## 1 Introduction

Figure 1: GLK240128-25/GLT240128 Display

The GLK240128-25/GLT240128 is an intelligent graphic liquid crystal display engineered to quickly and easily add an elegant creativity to any application. In addition to the RS232, TTL and I2C protocols available in the standard model, USB and RS422 communication models allow the GLK240128-25/GLT240128 to be connected to a wide variety of host controllers. Communication speeds of up to 115.2kbps for serial protocols and 100kbps for I<sup>2</sup>C ensure lightning fast text and graphic display.

The simple command structure permits easy software control of many settings including backlight brightness, screen contrast, and baud rate. On board memory provides a whopping 256KB of customizable fonts and bitmaps to enhance the graphical user experience.

User input on the GLK240128-25 is available through a five by five matrix style keypad or a resistive touch overlay on the GLT240128. Six general purpose outputs provide simple switchable five volt sources on each model. In addition, a versatile Dallas One-Wire header provides a communication interface for up to thirty-two devices.

The versatile GLK240128-25/GLT240128, with all the features mentioned above, is available in a variety of colour, voltage, and temperature options to suit almost any application.

# 2 Quick Connect Guide

## 2.1 Available Headers

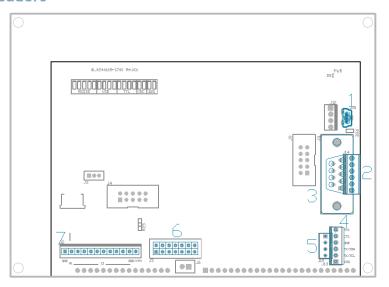

Figure 2: GLK240128-25/GLT240128 Header Locations

Table 1: List of Available Headers

#	Header	Mate	Population
1	Mini USB Connector	EXTMUSB3FT/INTMUSB3FT	USB Model Only
2	RS422 Terminal Block	16-30 AWG Wire	422 Model Only
3	DB9 Serial Header	CSS1FT/CSS4FT	Standard Model Only
4	Extended Communication/Power Connector	ESCCPC5V/BBC	Standard Model Only
5	Alternate Power Connector	PCS	422 and USB Models Only
6	GPO Header	None Offered	All Models
7	Keypad	KPP4x4	GLK Model Only

## 2.2 Standard Module

The standard version of the GLK240128-25/GLT240128 allows for user configuration of two common communication protocols. First, the unit can communicate using serial protocol at either RS323 or TTL voltage levels. Second, it can communicate using the Inter-Integrated Circuit connect, or I<sup>2</sup>C protocol. Connections for each protocol can be accessed through the four pin Communication/Power Header as outlined in the Serial Connections and I<sup>2</sup>C Connections sections below.

#### **Recommended Parts**

Figure 3: Extended Communication/Power
Cable (ESCCPC5V)

The most common cable choice for any standard Matrix Orbital display, the Extended Communication/ Power Cable offers a simple connection to the unit with familiar interfaces. DB9 and floppy power headers provide all necessary input to drive your display.

Figure 4: Breadboard Cable (BBC)

For a more flexible interface to the GLK240128-25/GLT240128, a Breadboard Cable may be used. This provides a simple four wire connection that is popular among developers for its ease of use in a breadboard environment.

## **Serial Connections**

Serial protocol provides a classic connection to the GLK240128-25/GLT240128. The Extended Communication/Power Cable is most commonly used for this set up as it provides connections for DB9 serial and floppy power cables. To place your board in Serial mode, adhere to the steps laid out below.

- 1. Set the Protocol Select jumpers.
  - RS232: Connect the five jumpers\* in the 232 protocol box with the zero ohm jumper resistors provided or an alternate wire or solder solution.
  - TTL: Connect the four jumpers\* in the TTL protocol box.

\*Note: Jumpers must be removed from all protocol boxes save for the one in use.

#### 2. Make the connections.

- a. Connect the six pin female header of the Communication/Power Cable to the Extended Communication/Power Header of your GLK240128-25/GLT240128.
- b. Insert the male end of your serial cable to the corresponding DB9 header of the Extended Communication/Power Cable and the mate the female connector with the desired communication port of your computer.
- c. Select an unmodified floppy cable from a PC power supply and connect it to the power header of the Communication/Power Cable.

#### 3. Create.

 MOGD# or a terminal program will serve to get you started, and then you can move on with your own development. Instructions for the former can be found below and a variety of application notes are available for the latter at www.matrixorbital.ca/appnotes.

## I<sup>2</sup>C Connections

A more advanced connection to the GLK240128-25/GLT240128 is provided by the I<sup>2</sup>C protocol setting. This is best accomplished using a breadboard and the Breadboard Cable. Power must be supplied from your breadboard or another external source. To dive right into your application and use the GLK240128-25/GLT240128 in I<sup>2</sup>C mode, get started with the guidelines below.

- 1. Set the Protocol Select switches.
  - I<sup>2</sup>C: Ensure that the two I<sup>2</sup>C jumpers in the corresponding protocol box are connected while all others are open.
- 2. Make the connections.
  - a. Connect the Breadboard Cable to the Extended Communication/Power Header on your GLK240128-25/GLT240128 and plug the four leads into your breadboard. The red lead will require power, while the black should be connected to ground, and the green and yellow should be connected to your controller clock and data lines respectively.
  - b. Pull up the clock and data lines to five volts using a resistance between one and ten kilohms on your breadboard.

#### 3. Create.

• This time you're on your own. While there are many examples within the Matrix Orbital AppNote section, <a href="www.matrixorbital.ca/appnotes">www.matrixorbital.ca/appnotes</a>, too many controllers and languages exist to cover them all. If you get stuck in development, it is possible to switch over to another protocol on the standard board, and fellow developers are always on our forums for additional support.

## 2.3 USB Module

The GLK240128-25-USB/GLT240128-USB offers a single USB protocol for easy connection to a host computer. The simple and widely available protocol can be accessed using the on board mini B style USB connector as outlined in the USB Connections section.

#### **Recommended Parts**

(EXTMUSB3FT)

The External Mini USB cable is recommended for the GLK240128-25-USB/GLT240128-USB display. It will connect to the miniB style header on the unit and provide a connection to a regular A style USB connector, commonly found on a PC.

## **USB Connections**

The USB connection is the quickest, easiest solution for PC development. After driver installation, the GLK240128-25-USB/GLT240128-USB will be accessible through a virtual serial port, providing the same result as a serial setup without the cable hassle. To connect to your GLK240128-25-USB/GLT240128-USB please follow the steps below.

- 1. Set the Protocol Select jumpers.
  - USB: The GLK240128-25-USB/GLT240128-USB offers USB protocol only. Model specific
    hardware prevents this unit from operating in any other protocol, and does not allow other
    models to operate in USB. Protocol Select jumpers on the USB model cannot be moved.
- 2. Make the connections.
  - Plug the mini-B header of your External Mini USB cable into your GLK240128-25-USB/GLT240128-USB and the regular USB header into your computer USB jack\*.
- 3. Install the drivers.
  - a. Download the latest drivers at <u>www.matrixorbital.ca/drivers</u>, and save them to a known location.
  - b. When prompted, install the USB bus controller driver automatically
  - c. If asked, continue anyway, even though the driver is not signed
  - d. When the driver install is complete, your display will turn on, but communication will not yet be possible.
  - e. At the second driver prompt, install the serial port driver automatically
  - f. Again, if asked, continue anyway
- 4. Create.
  - Use MOGD# or a terminal program to get started, and then move on with your own
    development. Instructions for the former can be found below and a number of application
    notes are available for the latter at <a href="https://www.matrixorbital.ca/appnotes">www.matrixorbital.ca/appnotes</a>.

<sup>\*</sup>Note: The YG version of the GLK240128-25-USB/GLT240128-USB will require the alternate power connection.

## 2.4 RS422 Module

The GLK240128-25-422/GLT240128-422 provides an industrial alternative to the standard RS232 communication protocol. Rather than single receive and transmit lines, the RS422 model uses a differential pair for receive and transmit signals to reduce degradation and increase transmission lengths. Power can be transmitted at distance to a -VPT module or supplied from the immediate vicinity to a regular or -V unit. RS422 signals are available in a six pin connector as described in the RS422 Connections section.

#### **RS422 Connections**

The GLK240128-25-422/GLT240128-422 provides a robust RS422 interface to the display line. For this interface, a series of six wires are usually screwed into the RS422 terminal block provided. An alternate header is also available to provide local power to a regular or -V unit. To connect to your GLK240128-25-422/GLT240128-422, adhere to the steps laid out below.

- 1. Set the Protocol Select jumpers.
  - RS422: The GLK240128-25-422/GLT240128-422 offers only RS422 protocol and does not require any jumper changes.
- 2. Make the connections.
  - a. Screw one wire; sized 16 to 30 on the American Wire Gauge, into each of the six terminal block positions. When local power is supplied, a floppy cable may link to the alternate power header.
  - b. Connect the Vcc wire to the positive terminal of your power supply and the GND terminal to the negative or ground lead to provide appropriate power as per Voltage Specifications.
  - c. Secure the A and B wires to your non-inverting and inverting output signals respectively, while attaching the Z and Y wires to your inverting and non-inverting inputs.

#### 3. Create

a. In a PC environment, MOGD# or a terminal program will serve to get you started. In addition, a variety of application notes are available online in a number of different languages to aid in the development of a host controller. Instructions for these programs can be found below and the simple C# example at <a href="https://www.matrixorbital.ca/appnotes">www.matrixorbital.ca/appnotes</a> is a great first programming reference.

## 3 Software

The multiple communication protocols available and simple command structure of the GLK240128-25/GLT240128 means that a variety of applications can be used to communicate with the display. Text is sent to the display as a character string, for example, sending the decimal value 41 will result in an 'A' appearing on the screen. A single control character is also available. Commands are merely values prefixed with a special command byte, 254 in decimal.

Table 2: Reserved Control Characters

Once the correct communication port is identified, the following communication settings can be applied to communicate correctly with the GLK240128-25/GLT240128.

Table 3: Communication Settings

BPS	Data Bits	Parity	Stop Bits	Flow Control
19200	8	None	1	None

Finally, with a communication port identified and correctly setup simple text strings or even command bytes can easily be transmitted to control your display.

#### 3.1 MOGD#

The Matrix Orbital Graphic Display interface, MOGD#, is offered as a free download from <a href="https://www.matrixorbital.ca/software/software\_graphic">www.matrixorbital.ca/software/software\_graphic</a>. It provides a simple graphical interface that allows settings, fonts, and bitmaps to be easily customised for any application.

While monochromatic bitmaps can easily be created in virtually any image editing program, MOGD# provides an extensive font generation suite to stylize your display to any project design. In addition to standard font wide modifications, character ranges can be specified by start and end values to eliminate unused symbols, and individual glyphs can be modified with a double click. Finally, text spacing can be tailored and a complete font library built with your Matrix Orbital graphic display.

Like uProject, MOGD# offers a scripting capability that provides the ability to stack, run, and save a series of commands. The most basic function is the Send Numeric tool which is used to transmit a string of values to the display to write text or execute a command.

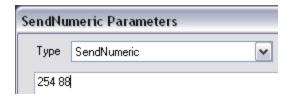

Figure 6: MOGD# Command Example

Again, the clear screen command is sent to a connected display, this time using the MOGD# Send Numeric function command style. Scripts can be run as a whole using the Play button from the toolbar or as single commands by selecting Step; once executed it must be Reset. Before issuing commands, it is a good idea to ensure communication with a display is successful using the autodetect button.

This program provides both a staging areas for your graphics display and a proving ground that will prepare it for any application environment.

## 3.2 Firmware Upgrade

Beginning with revision 8.1, the firmware of the GLK240128-25/GLT240128 can be upgraded in the field. All firmware revisions can be installed using software found at <a href="https://www.matrixorbital.ca/software/GLT">www.matrixorbital.ca/software/GLT</a> <a href="https://www.matrixorbital.ca/software/GLT">Series</a>.

If it is necessary to forgo all current and future upgrades to the filesystem and subsequent commands, firmware revision 8.0 may be ordered as a part of a custom order. Please use the Contact section to request more information from the Matrix Orbital sales team.

## 3.3 Application Notes

Full demonstration programs and code are available for Matrix Orbital displays in the C# language from Simple C# AppNote Pack in the Application Note section at <a href="www.matrixorbital.ca/appnotes">www.matrixorbital.ca/appnotes</a>. Difficulty increases from beginner, with the Hello World program, to advanced with the Dallas One-Wire temperature reading application.

Many additional applications are available in a number of different programming languages. These programs are meant to showcase the capability of the display and are not intended to be integrated into a final design. For additional information regarding code, please read the On Code document also found on the support site.

8

## 4 Hardware

## 4.1 Standard Model

## **Extended Communication/Power Header**

Figure 7: Extended Communication/Power Header

Table 4: Extended Communication/Power Pinout

Pin	Function
1	Vcc
2	Rx (SCL)
3	Tx (SDA)
4	Gnd
5	CTS
6	RTS

The Extended Communication/Power Header provides a standard connector for interfacing to the GLK240128-25/GLT240128. Voltage is applied through pins one and four of the four pin Communication/Power Header. Please ensure the correct voltage input for your display by referencing Voltage Specifications before connecting power. Pins two and three are reserved for serial transmission, using either the RS-232/TTL or clocking data through the I<sup>2</sup>C protocol, depending on what has been selected by the Protocol Select Jumpers. Pins five and six can be used for serial transmission hardware flow control, and are ignored for I<sup>2</sup>C communications. The Molex 22-04-1061 style header used can be mated to a number of connectors, a 22-01-1062 for example.

## **Serial DB9 Connector**

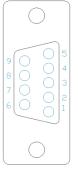

Figure 8: Serial DB9 Connector

Table 5: Serial DB9 Pinout

Pin	Function
2	Tx
3	Rx
5	Gnd
7	CTS
8	RTS
9	NC/Vcc*

The GLK240128-25/GLT240128 provides a DB-9 Connector to readily interface with serial devices using EIA232 standard signal levels. It is also possible to communicate at TTL levels of 0 to +5V by setting the Protocol Select Jumpers to TTL. As an added feature it is also possible to apply power through pin 9 of the DB-9 Connector in order to reduce cable clutter. A standard male DB9 header will provide the perfect mate for this connector.

\*Note: Do not apply voltage through pin 9 of the DB-9 Connector AND through the Communication/Power Header at the same time.

## Power Through DB9 Jumper

In order to provide power through pin 9 of the DB-9 Connector you must connect the Power Through DB-9 Jumper labelled R82, as illustrated below. This connection can be made using a zero ohm resistor, recommended size 0603, or a solder bridge. The GLK240128-25/GLT240128 allows all voltage models to use the power through DB-9 option, see the Voltage Specifications for power requirements.

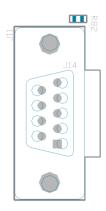

Figure 9: Power Through DB9 Jumper

## **Protocol Select Jumpers**

The Protocol Select Jumpers provide the means necessary to toggle the GLK240128-25/GLT240128 between RS-232, TTL and I<sup>2</sup>C protocols. As a default, the jumpers are set to RS-232 mode with solder jumps on the RS232 jumpers. In order to place the display module in I<sup>2</sup>C mode you must first remove the solder jumps from the RS232 jumpers and then place them on the I<sup>2</sup>C jumpers. The display will now be in I<sup>2</sup>C mode and have a default slave address of 80, unless changed with the appropriate command. Similarly, in order to change the display to TTL mode, simply remove the zero ohm resistors from the RS232 or I<sup>2</sup>C jumpers and solder them to the TTL jumpers.

## **Hardware Lock**

The Hardware Lock allows fonts, bitmaps, and settings to be saved, unaltered by any commands. By connecting the two pads near the memory chip, designated R60, with a zero ohm resistor, the display will be locked. This supersedes the data lock command and cannot be circumvented by any software means. To unlock the display and make changes simply remove the jumper.

## 4.2 USB Model

#### Mini USB Connector

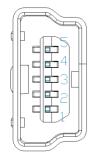

Figure 10: Mini USB Connector

Table 6: Mini USB Pinout

Pin	Function
1	Vcc
2	D-
3	D+
5	Gnd

The GLK240128-25-USB/GLT240128-USB comes with a familiar Mini USB Connector to fulfill both communication and power needs\*. The standard MiniB style header can be connected to any other USB style using the appropriate cable. Most commonly used with a PC, this connection creates a virtual comport that offers a simple power solution with a familiar communication scheme.

#### Alternate USB Header

Some advanced applications may prefer the straight four pin connection offered through the Optional Alternate USB Header. This header offers power and communication access in a simple interface package. The Optional Alternate USB Header may be added to the GLK240128-25-USB/GLT240128-USB for an added charge as part of a custom order. Please use the Contact section to request more information from the friendly Matrix Orbital sales team.

## **Alternate Power Connector**

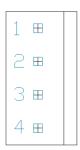

Figure 11: Alternate Power Connector

Table 7: Alternate Power Pinout

Pin	Function
1	Vcc
2	Gnd
3	Gnd
4	NC

The Alternate Power Connector provides the ability to power the GLK240128-25-USB/GLT240128-USB using a second cable\*. The Tyco 171825-4 style header is particularly useful for connecting to an unmodified floppy power cable, a 171822-4 for example, from a PC power supply for a simple bench power solution.

\*Note: The YG version of the GLK240128-25-USB/GLT240128-USB may draw more than the 500mA of current permitted by USB standards and will require the alternate power connection.

## 4.3 RS422 Model

#### RS422 Header

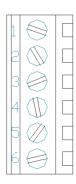

Figure 12: RS422 Header

Table 8: RS422 Pinout

Pin	Function
1	Gnd
2	Rx (Y)
3	Inv Rx (Z)
4	Inv Tx (B)
5	Tx (A)
6	Vcc

The six pin RS422 interface header of the GLK240128-25-422/GLT240128-422 offers power and ground connections as well as two differential pair communication lines. Regular and inverted lines are provided for both receive and transmit signals. Power is supplied locally to the regular or –V variants while the –VPT can receive power over a distance. The Tyco 282834-6 style header is most suited to a simple wire connection.

#### **Alternate Power Connector**

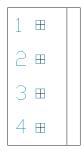

Figure 13: Alternate Power Connector

Table 9: Alternate Power Pinout

Pin	Function
1	Vcc
2	Gnd
3	Gnd
4	NC

The Alternate Power Connector provides the ability to power the GLK240128-25-USB/GLT240128-USB using a second cable. The Tyco 171825-4 style header is particularly useful for connecting to an unmodified floppy power cable, a 171822-4 for example, from a PC power supply for a simple bench power solution.

## 4.4 GLK Model

## **Keypad Header**

Figure 14: Keypad Header

Table 10: Keypad Pinout

Pin	Function	Pin	Function
1	Gnd	7	Column 1
2	Row 1	8	Column 2
3	Row 2	9	Column 3
4	Row 3	10	Column 4
5	Row 4	11	Column 5
6	Row 5	12	Gnd/Vcc*

To facilitate user input, the GLK240128-25 provides a Keypad Interface Connector which allows a matrix style keypad of up to twenty-five keys to be directly connected to the display module. Key presses are generated when a short is detected between a row and a column. When a key press is generated, a character specific to that key press is automatically sent on the Tx communication line. If a synchronous read method is desired in serial mode\*, the "Auto Transmit Keypress" function can be turned off to allow the key presses to remain in the buffer so that they may be polled. The character that is associated with each key press may also be altered using the "Assign Key Codes" command. The straight twelve pin header of the Keypad Interface Connector will interface to a variety of different devices including the Matrix Orbital KPP4x4 keypad.

<sup>\*</sup>Note: In I<sup>2</sup>C mode, the "Auto Transmit Keypress" function should always be on, keypresses should not be polled.

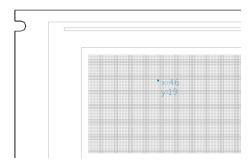

<sup>\*\*</sup>Note: The Ground / +5V pin is toggled by the jumper to the right of the keypad connector. Jump pads 1 & 2 for +5V or 2 & 3 for GND.

## 4.5 GLT Model

#### **Touch Screen**

The GLT240128 facilitates user touch input in one of two distinct ways. Coordinate mode will report events by supplying their exact position on the screen. Region mode will report events within defined boundaries on the screen. Both modes are outlined below.

## **Coordinate Mode**

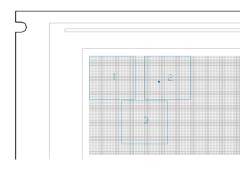

In coordinate mode all touch events are reported using three single byte values. First, the type of event is transmitted, followed by the x and y coordinates of its position. Pressure and drag thresholds must be exceeded for an event to be registered. A low drag threshold will result in greater tracking accuracy but transmits much more data to the host. Care should be taken to find balance. This mode offers a great degree of flexibility and creativity.

Table 11: Coordinate Mode Event Prefixes

Return Value	1	2	4
Touch Event	Press	Release	Drag

## **Region Mode**

A simpler, keypad style alternative to coordinate mode, region mode offers only a single byte for each touch event. Unique regions are created by specifying a position, size, and return values. A value corresponding to a specific region is returned when an event occurs within its bounds. Events outside of regions result in transmission of the value 255. Regions can be deleted individually or collectively when no longer needed. This mode allows quick and easy set up.

Table 12: Region Mode Event Responses

Return Value	Key Down	Key Up	Key Down	255
Touch Event	Press	Release	Drag	Out of Region

## 4.6 Common Features

## **General Purpose Outputs**

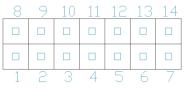

Figure 15: GPO Header

Table 13: GPO Pinout

Pin	Function	Pin	Function
1	GPO 1	8	Gnd
2	GPO 2	9	Gnd
3	GPO 3	10	Gnd
4	GPO 4	11	Gnd
5	GPO 5	12	Gnd
6	GPO 6	13	Gnd
7	Vcc	14	Gnd

A unique feature of the GLK240128-25/GLT240128 is the ability to control relays\* and other external devices using either one or six General Purpose Outputs. Each can source up to 10mA of current at five volts when on or sink 20mA at zero volts when off. The two row, fourteen pin header can be interfaced to a number of female connectors to provide control to any peripheral devices required.

\*Note: If connecting a relay, be sure that it is fully clamped using a diode and capacitor in order to absorb any electro-motive force (EMF) which will be generated.

## **Dallas One-Wire Connector**

Figure 16: Dallas One-Wire Connector

Table 14: Dallas One-Wire Pinout

Pin	Function
1	Vcc
2	D
3	Gnd

In addition to the six general purpose outputs the GLK240128-25/GLT240128 offers an Optional Dallas One-Wire bridge, to allow for an additional thirty two one-wire devices to be connected to the display. This header can be populated with a Tyco 173979 connector at an added cost by custom order only. Please use the Contact section to request more information from the Matrix Orbital sales team.

## **5** Troubleshooting

## 5.1 Power

In order for your Matrix Orbital display to function correctly, it must be supplied with the appropriate power. If the power LED near the top right corner of the board is not illuminated, power is not applied correctly. Try following the tips below.

- First, check the power cable which you are using for continuity. If you don't have an ohm meter, try using a different power cable, if this does not help try using a different power supply.
- If power is applied through the DB9 connector, ensure that the Power Through DB9 Jumper is connected.
- If changes have been made to the protocol select block, ensure all the appropriate protocol select jumpers are connected and all unused protocol jumpers are disconnected.
- The last step will be to check the interface connector in use on your display. If the power connections have become loose, or you are unable to resolve the issue, please Contact Matrix Orbital for more information.

## 5.2 Display

If your display is powered successfully, the Matrix Orbital logo, or user created screen should display on start up. If this is not the case, check out these tips.

- Ensure the contrast is not too high or too low. This can result in a darkened or blank screen respectively. See the Manual Override section to reset to default.
- Make sure that the start screen is not blank. It is possible to overwrite the Matrix Orbital logo start screen, if this happens the screen may be blank. Try writing to the display to ensure it is functional, after checking the contrast above.

## 5.3 Communication

When communication of either text or commands is interrupted, try the steps below.

- First, check the communication cable for continuity. If you don't have an ohm meter, try using a different communication cable. If you are using a PC try using a different Com/USB Port.
- Next, please ensure that the display module is set to communicate on the protocol that you are using, by checking the Protocol Select Jumpers.
- In serial and USB protocols, ensure that the host system and display module are both communicating on the same baud rate. The default rate for the display module is 19200 bps.
- Match Rx from your display to the transmitting pin from your host and the Tx pin to the receiving pin.
- If you are communicating to the display via I<sup>2</sup>C\* please ensure that the data is being sent to the correct address. The default slave address for the display module is 80.
- In I<sup>2</sup>C mode, connect Rx to the clock line of your controller and Tx to the data output.
- Unlock the display. See the Set and Save Data Lock command for more info.
- Finally, you may reset the display to its default settings using the Manual Override procedure outlined below.

## 5.4 Manual Override

Should the settings of your display become altered in a way that dramatically impacts usability, the default settings can be temporarily restored. To override the display, please follow the steps below.

- 1. Disconnect power from your display.
- 2. Place a jumper on the two manual override pins, for the GLK240128-25 model these are the middle two keypad pins, for the GLT240128 these are the two pins near the keypad header.
- 3. Reconnect power to your unit, and wait for the start screen before removing the jumper. Please note the jumper will adversely affect GLT240128 performance if left in place during use.
- 4. Settings will be temporarily\*\* overridden to the defaults listed in the Manual Override Settings table. At this point any important settings, such as contrast, backlight, or baud rate, should not only be set but saved so they remain when the override is removed.

Parameter	Value
Backlight	255
Contrast	128
Baud Rate	19200
I <sup>2</sup> C Address	80

Table 15: Manual Override Settings

<sup>\*</sup>Note: I<sup>2</sup>C communication will always require pull up resistors on SCL and SDA of one to ten kilohms.

<sup>\*\*</sup>Note: The display module will revert back to the old settings once turned off, unless desired settings are saved.

## 6 Commands

## 6.1 Communication

1.1 Change	Dec	254 57	Speed	v8.0
Baud Rate	Hex	FE 39	Speed	
	ASCII	<b>9</b>	Speed	
Immediately ch	nanges the	baud rate.	Not available in I2C. Baud rate can be temporarily forced to 19200 by a	
manual overric	le.			
Speed Byte	Valid sett	tings shown	below.	

Table 16: Accepted Baud Rate Values

Rate	9600	14400	19200	28800	38400	57600	76800	115200
Speed	207	138	103	68	51	34	25	16

1.2 Change I2C Slave Address	Dec Hex		Address Address	v8.0
Jiave Address	ASCII		71001 000	
Immediately char	nges the I2C	write addr	ress. Only even values are permitted as the next odd addi	ress will become
the read address	Default is	80.		
Address Byte	Even value	e.		

1.3 Transmission	Dec 254	Protocol	v8.0
Protocol Select	Hex 160	Protocol	
	ASCII FE A	Protocol	
	■ 6	i	

Selects the protocol used for data transmission from the display. Data transmission to the display is not affected. Must be set to the protocol in use to receive data correctly.

Protocol Byte 1 for Serial (RS232/RS422/TTL/USB) or 0 for I2C.

1.4 Set Flow	Dec	254 63	Mode	v8.0
Control Mode	Hex	FE 3F	Mode	
	ASCII	<b>?</b>	Mode	

Toggles flow control between hardware, software and off settings. Software and Hardware control can be further tuned using the settings above. Default is Hardware, or 2.

Mode Byte Flow control setting as below.

Table 17: Hardware Flow Control Trigger Levels

Bytes	1	4	8	14
Level	0	1	2	3

Flow Control	None	Software	Hardware
Mode	0	1	2

Table 18: Flow Control Settings

1.5 Set Hardware	Dec	254 62	Level	,
Flow Control	Hex	FE 3E	Level	
Trigger Level	ASCII	= >	Level	

Sets the hardware flow control trigger level. The Clear To Send signal will be deactivated once the number of characters in the display buffer reaches the level set; it will be reactivated once all data in the buffer is handled.

Level Byte Trigger level as above.

1.6 Turn	Dec	254 58	Full Empty	v8.0
Software Flow	Hex	FE 3A	Full Empty	
Control On	ASCII	<b>=</b> :	Full Empty	

Enables simple flow control. The display will return a single, Xoff, byte to the host when the display buffer is almost full and a different, Xon, byte when the buffer is almost empty. Full value should provide enough room for the largest data packet to be received without buffer overflow. No data should be sent to the display between full and empty responses to permit processing. Buffer size is 128 bytes. Not available in I<sup>2</sup>C. Default off.

Full	Byte	Number of bytes remaining before buffer is completely full, 0 < Full < Empty < 128.
Empty	Byte	Number of bytes remaining before buffer can be considered empty enough to accept data.

Disables flow control. Bytes sent to the display may be permitted to overflow the buffer resulting in data loss.

1.8 Set Software	Dec	<b>254</b> )	Xon Xoff	v8.0
Flow Control	Hex		Xon Xoff	
Response	ASCII		Xon Xoff	
		3C		
		<b>■</b> <		

Sets the values returned for almost full and almost empty messages when in flow control mode. This command permits the display to utilize standard flow control values of 0x11 and 0x13, note that defaults are 0xFF and 0xFE.

Xon	Byte	Value returned when display buffer is almost empty, permitting transmission to resume.
Xoff	Byte	Value returned when display buffer is almost full, signaling transmission to halt.

1.9 Echo	Dec	254 255	Length Data	v8.3
	Hex	FE FF	Length Data	
	ASCII	•	Length Data	
Send data to	o the displ	ay that it will	echo. Useful to confirm communication or return information from scripts	5.
Length	Short	Length of d	data array to be echoed.	
Data	Byte(s)	An arbitrar	ry array of data that the module will return.	
Response	Byte(s)	The same a	rbitrary array of data originally sent.	

1.10 Delay	Dec	254 251	Time
	Hex	FE FB	Time
	ASCII	■ <b>√</b>	Time

Pause command execution to and responses from the display for the specified length of time.

Time Short Length of delay in ms, maximum 2000.

1.11 Software	Dec	254 253 77 79 117	v8.4
Reset	Hex	110	
	ASCII F	FE FD 4D 4F 75 6E	
		■ <sup>2</sup> M O u n	

Reset the display as if power had been cycled via a software command. No commands should be sent while the unit is in the process of resetting; a response will be returned to indicate the unit has successfully been reset.

Response Short Successful reset response, 254 212.

## 6.2 Text

2.1 Clear D	ec <b>254 88</b>	
Screen H	ex FE 58	
A	SCII X	

Clears the contents of the screen.

2.2 Go	Dec	254 72	
Home	Hex	FE 48	
	ASCII	■ H	

Returns the cursor to the top left of the screen.

2.3 Set Cu	irsor	Dec 254 7	Column Row	v8.0				
Position			Column Row					
		ASCII • C	Column Row					
Sets the co	ursor to	a specific cursor p	osition where the next transmitted character is printed.					
Column	Byte	Value between 1	and number of character columns.					
Row	Byte	Value between 1	alue between 1 and number of character rows.					

2.4	Set Curso	or Dec	254	ХҮ	v8.0			
Coc	ordinate	Hex	121	XY				
		ASCII	FE 79	XY				
			<b>■</b> y					
Set	Sets the cursor to an exact pixel position where the next transmitted character is printed.							
X	Byte	Value between	/alue between 1 and screen width, represents leftmost character position.					
Υ	Byte	Value between	Value between 1 and screen height, represents topmost character position.					

2.5 Initialize		vec 254 43 ID X1 Y1 X2 Y2 FontID CharSpace LineSpace Scroll v8.3					
Text Window	v F	lex FE 2B ID X1 Y1 X2 Y2 FontID CharSpace LineSpace Scroll					
	A	SCII TO X1 Y1 X2 Y2 FontID CharSpace LineSpace Scroll					
Designates a	portion	of the screen to which text can be confined. Font commands affect only the current window,					
default (entir	re scree	n) is window 0.					
ID	Byte	Unique text window identification number, between 0 and 15.					
X1	Byte	Leftmost coordinate.					
Y1	Byte	Topmost coordinate.					
X2	Byte	Rightmost coordinate.					
Y2	Byte	ottommost coordinate.					
FontID	Byte	Unique font to use for this window.					
CharSpace	Byte	Spacing between characters to use for this window.					
LineSpace	Byte	Spacing between lines to use for this window.					
Scroll	Byte	Number of pixel rows to write to before scrolling text.					

2.6 Set Text	Dec	254 42	ID	
Window	Hex	FE 2A	ID	
	ASCII	<b>*</b>	ID	

Sets the text window to which subsequent text and commands will apply. Default (entire screen) is window 0.

ID Byte Unique text window to use.

2.7 Clear Text	Dec	254 44	ID	v8.3
Window	Hex	FE 2C	ID	
	ASCII	■,	ID	

Clear the contents of a specific text window, similar to the clear screen command.

ID Byte Unique text window to clear.

2.8 Initialize	Dec	254 45 ID X1 Y1 X2 Y2 Vert Hor Font Background CharSpace v8.3				
Label	Hex	FE 2D ID X1 Y1 X2 Y2 Vert Hor Font Background CharSpace				
	ASCII	■ - ID X1 Y1 X2 Y2 Vert Hor Font Background CharSpace				
Designates a p	ortion of	the screen that can be easily updated with one line of text, often used to display variables.				
ID	Byte	Unique label identification number, between 0 and 15.				
X1	Byte	Leftmost coordinate.				
Y1	Byte	Topmost coordinate.				
X2	Byte	Rightmost coordinate.				
Y2	Byte	Bottommost coordinate.				
Vert	Byte	/ertical justification of the label text; 0 for top, 1 for middle, or 2 for bottom.				
Hor	Byte	Horizontal justification of the label text; 0 for left, 1 for centre, or 2 for right.				
Font	Byte	Unique font to use for this label.				
Background	Byte	State of the pixels in the label region that is not occupied by text; 0 for off or 1 for on.				
CharSpace	Byte	Spacing between characters to use for this label.				

2.9 Upo	date	Dec	254 46	ID Data		v8.3
Label		Hex	FE 2E	ID Data		
		ASCII	■.	ID Data		
Update	a previo	usly creat	ed label with	new text.	Send a null character (empty string) to clear a label.	
ID	Byte	Unique la	abel to updat	e, betweer	n 0 and 15.	
Data	String	Informat	ion to display	in the labe	el, must be terminated with a null (value of zero) byte.	

2.10 Auto Scroll	Dec	254 81		
On	Hex	FE 51		
	ASCII	<b>■</b> Q		

The entire contents of screen are shifted up one line when the end of the screen is reached. Display default is on.

2.11 Auto Scroll	Dec	254 82
Auto Scroll	Dec	
Off	Hex	FE 52
ווע		_
	ASCII	■ R

New text is written over the top line when the end of the screen is reached. Display default is Auto Scroll on.

## 6.3 Drawing

3.1 Set Drawing	Dec	254 99	Colour	v8.0	
Colour	Hex	FE 63	Colour		
	ASCII	■ C	Colour		
Set the colour to be used for all future drawing commands that do not implicitly specify colour.					

Colour Byte 0 for background or any other value for text colour.

3.2	Draw	Dec 254 112 X Y	v8.0					
Pixe	el	Hex FE 70 X Y						
		ASCII ■ P X Y						
Dra	ıw a singl	le pixel at the specified coordinate using the current drawing colour.						
X	Byte	Horizontal position of pixel to be drawn.						
Υ	Byte	Vertical position of pixel to be drawn.						

3.3 D	raw a	Dec	254	X1 Y1 X2 Y2 <b>v8.0</b>
Line		Hex	108	X1 Y1 X2 Y2
		ASCII	FE 6C	X1 Y1 X2 Y2
			■ I	
Draw	a line co	onnecting	two termini.	Lines may be rendered differently when drawn right to left versus left to right.
X1	Byte	Horizon	tal coordinat	e of first terminus.

X1	Byte	Horizontal coordinate of first terminus.
Y1	Byte	Vertical coordinate of first terminus.
X2	Byte	Horizontal coordinate of second terminus.
Y2	Byte	Vertical coordinate of second terminus.

3.4	4 Continue	a Dec <b>254</b>	XY	v8.0

Shift the	specified	l strip cha	rt and draw a	new value.				
ID	Byte	Chart ide	entification n	umber, value	between 0 and 7.			
Value	Short	Value to	Value to add to the chart.					

## 6.4 Fonts

4.1 Up	load a	Dec 254 36	ID Size Data	/8.0					
Font Fi	le	Hex <b>FE 24</b>	ID Size Data						
		ASCII •\$	ID Size Data						
Upload	Upload a font to a graphic display. To create a font see the Font File Creation section, for upload protocol see the								
File Tra	File Transfer Protocol or XModem Transfer Protocol entries. Default font is ID 1.								
ID*	Short	Unique font ident	Unique font identification number, value between 0 and 1023.						
Size*	Integer	Size of the entire	Size of the entire font file.						
Data	Byte(s)	Font file data, see	Font file data, see the Font File Creation example.						

<sup>\*</sup>Note: ID and Size were changed from Byte and Short lengths respectively at firmware revision 8.1

4.2 Set the	Dec	254 49	ID	v8.0
Current Font	Hex	FE 31	ID	
	ASCII	<b>1</b>	ID	

Set the font in use by specifying a unique identification number. Characters sent after the command will appear in the font specified; previous text will not be affected. Default is 1.

Short Unique font identification number, value between 0 and 1023.

<sup>\*</sup>Note: ID was changed from a Byte length at firmware revision 8.1

4.3 Set Font	Dec	254 50 LineMargin TopMargin CharSpace LineSpace Scroll v8.0						
Metrics	Hex	FE 32 LineMargin TopMargin CharSpace LineSpace Scroll						
	ASCII	■ 2 LineMargin TopMargin CharSpace LineSpace Scroll						
Set the font sp	pacing, or	r metrics, used with the current font. Changes only appear in text sent after command.						
LineMargin	Byte	Space between left of display and first column of text. Default 0.						
TopMargin	Byte	pace between top of display area and first row of text. Default 0.						
CharSpace	Byte	pace between characters. Default 0.						
Line Space	Byte	pace between character rows. Default 1.						
Scroll	Byte	Point at which text scrolls up screen to display additional rows. Default 1.						

4.4 Set Box Space	Dec	254 172	Switch	v8.0
Mode	Hex	FE AC	Switch	
	ASCII	<b>1</b> / <sub>4</sub>	Switch	

Toggle box space on or off. When on, a character sized box is cleared from the screen before a character is written. This eliminates any text or bitmap remnants behind the character. Default is on.

Switch Byte 1 for on or 0 for off.

28

#### **Font File Creation**

Matrix Orbital graphic displays are capable of displaying text in a wide variety of styles customizable to suit any project design. Font files alter the style of text and appearance of the display.

By default, a Matrix Orbital graphic display is loaded with a "Small Filled" font in slot one and a "Future BK BT 16" style in slot two. Both are available at <a href="https://www.matrixorbital.ca/software/graphic">www.matrixorbital.ca/software/graphic</a> fonts.

The easiest way to create, add, or modify the fonts of any graphic display is through the MOGD# tool. This provides a simple graphic interface that hides the more complex intricacies of the font file.

Table 22: Example Font File Header

Maximum Width	Character Height	ASCII Start Value	ASCII End Value	
5	7	72	74	

The font file header contains four bytes: First, the number of columns in the widest character; usually 'W', second, the pixel height of each character, and finally, the start and end values of the character range. The range represents the values that must be sent to the display to trigger the characters to appear on the screen. In the example, the decimal values corresponding to the lowercase letters 'h' through 'j' will be used resulting in the range shown.

Table 23: Example Character Table

	MSB	LSB	Width
h	0	13	5
i	0	18	3
j	0	21	4

The character table contains information that allows the display to locate each individual character in a mass of character data. Each character has three bytes; two indicating it's offset in the character data and one indicating its width. The offset takes into account the header and table bytes to point to the first byte of the character data it references. The first byte of the file, maximum width, has an offset of zero. The width byte of each character can be identical as in a fixed width font, or in our case, variable. The character table will become clearer after analyzing the final part of the font file, character data.

Table 24: Character 'h'
Bitmap

1	0	0		
1			0	0
1	0	1	1	0
1	1	0		1
1	0	0		1
1	0	0	0	1
1	0			1

Table 25: Character 'h' Data

1	0	0	0	0	1	0	0	84	132
0	0	1	0	1	1	0	1	2D	45
1			1	1				98	152
1	1	0	0	0	1	1	0	C6	198
0	0	1	0	0	0	0		20	32

The character data is a binary graphical representation of each glyph in a font. Each character is drawn on a grid containing as many rows as the height specified in the header and as many columns as the width specified in the character table. Cells are drawn by writing a one in their location and cleared by setting a value of zero. Starting at the top left, moving right, then down, eight of these cells form a character data byte. When all cells are accounted for, zeroes may be added to the last byte to complete it. A sample of an 'h' glyph is shown above. The data for the 'i' and 'j' characters will follow to complete the custom font file displayed below.

Table 26: Example Font File

Header		5 7 72 74
Character Table	h	0 13 5
	i	0 18 3
	j	0 21 4
Character Data	h	132 45 152 198 32
	i	67 36 184
	j	16 49 25 96

## 6.5 Bitmaps

5.1 Upl	oad a Dec	254 94	ID Size Data	v8.0
Bitmap	File Hex	FE 5E	ID Size Data	
	ASCII	<b>^</b>	ID Size Data	
Upload	a bitmap to a gra	aphic display. To	create a bitmap see the	
Bitmap	File Creation sec	tion, for upload p	protocol see the	
File Trai	nsfer Protocol or	XModem Transfe	er Protocol entries. Start screen is ID 1.	
ID*	Short	Unique bitmap	identification number, value between 0 and 1023.	
Size*	Integer	Size of the entir	re bitmap file.

X1	Byte Leftmost coordinate of bitmap.						
Y1	Byte	opmost coordinate of bitmap.					
Data	Byte(s)	Bitmap file data, see the Bitmap File Creation example.					

#### **Bitmap File Creation**

In addition to fonts, Matrix Orbital graphic displays can also hold a number of customizable bitmaps to provide further stylistic product integration. Like font files, bitmaps files are most easily uploaded to a display using MOGD#. However, the critical data component of the bitmap upload command is detailed below for reference.

The bitmap data block is similar to that of a font. However, as a bitmap is a single glyph, only a simple two byte header is required. First, one byte representing the bitmap width is sent, then one byte for the height. Each bitmap is merely encoded in binary fashion using a series of ones and zeroes. Again a grid can be created using the width and height specified in the upload command, populated in the manner above, and converted into byte values. A smiley face example is shown below to indicate the ultimate affect of the Matrix Orbital graphic stylization ability.

Table 27: Smiley Face Bitmap

	1		1	
			0	0
1	0	0	0	1
0	1	1	1	0

Table 28:Smiley Face Data

(	0	1	0	1					50	80
(	0	0	1	0	0	0	1	0	22	34
1	1	1	1						E0	224

Table 29: Example Bitmap File

Header	5 4
Bitmap Data	80 34 224

#### **Bitmap Masking**

Like a regular bitmap, a mask can be loaded to the display and used to create a more polished result when drawing in populated areas. When defining a mask, all active values will clear any background information, while any inactive values will leave it untouched. This is best described with an example.

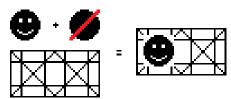

Figure 17: Drawing without a Mask

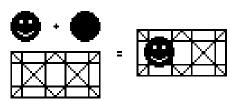

Figure 18: Drawing with a Mask

#### **6.6 9-Slices**

6.1 Upload a	Dec	254 92	ID Size Data	v8.3
9-Slice File	Hex	3	ID Size Data	
	ASCII	FE 5C	ID Size Data	
		03		
		■ \ ETX		

Upload a 9-slice file to a graphic display. To create a 9-slice see the 9-Slice File Creation section, for upload protocol see the

File Transfer Protocol or XModem Transfer Protocol entries.

ID	Short	Unique 9-slice identification number, value between 0 and 1023.
Size	Integer	Size of the 9-slice file.
Data	Byte(s)	9-slice file data, see the 9-Slice File Creation example.

6.2 Upload a 9-	Dec <b>25</b> 4	92 ID Size Data	v8.3
Slice Mask	Hex	6 ID Size Data	
	ASCII FE	<b>5C</b> ID Size Data	
		06	
	<b>■</b> \	ACK	

Upload a 9-slice mask that can clear areas of the screen before a 9-slice is drawn. Programmatically, (9slice&mask) | (screen&~mask) is shown when a bitmap is drawn. To create a mask see the 9-Slice File Creation section, for upload protocol see the

File Transfer Protocol or XModem Transfer Protocol entries.

ID	Short	Unique 9-slice mask identification number, value between 0 and 1023.
Size	Integer	Size of the entire mask file.
Data	Byte(s)	9-slice mask file data, see the 9-Slice File Creation example.

6.3 D	isplay a	<b>Dec 254 91</b> ID X1 Y1 X2 Y2	v8.3					
9-Slic	e	Hex FE 5B ID X1 Y1 X2 Y2						
		ASCII ■ ID X1 Y1 X2 Y2						
Displ	ays a pre	iously loaded 9-slice at the specified location	n.					
ID	Short	Unique 9-slice identification number, value between 0 and 1023.						
X1	Byte	Leftmost coordinate of the 9-slice.						
Y1	Byte	Topmost coordinate of the 9-slice.						
X2	Byte	Rightmost coordinate of the 9-slice.						
Y2	Byte	Bottommost coordinate of the 9-slice.						

#### 9-Slice File Creation

A 9-slice file is a scalable graphic composed of nine different bitmap sections as shown below.

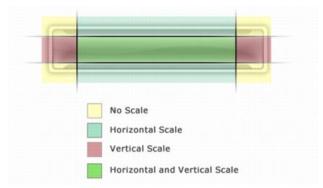

Figure 19: Adobe 9-slice Representation

The 9-slice file format requires that the bitmap dimensions and the locations of divisions be defined before a graphic is uploaded normally as shown in the Bitmap File Creation example.

Table 30: 9-slice file format

Width	One byte representing the width of the entire bitmap.
Height	One byte representing the height of the entire bitmap.
Тор	One byte specifying the height of the top row section of the 9-slice.
Bottom	One byte specifying the height of the bottom row section of the 9-slice.
Left	One byte specifying the width of the left column section of the 9-slice.
Right	One byte specifying the width of the right column section of the 9-slice.
Bitmap Data	Data outlining the entire bitmap, as per the Bitmap File Creation example.

### 6.7 Animations

7.1 Upload an	Dec	254 92	File ID Size Data v8.3
Animation File	Hex	4	File ID Size Data
	ASCII	FE 5C	File ID Size Data
		04	
		■ \ EOT	

Upload an animation file to a graphic display. To create an animation see the Animation File Creation section, for upload protocol see the

File Transfer Protocol or XModem Transfer Protocol entries.

File ID	Short	Unique animation file identification number, value between 0 and 1023.
Size	Integer	Size of the animation file.
Data	Byte(s)	Animation file data, see the Animation File Creation example.

7.2 Displa	ay	<b>Dec 254 193</b> ID File ID* X Y	v8.3
Animatio	n	Hex FE C1 ID File ID* X Y	
		ASCII ■ ID File ID* X Y	
Load the	first fran	me of the specified animation in its stopped state at the specified location. If an animation	n is
already in	n use at 1	that index it will be overwritten. Use the start animation command to play the displayed	file.
ID	Byte	Unique animation identification number.	
File ID	Short	Unique animation file identification number, value between 0 and 1023.	
X	Byte	Leftmost coordinate of animation.	
Υ	Bvte	Topmost coordinate of animation.	

<sup>\*</sup>Note: File ID short length variable was removed from this command at v8.4

7.3 D		Dec Hex ASCII	254 199 FE C7 ■   -	ID ID				v8.	
Stop and delete the displayed animation specified.

ID	Byte	Animatio	Animation number to start/stop.						
Start	Byte	Any non-	Any non-zero value will start the specified animation, 0 will stop it.						

7.5 Set	Dec	254 197	ID Frame	v8.3			
Animation	Hex	FE C5	ID Frame				
Frame	ASCII	<b>■</b> +	ID Frame				
Set the current frame of a displayed animation. If the frame exceeds the total number present, the animation will be set to the first frame.							

ID Byte Animation number to control.

Frame Byte Number of the frame to be displayed.

7.6 Get	Dec	254 196	ID	v8.3					
Animation	Hex	FE C4	ID						
Frame	ASCII	<b>-</b>	ID						
Get the curre	Get the current frame of a displayed animation.								
ID	Byte	Animation number to request frame number.							
Response	Byte	Current fram	Current frame number of the animation specified.						

#### **Animation File Creation**

An animation file is a series of bitmaps, each displayed for a specified length of time within a continuous rotation. The file begins by specifying the number of frames, the offset of each block of bitmap information, and the time to display each frame. After which bitmap headers and data are transmitted for each frame, in the same manner as the Bitmap File Creation example.

Table 31: Animation file format

Total Frames	Two bytes representing the total number of frames in the animation
Offsets	One entry for each frame, 4 bytes indicating the start of the bitmap file.
Times	Two bytes for each frame representing the length of time (100ms) for which it is displayed.
Header 1	Two bytes, one representing the width and one the height of the first bitmap.
Bitmap 1 Data	The first bitmap data, as per the Bitmap File Creation example.
Header 9	Two bytes, one representing the width and one the height of the last bitmap.
Bitmap 9 Data	The last bitmap data, as per the Bitmap File Creation example.

# 6.8 General Purpose Output

# 6.9 Piezo Buzzer

9.1 Activate	Piezo	Dec	254	Frequency Time	v8.0			
Buzzer*		Hex	187	Frequency Time				
		ASCII	FE BB	Frequency Time				
			■ 🗇					
Activates a k	Activates a buzz of specific frequency from the onboard piezo buzzer for a specified length of time.							
Frequency	Short	Freque	Frequency of buzz in hertz.					
Time	Short	*Durati	*Duration of the beep in milliseconds.					

<sup>\*</sup>Note: When a beep precedes a delay command, the duration of the beep must be shorter than that of the delay.

9.2 Set Defa	ult	Dec		Frequency D		v8.3		
Buzzer Beep		Hex	FE BC	Frequency D	uration			
		ASCII	■ ╝	Frequency D	uration			
Set the frequ	uency an	d duration	of the defau	It beep transm	nitted when the bell character is transmitted.			
Frequency	Frequency Short Frequency of the beep in Hertz, default 440Hz.							
Duration	Short	Duration	Duration of the beep in milliseconds, default 100ms.					

9.3 Set Keyp	ad	Dec	254 182	Frequency Duration	v8.4			
Buzzer Beep		Hex	FE B6	Frequency Duration				
		ASCII	■ -	Frequency Duration				
Set the frequ	uency an	d duration	of the defau	Ilt beep transmitted when a key is pressed.				
Frequency	Short	Frequenc	Frequency of the beep in Hertz, default is 0 or off.					
Duration	Short	Duration	rration of the beep in milliseconds, default is 0 or off.					

9.4 Set Touch		Dec 254 182	Down Freq Up Freq	v8.4			
Buzzer Beep		Hex FE B6	Down Freq Up Freq				
		ASCII -	Down Freq Up Freq				
Set the freque	ency of t	he default beep trar	smitted when a touch event occurs. Duration of each is 50ms.				
Down Freq Short Frequency of the down event beep in Hertz, default is 0 or off.							
Up Freq	Short	Frequency of the up event beep in Hertz, default is 0 or off.					

### 6.10 Keypad

10.1 Auto	Dec	254 65	
Transmit Key	Hex	FE 41	
Presses On	ASCII	■ A	

Key presses are automatically sent to the host when received by the display. Use this mode for I2C transactions.

10.2 Auto	Dec 254 79
Transmit Key	Hex FE 4F
Presses Off	ASCII • O

Key presses are held in the 10 key buffer to be polled by the host using the Poll Key Press command. Default is Auto Transmit on.

10.3 Poll Key	Dec	254 38		
Press	Hex	FE 26		
	ASCII	■ &		

Reads the last unread key press from the 10 key display buffer. If another key is stored in the buffer the MSb will be 1, the MSb will be 0 when the last key press is read. If there are no stored key presses a value of 0 will be returned. Auto transmit key presses must be turned off for this command to be successful, do not use with I<sup>2</sup>C.

Response Byte Value of key pressed (MSb determines additional keys to be read).

10.4 Clear	Dec	254 69		
Key Buffer	Hex	FE 45		
	ASCII	■ E		

Clears all key presses from the key buffer.

10.5 Set	Dec	254 85	Time	v8.0
Debounce Time	Hex	FE 55	Time	
	ASCII	■ U	Time	

Sets the time between a key press and a key read by the display. Most switches will bounce when pressed; the debounce time allows the switch to settle for an accurate read. Default is 8 representing approximately 52ms.

Time Byte Debounce increment (debounce time = Time \* 6.554ms).

10.6 Set Auto	Dec	254 126	Mode	v8.
10.0 3007100	200		Wode	
Repeat Mode	Hex	FE 7E	Mode	
	ASCII	■ DEL	Mode	

Sets key press repeat mode to typematic or hold. In typematic mode if a key press is held, by default the key value is transmitted immediately, then 5 times a second after a 1 second delay. In hold mode, the key down value is transmitted once when pressed, and then the key up value is sent when the key is released. Default is typematic.

Mode Byte 1 for hold mode or 0 for typematic.

Turns auto repeat mode off. Default is on (typematic).

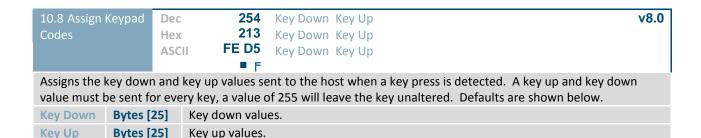

Table 32: Default Key Down Values

	ŀ	Key Dowr	1	
A(65)	B(66)	C(67)	D(68)	E(69)

Sets the de	elay betw	een the first key pres	ss and first typematic report when a key is held in typematic mode.	
Delay B	<b>yte</b> Tir	me key must be held	to trigger typematic reports, specified in 100ms, default is 10 (1s).	

10.10 Set	Dec	254 158	Interval	v8.4
Typematic	Hex	FE 9E	Interval	
Interval	ASCII	■ Pts	Interval	

Sets the interval between reported key presses when a key is held and the display is in typematic mode.

Interval Byte Time between key reports, specified in 100ms increments, default is 2 (200ms).

### 6.11 Touchpad

11.1 Set Touch	Dec	254 135	Mode	v8.0
Mode	Hex	FE 87	Mode	
	ASCII	■ ç	Mode	
C - 4 - 4   4		. a		Design and a will ask on a single value for execute in defined and

Sets the method used to return touch events. Region mode will return a single value for events in defined areas. Coordinate mode will return event, x position, and y position bytes for each press, drag, or release.

Mode Byte Touch reporting mode, 0 for region or 1 for coordinate mode. Default is coordinate.

11.2 Set Region	Dec	254 136	Mode	v8.0
Reporting Mode	Hex	FE 88	Mode	
	ASCII	<b>■</b> ê	Mode	

Defines the events transmitted in region mode. Allows only events specified to return a value to the host. Key down values are transmitted for press and drag events, key up for release, and the value 255 for out of region.

Mode Byte Defines the events reported, see Region Reporting Mode. Default reporting returns all events.

Table 34: Region Reporting Mode

Bit	7-4	3	2	1	0

33	Vertical slider, starting at maximum position
64	Horizontal slider, starting at middle position
65	Vertical slider, starting at middle position

11.7 Delete a	Dec	254 189	ID	
Slider	Hex	FE BD	ID	
	ASCII	■ 川	ID	

Deletes a previously created slider. Memory is shared with touch regions, this command will free space.

ID Byte Unique region identification number.

11.8 Delete	Dec	254 190
All Sliders	Hex	FE BE
	ASCII	■ ∃

Deletes all previously created sliders. Does not remove touch regions.

11.9 Set	Dec	254 137	Threshold	v8.0
Dragging	Hex	FE 89	Threshold	
Threshold	ASCII	■ë	Threshold	

Sets the distance a press is required to travel before a drag event is reported. Precision will vary inversely to data transmitted; care should be taken to find a suitable balance. Distance is calculated as  $\Delta x^2 + \Delta y^2 = d^2$ .

Threshold Byte Dragging threshold value. Default is 8.

11.10 Set	Dec	254 138	Threshold v8.0
Pressure	Hex	FE 8A	Threshold
Threshold	ASCII	■è	Threshold
Sets the pre	ssure rec	uired to trigge	er a touch event.
Threshold	Short	Pressure thr	eshold value. Default is 1000.

11.11 Run	Dec	254 139
Touchpad	Hex	FE 8B
Calibration	ASCII	≡ï

Triggers an interactive calibration of the touchpad. User will be required to touch various points on the screen during calibration. This command is recommended for use when environmental or user conditions change to ensure correct operation.

Response Short Command byte 254, then 21 for success or 20 for failure.

### 6.12 Display Functions

12.1 Backlight	Dec	254 66	Minutes	v8.0
On	Hex	FE 42	Minutes	
	ASCII	■ B	Minutes	

Turns the display backlight on for a specified length of time. If an inverse display color is used this command will essentially turn on the text.

Minutes Byte Number of minutes to leave backlight on, a value of 0 leaves the display on indefinitely.

12.2 Backlight	Dec	254	v8.0
Off	Hex	70	
	ASCII	FE 46	
		■ F	

Turns the display backlight off. If an inverse display colour is used this command will turn off the text.

12.3 Set	Dec	254	Brightness	v8.0
Brightness	Hex	153	Brightness	
	ASCII	FE 99	Brightness	
		■ Ö		
Immodiately	cotc the l	hacklight hr	ightness. If an inverse display color is used this represents the text colour	

Immediately sets the backlight brightness. If an inverse display color is used this represents the text colour intensity instead. Default is 255.

Brightness Byte Brightness level from O(Dim) to 255(Bright).

12.4 Set and Save	Dec	254 152	Brightness	v8.0
Brightness	Hex	FE 98	Brightness	
	ASCII	■ÿ	Brightness	

Immediately sets and saves the backlight brightness. Although brightness can be changed using the set command, it is reset to this saved value on start up. Default is 255.

Brightness Byte Brightness level from O(Dim) to 255(Bright).

12.5 Set	Dec	254 80	Contrast	v8.0
Contrast	Hex	FE 50	Contrast	
	ASCII	■ P	Contrast	

Immediately sets the contrast between background and text. If an inverse display color is used this also represents the text brightness. Default is 128.

Contrast Byte Contrast level from O(Light) to 255(Dark).

12.6 Set and Save	Dec	254 145	Contrast	v8.0
Contrast	Hex	FE 91	Contrast	
	ASCII	■ æ	Contrast	

Immediately sets and saves the contrast between background and text. Although contrast can be changed using the set command, it is reset to this saved value on start up. Default is 128.

Contrast Byte Contrast level from O(Light) to 255(Dark).

## 6.13 Scripting

		■ a ACK 0	
Downloads a	a single f	file from the display to the host using the XModem Transfer Protocol.	
File ID	Short	Unique identification number for the file to download, value between	n 0 and 1023.
Туре	Byte	Type of file to download, see File Types .	
Response	Integer	r Size of the filesystem to download.	
	Byte(s)	Filesystem data to download, an even multiple of 128 bytes, may be p	padded with 255s.

#### File Transfer Protocol

Once a bitmap or font file has been created and paired to its command it must be sent using a file protocol developed specifically for Matrix Orbital displays. Once a file upload command has been sent requesting a unique reference number and specifying the file size required, the display will respond indicating whether it has enough room to save the file or not. As is the case throughout the upload protocol, a response of 1 will indicate confirmation while an 8 corresponds to rejection and will terminate the session.

Table 39: Upload Protocol Responses

Value	Action	Description
1	Acknowledged	Transfer successful, upload continues
8	Not Acknowledged	Transfer failed, abort upload

Once a file is confirmed to fit within the display, the upload will begin. A protocol is used here to ensure each byte is uploaded successfully. After each byte is sent, the module will echo it back to the host. It should then be checked against the value originally sent before a confirmation byte of 1 is returned. If the transmitted and echoed values do not match the upload should be aborted by sending a value of 8 instead. The upload will continue in this manner as indicated by the examples below which utilize familiar font and bitmap files.

Table 40: Font Upload Protocol

Host Comments 254 **Command Prefix** 36 **Upload Font File Command** 1 Reference ID LSB 0 Reference ID MSB 31 Font File Size LSB 0 Font File Size 0 Font File Size 0 Font File MSB Acknowledge Size 5 First Font Data Byte Echo Data Byte Acknowledge Data Byte 7 Second Font Data Byte 96 Last Font Data Byte 96 Echo Data Byte Acknowledge Data Byte

Table 41: Bitmap Upload Protocol

Host	Display	Comments
254		Command Prefix
94		Upload Bitmap File Command
1		Reference ID LSB
0		Reference ID MSB
5		Bitmap File Size LSB
0		Bitmap File Size
0		Bitmap File Size
0		Bitmap File MSB
	1	Acknowledge Size
5		First Bitmap Data Byte
	5	Echo Data Byte
1		Acknowledge Data Byte
4		Second Bitmap Data Byte
224		Last Bitmap Data Byte
	224	Echo Data Byte
1		Acknowledge Data Byte

It should be noted that the display has a timeout setting of 2.1 seconds before it resets to prevent it from hanging during the upload process. Upon reset, the values 254 and 212 will be returned to indicate an error or lengthy delay has occurred in the upload process. If everything goes smoothly, the protocol will end with the host transmitting a final confirmation byte and the font will be stored in the display ready for any application.

#### **XModem Transfer Protocol**

In addition to its original simple upload format, Matrix Orbital has added an XModem based protocol. This facilitates much faster download speeds by increasing the packet size from 1 byte to 128 bytes and using only a two byte CRC for error checking, greatly increasing throughput. To begin the upload, a series of command bytes are sent, a list of valid file type bytes is show in the File Types table. Once the command bytes are sent, the true size of the file is sent in four bytes, least significant byte first. At this point the display will respond with a C if the file fits or a NAK otherwise. Please note that these values are different than those of the original protocol as seen in the XModem Message Bytes table. If a NAK is seen at any point by the host, the upload is to be aborted in the same fashion as the regular protocol. If the file will fit, the start of header byte will be sent by the host, followed by a block count, in regular and inverted format, representing the number of 128 byte blocks remaining to be sent. The display will then check to make sure the block count value matches its own, if it doesn't it will NAK. The host can then send a 128 byte block of data followed by that blocks high and low CRC16 bytes. The display then performs a CRC check on the data receive and ACKs if it matches that which was sent. Transfer continues with a block count and continues in this way until the end of file is reached. Files may be padded with 255 values to reach an even multiple of 128 bytes in size, but the download command will always report true size. Once the end of the upload file is reached, the host should transmit a single end of transmission byte. If the end of file is expected, the display will ACK one last time.

Table 42: XModem File Upload Protocol

Table 43: XModem File Download Protocol

Host	Display	Comments	Host	Display	Comments
254		Command Prefix	254		Command Prefix
220		XModem Upload Command	221		XModem Download Command

71		*CRC LSB		71	*CRC LSB
	6	ACK (NAK if counts don't match)	6		ACK (NAK if counts don't match)
4		End of Transmission		4	End of Transmission
	6	ACK (NAK if EOT is not expected)	6		ACK (NAK if EOT is not expected)

Table 44: XModem Message Bytes

Value	Action	Description
1	Start of Header	Begin upload transfer
4	End of Transmission	End completed upload transfer
6	Acknowledged	Transfer successful, upload continues
21	Not Acknowledged	Transfer failed, upload aborted
67	С	Confirmation that file will fit

<sup>\*</sup>Note: CRC bytes are calculated using the XMODEM CRC-CCITT algorithm available at: <a href="http://www.matrixorbital.ca/appnotes/XModem/ymodem.txt">http://www.matrixorbital.ca/appnotes/XModem/ymodem.txt</a>.

### 6.15 Data Security

15.1 Set	Dec	254	Switch	v8.0
Remember	Hex	147	Switch	
	ASCII	FE 93	Switch	
		<b>■</b> Ô		

Allows changes to specific settings to be saved to the display memory. Writing to non-volatile memory can be slow and each change consumes 1 write of at least 100,000 available. The Command Summary outlines which commands are saved always, never, and when this command is on only. Remember is off by default.

Switch Byte 1 for on or 0 for off.

15.2 Set Data	Dec	254 202 245	Level	v8.0
Lock	Hex	160	Level	
	ASCII	FE CA F5 A0	Level	
		■ <sup>⊥</sup>   á		

Temporarily locks certain aspects of the display to ensure no inadvertent changes are made. The lock is released after a power cycle. A new level overrides the old, and levels can be combined. Default is 0.

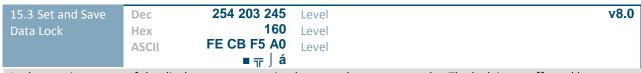

Level Byte Lock level, see Data Lock Bits table.

Table 45: Data Lock Bits

Display	Command	Filesystem	Setting	Address	Reserved	Reserved	Reserved
7	6	5	4	3	2	1	0

Table 46: Lock Parameters

Reserved	Place holders only, should be 0
Address	Locks the Baud Rate and I2C address
Setting	Locks all settings from being saved
Filesystem	Locks all bitmaps and fonts
Command	Locks all commands, text can still be written
Display	Locks entire display, no new text can be displayed

Locks certain aspects of the display to ensure no inadvertent changes are made. The lock is not affected by a power cycle. A new level overrides the old, and levels can be combined. Default is 0.

Level Byte See Data Lock Bits table.

### 6.16 Miscellaneous

16.1 Write	Dec	254 52	Data	V	8.0

XModem Filesystem Download	222, 133, 6, 48	DE, 85, 6, 30	, à, аск, 0	None	Integer, Byte[]	Never
XModem File Upload	220, 133, 6, 48	DC, 85, 6, 30	<b>■</b> , à, ACK,	Short, Byte, Integer, Byte[]	None	Always
XModem File Download	221, 133, 6, 48	DD, 85, 6, 30	, à, ACK, 0	Short, Byte	Integer, Byte[]	Never

Table 62: Data Security Command Summary

Name	Dec	Hex	ASCII	Parameters	Response	Remembered
Set Remember	147	93	ô	Byte	None	Always
Set Data Lock	202, 245, 160	CA, F5, A0	<b>ٿ</b> , ∫, á	Byte	None	Remember On
Set and Save Data Lock	203, 245, 160	CB, F5, A0	╦, ∫, á	Byte	None	Always

Table 63: Miscellaneous Command Summary

Name	Dec	Hex	ASCII	Parameters	Response	Remembered
Write Customer Data	52	34	4	Byte[16]	None	Always
Read Customer Data	53	35	5	None	Byte[16]	Never
Read Version Number	54	36	6	None	Byte	Never
Read Module Type	55	37	7	None	Byte	Never
Read Screen	184	В8	٦	None	Byte, Byte, Byte[]	Never
Write to Scratchpad	204	CC	╠	Byte, Short, Byte[]	None	Never
Read from Scratchpad	205	CD	=	Byte, Short	Byte[]	Never

## 7.1 Block Diagram

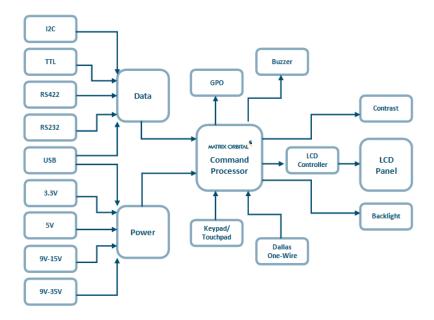

Figure 20: Functional Diagram

## 7.2 Environmental Specifications

Table 64: Environmental Limits

	Standard	*Extended (-E)
Operating Temperature	0°C to +50°C	-20°C to +70°C
Storage Temperature	-10°C to +60°C	-30°C to +80°C
<b>Operating Relative Humidity</b>	Maximum 90%	non-condensing

<sup>\*</sup>Note: The Extended Temperature option is not available for any variant of the GLT240128.

### 7.3 Electrical Tolerances

#### **Current Consumption**

Table 65: Current Consumption

Table 66: Backlight Current Draw

YG	GW & WB
265mA	80mA

#### **Input Voltage Specifications**

Table 67: Voltage Specifications

Standard	Extended Wide Voltage (-VPT)	
4.75-5.25V	9.0-35.0V	

## 7.4 Dimensional Drawings

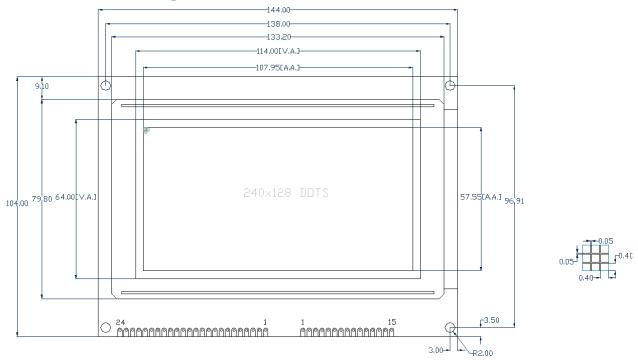

Figure 21: Display Dimensional Drawing

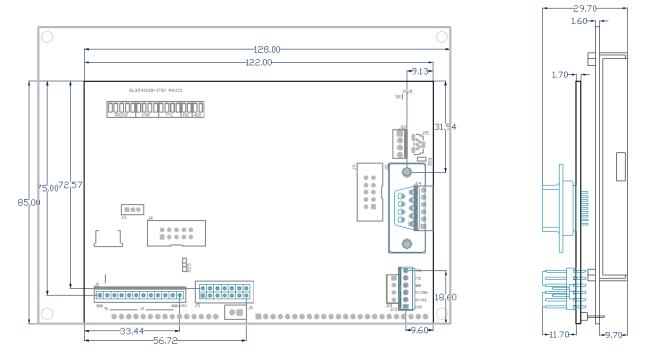

Figure 22: Standard Model Dimensional Drawing

62

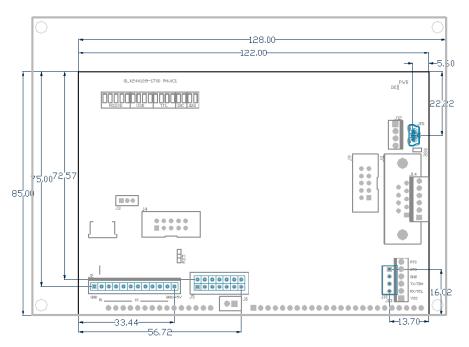

Figure 23: USB Model Dimensional Drawing

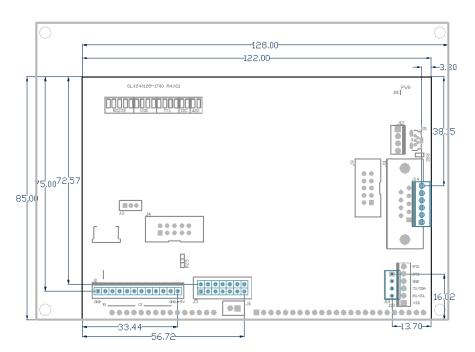

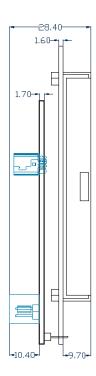

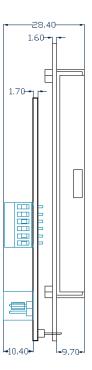

Figure 24: RS422 Model Dimensional Drawing

## 7.1 Optical Characteristics

Table 68: Display Optics

Module Size	144.00 x 104.00 x 27.8	mm
Viewing Area	114.0 x 64.0	mm
Active Area	107.95 x 57.55	mm
Pixel Size	0.40 x 0.40	mm
Pixel Pitch	0.45 x 0.45	mm
Viewing Direction	12	O'clock
Viewing Angle	-30 to +30	0
Contrast Ratio	3	
Backlight Half-Life (YG)	50,000	Hours
Backlight Half-Life (WB & GW)	20,000	Hours

<sup>\*</sup>Note: Backlight half-life is rated for normal operating conditions only: 25±10°C and 45±20% Relative Humidity.

## 8 Ordering

## 8.1 Part Numbering Scheme

Table 69: Part Numbering Scheme

GLT	-240128		-422	-WB	-VPT	-E
1	2	3	4	5	6	7

## 8.2 Options

Table 70: Display Options

#	Designator	<b>Options</b>	
1	Product Type	GLK: Graphic Liquid Crystal Display with Keypad Input GLT: Graphic Liquid Crystal Display with Touchpad Input	
2	Display Size	240128: 240 pixel columns by 128 rows	
3	Keypad Size	*NP: No keypad 25: 25 key maximum	
4	Protocol	*NP: Standard Model -USB: USB Only Model **-422: RS422 Only Model	
5	Colour	*NP: Black Text with Yellow-Green Background FGW: Black Text with Grey-White Background WB: White Text with Blue Background	
6	Voltage	*NP: Standard Voltage -VPT: Wide Voltage with Efficient Switching Power Supply	
7	Temperature	*NP: Standard  ***-E: Extended Temperature	

<sup>\*</sup>Note: NP means No Populate; skip this designator in the part number and move to the next option.

<sup>\*\*</sup>Note: The RS422 model should only be powered from a local source, unless the –VPT variant is used.

<sup>\*\*\*</sup>Note: Extended Temperature is available for keypad input units only; -E is not available for GLT models.

## 8.3 Accessories

### Power

Table 71: Power Accessories

PCS Standard Power Cable
--------------------------

#### Communication

Table 72: Communication Accessories

CSS1FT	1 ft. Serial Cable	
CSS4FT	4 ft. Serial Cable	
EXTMUSB3FT	Mini-USB Cable	
INTMUSB3FT	Internal Mini-USB Cable	
ESCCPC5V	Extended Serial Communication/5V Power Cable	
ВВС	Breadboard Cable	

## Peripherals

Table 73: Peripheral Accessories

#### 9 Definitions

ASCII: American standard code for information interchange used to give standardized numeric codes to alphanumeric characters.

BPS: Bits per second, a measure of transmission speed.

Byte: An unsigned data packet that is eight bits long.

FFSTN: Double film super-twisted nematic in reference to an LCD. The addition of two layers of film between the STN display and polarizer improves contrast.

GPO: General purpose output, used to control peripheral devices from a display.

GUI: Graphical user interface.

Hexadecimal: A base 16 number system utilizing symbols 0 through F to represent the values 0-15.

Inter-integrated circuit protocol uses clock and data lines to communicate short distances at slow speeds from a master to up to 128 addressable slave devices. A display is a slave device.

Integer: An unsigned data packet that is thirty-two bits long, in little Endian format.

LSB: Least significant bit or byte in a transmission, the rightmost when read.

MSB: Most significant bit or byte in a transmission, the leftmost when read.

RS232: Recommended standard 232, a common serial protocol. A low level is -30V, a high is +30V.

RS422: Recommended standard 422, a more robust differential pair serial protocol.

SDA: Serial data line used to transfer data in  $I^2C$  protocol. This open drain line should be pulled high through a resistor. Nominal values are between 1K and 10K  $\Omega$ .

SCL: Serial clock line used to designate data bits in  $I^2C$  protocol. This open drain line should be pulled high through a resistor. Nominal values are between 1K and 10K  $\Omega$ .

Short: An unsigned data packet that is sixteen bits long, in little Endian format.

STN: Super-twisted nematic in reference to an LCD. In a relaxed or nematic state, crystals orientate themselves in the same direction and allow light to pass. In an excited state these crystals align to block light. Super-twisted crystals move from 180 to 270 degrees providing greater contrast than TN models.

TTL: Transistor-transistor logic applied to serial protocol. Low level is 0V while high logic is 5V.
