the transimpedance amplifier.

A JFET source-follower input is used to reduce the input bias current of the amplifier to 100 pA and lower the input current noise. Transimpedance of the amplifier is:

$$\frac{V_{OUT}}{I_{IN}} = \left(\frac{R_1}{R_2} + 1 \right) R_3$$

and for the values shown equals

$$\frac{V_{OUT}}{I_{IN}} = \left(\frac{800\Omega}{200\Omega} + 1 \right) 400k\Omega = 2V/\mu A$$

Figure 10 shows the output of the transimpedance amplifier when driven from a 1MΩ source impedance. The input signal of 10μA_{p-p} is converted into an output voltage of (10μA) 2V/μA = 20V_{p-p}. Output slew rate is 100V/μs. The slew rate is limited by the combination of the capacitance of the JFET gate with the 1MΩ source impedance. For best performance, the stray input capacitance should be kept as small as possible. The OP-97 is used in an integrator loop to reduce the total amplifier offset voltage to under 25μV.

FIGURE 10: Output of the Fast Transimpedance Amplifier

OP-64 SPICE MACRO-MODEL

Figure 11 shows the node and net list for a SPICE macro-model of the OP-64. The model is a simplified version of the actual device and simulates important DC parameters such as V_{OS} , I_{OS} , I_B , A_{VO} , CMR, V_O and I_{SY} . AC parameters such as slew rate, gain and phase response and CMR change with frequency are also simulated by the model.

The model uses typical parameters for the OP-64. The poles and zeros in the model were determined from the actual open and closed-loop gain and phase response of the OP-64. In this way the model presents an accurate AC representation of the actual device. The model assumes an ambient temperature of 25°C (see following pages).
