

## 1 Mbit SPI Bus Serial EEPROM

### Device Selection Table

Part Number	Vcc Range	Page Size	Temp. Ranges	Packages
25AA1024	1.8-5.5V	256 Byte	I	P, SM, MF

### Features:

- 20 MHz max. Clock Speed
- Byte and Page-level Write Operations:
  - 256 byte page
  - 6 ms max. write cycle time
  - No page or sector erase required
- Low-Power CMOS Technology:
  - Max. Write current: 5 mA at 5.5V, 20 MHz
  - Read current: 7 mA at 5.5V, 20 MHz
  - Standby current: 1µA at 2.5V (Deep power-down)
- Electronic Signature for Device ID
- Self-Timed Erase and Write Cycles:
  - Page Erase (6 ms max.)
  - Sector Erase (10 ms max.)
  - Chip Erase (10 ms max.)
- Sector Write Protection (32K byte/sector):
  - Protect none, 1/4, 1/2 or all of array
- Built-In Write Protection:
  - Power-on/off data protection circuitry
  - Write enable latch
  - Write-protect pin
- High Reliability:
  - Endurance: 1M erase/write cycles
  - Data Retention: >200 years
  - ESD Protection: 4000V
- Temperature Ranges Supported:
  - Industrial (I): -40°C to +85°C
- Pb-Free and RoHS Compliant

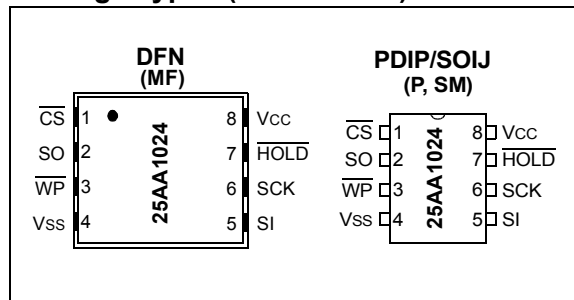

### Description:

The Microchip Technology Inc. 25AA1024 is a 1024 Kbit serial EEPROM memory with byte-level and page-level serial EEPROM functions. It also features Page, Sector and Chip erase functions typically associated with Flash-based products. These functions are not required for byte or page write operations. The memory is accessed via a simple Serial Peripheral Interface (SPI) compatible serial bus. The bus signals required are a clock input (SCK) plus separate data in (SI) and data out (SO) lines. Access to the device is controlled by a Chip Select (CS) input.

Communication to the device can be paused via the hold pin ( $\overline{\text{HOLD}}$ ). While the device is paused, transitions on its inputs will be ignored, with the exception of Chip Select, allowing the host to service higher priority interrupts.

The 25AA1024 is available in standard packages including 8-lead PDIP and SOIJ, and advanced 8-lead DFN package. All devices are Pb-free.

### Package Types (not to scale)

### Pin Function Table

Name	Function
$\overline{\text{CS}}$	Chip Select Input
SO	Serial Data Output
$\overline{\text{WP}}$	Write-Protect
Vss	Ground
SI	Serial Data Input
SCK	Serial Clock Input
$\overline{\text{HOLD}}$	Hold Input
Vcc	Supply Voltage

# 25AA1024

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings (†)

V <sub>CC</sub> .....	6.5V
All inputs and outputs w.r.t. V <sub>SS</sub> .....	-0.6V to V <sub>CC</sub> +1.0V
Storage temperature .....	-65°C to 150°C
Ambient temperature under bias.....	-40°C to 125°C
ESD protection on all pins.....	4 kV

† NOTICE: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for an extended period of time may affect device reliability.

**TABLE 1-1: DC CHARACTERISTICS**

DC CHARACTERISTICS			Industrial (I)*: TA = 0°C to +85°C		V <sub>CC</sub> = 1.8V to 5.5V	
			Industrial (I): TA = -40°C to +85°C		V <sub>CC</sub> = 2.0V to 5.5V	
			* Limited industrial temp range.

## Read Sequence

The device is selected by pulling  $\overline{CS}$  low. The 8-bit `READ` instruction is transmitted to the 25AA1024 followed by the 24-bit address, with seven MSBs of the address being “don't care” bits. After the correct `READ` instruction and address are sent, the data stored in the memory at the selected address is shifted out on the `SO` pin.

The data stored in the memory at the next address can be read sequentially by continuing to provide clock pulses. The internal Address Pointer is automatically incremented to the next higher address after each byte of data is shifted out. When the highest address is reached (1FFFFh), the address counter rolls over to address, 00000h, allowing the read cycle to be continued indefinitely. The read operation is terminated by raising the  $\overline{CS}$  pin (Figure 2-1).

**FIGURE 2-1: READ SEQUENCE**

## 2.2 Write Sequence

Prior to any attempt to write data to the 25AA1024, the write enable latch must be set by issuing the  $\overline{WREN}$  instruction (Figure 2-4). This is done by setting  $\overline{CS}$  low and then clocking out the proper instruction into the 25AA1024. After all eight bits of the instruction are transmitted, the  $\overline{CS}$  must be brought high to set the write enable latch. If the write operation is initiated immediately after the  $\overline{WREN}$  instruction without  $\overline{CS}$  being brought high, the data will not be written to the array because the write enable latch will not have been properly set.

A write sequence includes an automatic, self timed erase cycle. It is not required to erase any portion of the memory prior to issuing a Write command.

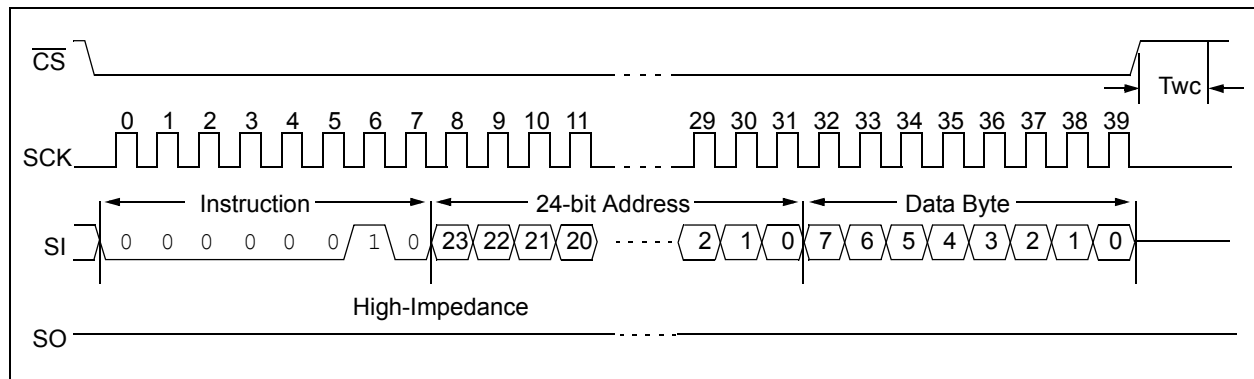

Once the write enable latch is set, the user may proceed by setting the  $\overline{CS}$  low, issuing a  $\overline{WRITE}$  instruction, followed by the 24-bit address, with seven MSBs of the address being “don’t care” bits, and then the data to be written. Up to 256 bytes of data can be sent to the device before a write cycle is necessary. The only restriction is that all of the bytes must reside in the same page.

**Note:** When doing a write of less than 256 bytes the data in the rest of the page is refreshed along with the data bytes being written. This will force the entire page to endure a write cycle, for this reason endurance is specified per page.

**Note:** Page write operations are limited to writing bytes within a single physical page, **regardless** of the number of bytes actually being written. Physical page boundaries start at addresses that are integer multiples of the page buffer size (or ‘page size’), and end at addresses that are integer multiples of page size – 1. If a Page Write command attempts to write across a physical page boundary, the result is that the data wraps around to the beginning of the current page (overwriting data previously stored there), instead of being written to the next page as might be expected. It is therefore necessary for the application software to prevent page write operations that would attempt to cross a page boundary.

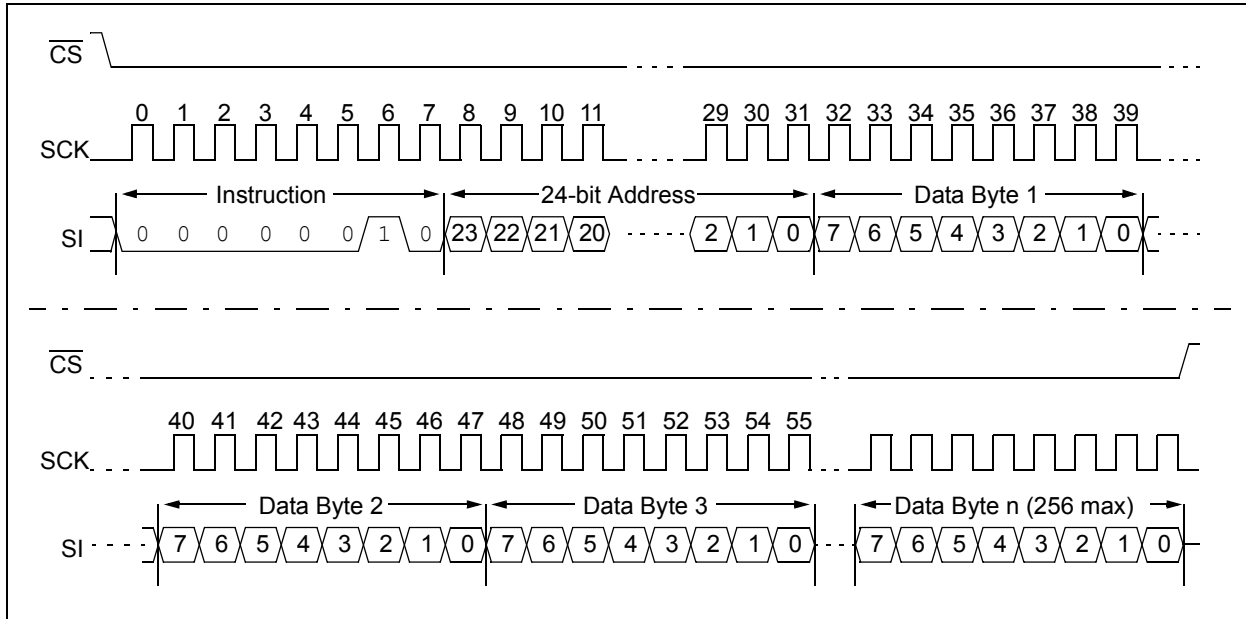

For the data to be actually written to the array, the  $\overline{CS}$  must be brought high after the Least Significant bit (D0) of the  $n^{th}$  data byte has been clocked in. If  $\overline{CS}$  is brought high at any other time, the write operation will not be completed. Refer to Figure 2-2 and Figure 2-3 for more detailed illustrations on the byte write sequence and the page write sequence, respectively. While the write is in progress, the STATUS register may be read to check the status of the WPEN, WIP, WEL, BP1 and BP0 bits (Figure 2-6). A read attempt of a memory array location will not be possible during a write cycle. When the write cycle is completed, the write enable latch is reset.

**FIGURE 2-2: BYTE WRITE SEQUENCE**

# 25AA1024

FIGURE 2-3: PAGE WRITE SEQUENCE

## 2.3 Write Enable (WREN) and Write Disable (WRDI)

The 25AA1024 contains a write enable latch. See Table 2-4 for the Write-Protect Functionality Matrix. This latch must be set before any write operation will be completed internally. The WREN instruction will set the latch, and the WRDI will reset the latch.

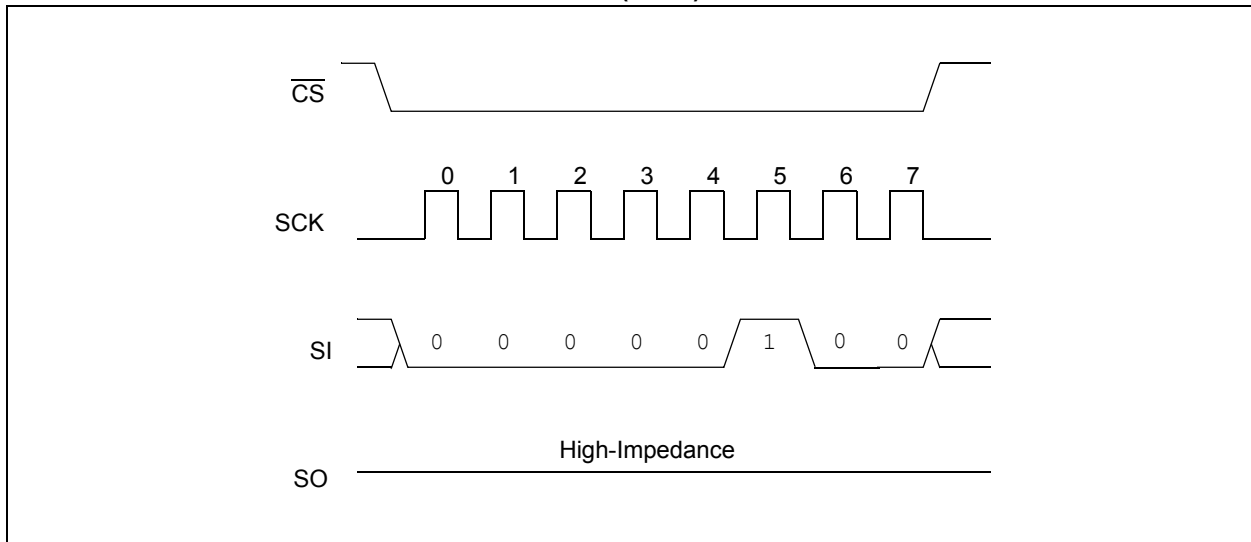

The following is a list of conditions under which the write enable latch will be reset:

- Power-up
- WRDI instruction successfully executed
- WRSR instruction successfully executed
- WRITE instruction successfully executed
- PE instruction successfully executed
- SE instruction successfully executed
- CE instruction successfully executed

**FIGURE 2-4: WRITE ENABLE SEQUENCE (WREN)**

**FIGURE 2-5: WRITE DISABLE SEQUENCE (WRDI)**

# 25AA1024

## 2.4 Read Status Register Instruction (RDSR)

The Read Status Register instruction (RDSR) provides access to the STATUS register. The STATUS register may be read at any time, even during a write cycle. The STATUS register is formatted as follows:

**TABLE 2-2: STATUS REGISTER**

7	6	5	4	3	2	1	0
W/R	-	-	-	W/R	W/R	R	R
WPEN	X	X	X	BP1	BP0	WEL	WIP
W/R = writable/readable. R = read-only.							

The **Write-In-Process (WIP)** bit indicates whether the 25AA1024 is busy with a write operation. When set to a '1', a write is in progress, when set to a '0', no write is in progress. This bit is read-only.

The **Write Enable Latch (WEL)** bit indicates the status of the write enable latch and is read-only. When set to a '1', the latch allows writes to the array, when set to a '0', the latch prohibits writes to the array. The state of this bit can always be updated via the WREN or WRDI commands regardless of the state of write protection on the STATUS register. These commands are shown in Figure 2-4 and Figure 2-5.

The **Block Protection (BP0 and BP1)** bits indicate which blocks are currently write-protected. These bits are set by the user issuing the WRSR instruction. These bits are nonvolatile and are shown in Table 2-3.

See Figure 2-6 for the RDSR timing sequence.

**FIGURE 2-6: READ STATUS REGISTER TIMING SEQUENCE (RDSR)**

## 2.5 Write Status Register Instruction (WRSR)

The Write Status Register instruction (WRSR) allows the user to write to the nonvolatile bits in the STATUS register as shown in Table 2-2. The user is able to select one of four levels of protection for the array by writing to the appropriate bits in the STATUS register. The array is divided up into four segments. The user has the ability to write-protect none, one, two, or all four of the segments of the array. The partitioning is controlled as shown in Table 2-3.

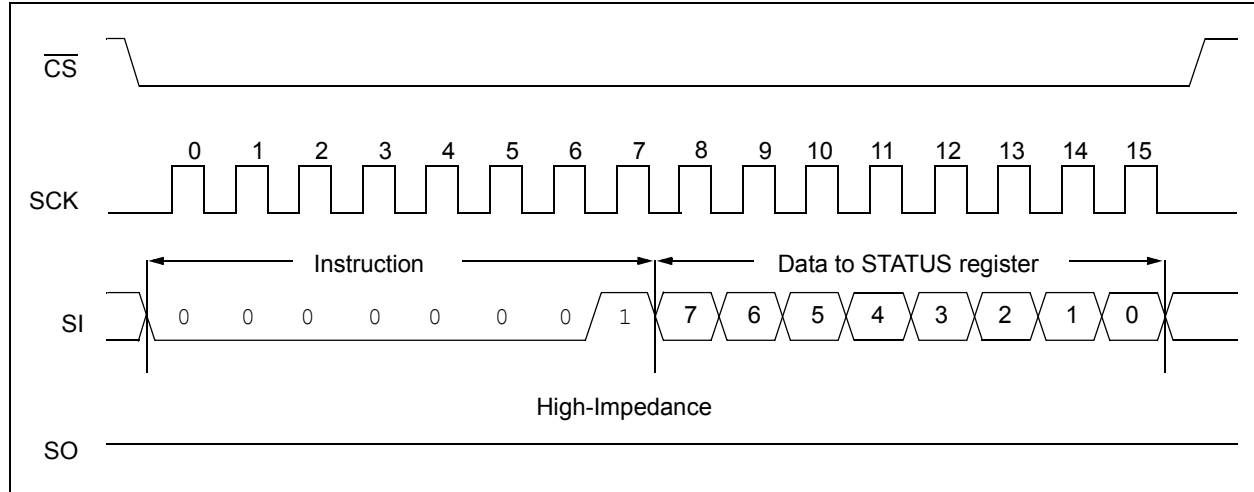

The Write-Protect Enable (WPEN) bit is a nonvolatile bit that is available as an enable bit for the  $\overline{WP}$  pin. The Write-Protect ( $\overline{WP}$ ) pin and the Write-Protect Enable (WPEN) bit in the STATUS register control the programmable hardware write-protect feature. Hardware write protection is enabled when  $\overline{WP}$  pin is low and the WPEN bit is high. Hardware write protection is disabled when either the  $\overline{WP}$  pin is high or the WPEN bit is low. When the chip is hardware write-protected, only writes to nonvolatile bits in the STATUS register are disabled. See Table 2-4 for a matrix of functionality on the WPEN bit.

See Figure 2-7 for the WRSR timing sequence.

**TABLE 2-3: ARRAY PROTECTION**

BP1	BP0	Array Addresses Write-Protected	Array Addresses Unprotected
0	0	none	All (Sectors 0, 1, 2 & 3) (00000h-1FFFFh)
0	1	Upper 1/4 (Sector 3) (18000h-1FFFFh)	Lower 3/4 (Sectors 0, 1 & 2) (00000h-17FFFh)
1	0	Upper 1/2 (Sectors 2 & 3) (10000h-1FFFFh)	Lower 1/2 (Sectors 0 & 1) (00000h-0FFFFh)
1	1	All (Sectors 0, 1, 2 & 3) (00000h-1FFFFh)	none

**FIGURE 2-7: WRITE STATUS REGISTER TIMING SEQUENCE (WRSR)**

# 25AA1024

## 2.6 Data Protection

The following protection has been implemented to prevent inadvertent writes to the array:

- The write enable latch is reset on power-up
- A write enable instruction must be issued to set the write enable latch
- After a byte write, page write or STATUS register write, the write enable latch is reset
- $\overline{CS}$  must be set high after the proper number of clock cycles to start an internal write cycle
- Access to the array during an internal write cycle is ignored and programming is continued

## 2.7 Power-On State

The 25AA1024 powers on in the following state:

- The device is in low-power Standby mode ( $\overline{CS} = 1$ )
- The write enable latch is reset
- SO is in high-impedance state
- A high-to-low-level transition on  $\overline{CS}$  is required to enter active state

**TABLE 2-4: WRITE-PROTECT FUNCTIONALITY MATRIX**

WEL (SR bit 1)	WPEN (SR bit 7)	$\overline{WP}$ (pin 3)	Protected Blocks	Unprotected Blocks	STATUS Register
0	x	x	Protected	Protected	Protected
1	0	x	Protected	Writable	Writable
1	1	0 (low)	Protected	Writable	Protected
1	1	1 (high)	Protected	Writable	Writable

x = don't care

## 2.8 PAGE ERASE

The Page Erase function will erase all bits (FFh) inside the given page. A Write Enable ( $\overline{WREN}$ ) instruction must be given prior to attempting a Page Erase. This is done by setting  $\overline{CS}$  low and then clocking out the proper instruction into the 25AA1024. After all eight bits of the instruction are transmitted, the  $\overline{CS}$  must be brought high to set the write enable latch.

The Page Erase function is entered by driving  $\overline{CS}$  low, followed by the instruction code (Figure 2-8), and three address bytes. Any address inside the page to be erased is a valid address.

$\overline{CS}$  must then be driven high after the last bit if the address or the Page Erase will not execute. Once the  $\overline{CS}$  is driven high, the self-timed Page Erase cycle is started. The WIP bit in the STATUS register can be read to determine when the Page Erase cycle is complete.

If a Page Erase function is given to an address that has been protected by the Block Protect bits (BP0, BP1) then the sequence will be aborted and no erase will occur.

**FIGURE 2-8: PAGE ERASE SEQUENCE**

# 25AA1024

## 2.9 SECTOR ERASE

The Sector Erase function will erase all bits (FFh) inside the given sector. A Write Enable ( $\overline{WREN}$ ) instruction must be given prior to attempting a Sector Erase. This is done by setting  $\overline{CS}$  low and then clocking out the proper instruction into the 25AA1024. After all eight bits of the instruction are transmitted, the  $\overline{CS}$  must be brought high to set the write enable latch.

The Sector Erase function is entered by driving  $\overline{CS}$  low, followed by the instruction code (Figure 2-9), and three address bytes. Any address inside the sector to be erased is a valid address.

$\overline{CS}$  must then be driven high after the last bit if the address or the Sector Erase will not execute. Once the  $\overline{CS}$  is driven high, the self-timed Sector Erase cycle is started. The WIP bit in the STATUS register can be read to determine when the Sector Erase cycle is complete.

If a `SECTOR ERASE` instruction is given to an address that has been protected by the Block Protect bits (BP0, BP1) then the sequence will be aborted and no erase will occur.

See Table 2-3 for Sector Addressing.

**FIGURE 2-9: SECTOR ERASE SEQUENCE**

## 2.10 CHIP ERASE

The Chip Erase function will erase all bits (FFh) in the array. A Write Enable ( $\overline{WREN}$ ) instruction must be given prior to executing a Chip Erase. This is done by setting  $\overline{CS}$  low and then clocking out the proper instruction into the 25AA1024. After all eight bits of the instruction are transmitted, the  $\overline{CS}$  must be brought high to set the write enable latch.

The Chip Erase function is entered by driving the  $\overline{CS}$  low, followed by the instruction code (Figure 2-10) onto the SI line.

The  $\overline{CS}$  pin must be driven high after the eighth bit of the instruction code has been given or the Chip Erase function will not be executed. Once the  $\overline{CS}$  pin is driven high, the self-timed Chip Erase function begins. While the device is executing the Chip Erase function the WIP bit in the STATUS register can be read to determine when the Chip Erase function is complete.

The Chip Erase function is ignored if either of the Block Protect bits (BP0, BP1) are not 0, meaning  $\frac{1}{4}$ ,  $\frac{1}{2}$ , or all of the array is protected.

**FIGURE 2-10: CHIP ERASE SEQUENCE**

# 25AA1024

## 2.11 DEEP POWER-DOWN MODE

Deep Power-Down mode of the 25AA1024 is its lowest power consumption state. The device will not respond to any of the Read or Write commands while in Deep Power-Down mode, and therefore it can be used as an additional software write protection feature.

The Deep Power-Down mode is entered by driving  $\overline{CS}$  low, followed by the instruction code (Figure 2-11) onto the SI line, followed by driving  $\overline{CS}$  high.

If the  $\overline{CS}$  pin is not driven high after the eighth bit of the instruction code has been given, the device will not execute Deep power-down. Once the  $\overline{CS}$  line is driven high, there is a delay ( $T_{DP}$ ) before the current settles to its lowest consumption.

All instructions given during Deep Power-Down mode are ignored except the Read Electronic Signature Command (RDID). The RDID command will release the device from Deep power-down and outputs the electronic signature on the SO pin, and then returns the device to Standby mode after delay ( $T_{REL}$ )

Deep Power-Down mode automatically releases at device power-down. Once power is restored to the device, it will power-up in the Standby mode.

FIGURE 2-11: DEEP POWER-DOWN SEQUENCE

## 2.12 RELEASE FROM DEEP POWER-DOWN AND READ ELECTRONIC SIGNATURE

Once the device has entered Deep Power-Down mode all instructions are ignored except the release from Deep Power-down and Read Electronic Signature command. This command can also be used when the device is not in Deep Power-down, to read the electronic signature out on the SO pin unless another command is being executed such as Erase, Program or Write STATUS register.

Release from Deep Power-Down mode and Read Electronic Signature is entered by driving  $\overline{CS}$  low, followed by the RDID instruction code (Figure 2-12) and then a dummy address of 24 bits (A23-A0). After the last bit of the dummy address is clocked in, the 8-bit Electronic signature is clocked out on the SO pin.

After the signature has been read out at least once, the sequence can be terminated by driving  $\overline{CS}$  high. The device will then return to Standby mode and will wait to be selected so it can be given new instructions. If additional clock cycles are sent after the electronic signature has been read once, it will continue to output the signature on the SO line until the sequence is terminated.

**FIGURE 2-12: RELEASE FROM DEEP POWER-DOWN AND READ ELECTRONIC SIGNATURE**

Driving  $\overline{CS}$  high after the 8-bit RDID command, but before the Electronic Signature has been transmitted, will still ensure the device will be taken out of Deep Power-Down mode. However, there is a delay  $T_{REL}$  that occurs before the device returns to Standby mode ( $I_{CCS}$ ), as shown in Figure 2-13.

**FIGURE 2-13: RELEASE FROM DEEP POWER-DOWN AND READ ELECTRONIC SIGNATURE**

# 25AA1024

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

**TABLE 3-1: PIN FUNCTION TABLE**

Name	Pin Number	Function
$\overline{\text{CS}}$	1	Chip Select Input
SO	2	Serial Data Output
$\overline{\text{WP}}$	3	Write-Protect Pin
Vss	4	Ground
SI	5	Serial Data Input
SCK	6	Serial Clock Input
$\overline{\text{HOLD}}$	7	Hold Input
Vcc	8	Supply Voltage

### 3.1 Chip Select ( $\overline{\text{CS}}$ )

A low level on this pin selects the device. A high level deselects the device and forces it into Standby mode. However, a programming cycle which is already initiated or in progress will be completed, regardless of the  $\overline{\text{CS}}$  input signal. If  $\overline{\text{CS}}$  is brought high during a program cycle, the device will go into Standby mode as soon as the programming cycle is complete. When the device is deselected, SO goes to the high-impedance state, allowing multiple parts to share the same SPI bus. A low-to-high transition on  $\overline{\text{CS}}$  after a valid write sequence initiates an internal write cycle. After power-up, a low level on  $\overline{\text{CS}}$  is required prior to any sequence being initiated.

### 3.2 Serial Output (SO)

The SO pin is used to transfer data out of the 25AA1024. During a read cycle, data is shifted out on this pin after the falling edge of the serial clock.

### 3.3 Write-Protect ( $\overline{\text{WP}}$ )

This pin is used in conjunction with the WPEN bit in the STATUS register to prohibit writes to the nonvolatile bits in the STATUS register. When  $\overline{\text{WP}}$  is low and WPEN is high, writing to the nonvolatile bits in the STATUS register is disabled. All other operations function normally. When  $\overline{\text{WP}}$  is high, all functions, including writes to the nonvolatile bits in the STATUS register, operate normally. If the WPEN bit is set,  $\overline{\text{WP}}$  low during a STATUS register write sequence will disable writing to the STATUS register. If an internal write cycle has already begun,  $\overline{\text{WP}}$  going low will have no effect on the write.

The  $\overline{\text{WP}}$  pin function is blocked when the WPEN bit in the STATUS register is low. This allows the user to install the 25AA1024 in a system with  $\overline{\text{WP}}$  pin grounded and still be able to write to the STATUS register. The WP pin functions will be enabled when the WPEN bit is set high.

### 3.4 Serial Input (SI)

The SI pin is used to transfer data into the device. It receives instructions, addresses and data. Data is latched on the rising edge of the serial clock.

### 3.5 Serial Clock (SCK)

The SCK is used to synchronize the communication between a master and the 25AA1024. Instructions, addresses or data present on the SI pin are latched on the rising edge of the clock input, while data on the SO pin is updated after the falling edge of the clock input.

### 3.6 Hold ( $\overline{\text{HOLD}}$ )

The  $\overline{\text{HOLD}}$  pin is used to suspend transmission to the 25AA1024 while in the middle of a serial sequence without having to retransmit the entire sequence again. It must be held high any time this function is not being used. Once the device is selected and a serial sequence is underway, the  $\overline{\text{HOLD}}$  pin may be pulled low to pause further serial communication without resetting the serial sequence. The HOLD pin must be brought low while SCK is low, otherwise the HOLD function will not be invoked until the next SCK high-to-low transition. The 25AA1024 must remain selected during this sequence. The SI, SCK and SO pins are in a high-impedance state during the time the device is paused and transitions on these pins will be ignored. To resume serial communication, HOLD must be brought high while the SCK pin is low, otherwise serial communication will not resume. Pulling the  $\overline{\text{HOLD}}$  line low at any time will tri-state the SO line.

## 4.0 PACKAGING INFORMATION

### 4.1 Package Marking Information

8-Lead DFN

Example:

8-Lead PDIP

Example:

8-Lead SOIJ

Example:

<b>Legend:</b>	XX...X	Part number or part number code
	T	Temperature (I)
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code (2 characters for small packages)
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)

**Note:** For very small packages with no room for the Pb-free JEDEC designator (e3), the marking will only appear on the outer carton or reel label.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

# 25AA1024

## 8-Lead Plastic Dual Flat, No Lead Package (MF) – 6x5 mm Body [DFN-S] PUNCH SINGULATED

**Note:** For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>

Dimension Limits	Units	MILLIMETERS		
		MIN	NOM	MAX
Number of Pins	N	8		
Pitch	e	1.27 BSC		
Overall Height	A	–	0.85	1.00
Molded Package Thickness	A2	–	0.65	0.80

## APPENDIX A:

### REVISION HISTORY

#### Revision C (02/2007)

Revised Features Section (Self-timed Erase and Write Cycles); Revised Table 1-1 (Param. D012 and D13); Table 1-2 (Param. 20-24); Revised Package Marking Information; Replaced Package Drawings; Revised Product ID System Section (SM package). Changed PICmicro to PIC.

#### Revision D (07/2007)

Revised Features; Revised Tables 1-1 and 1-2 (added Industrial temp. and revised parameters 22-23); Replaced Package Drawings (Rev. AP); Revised Product ID System; Changed Flash to EEPROM.

#### Revision E (10/2007)

Removed 25LC1024 part number; New data sheet created for 25LC1024 (DS22064); Revised Tables; Updates throughout.

#### Revision F (5/2008)

Modified parameter D006 in Table 1-1; Revised Package Marking Information; Replaced Package Drawings.

#### Revision G (01/2010)

Added 8-Lead (MF) DFN-S Land Pattern; Replaced 8-Lead (SM) SOIJ Land Pattern.

#### Revision H (05/10)

Revised Table 1-2, Param. No 25 Conditions; Revised Section 2.2, added note.

# 25AA1024

NOTES:

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com), click on Customer Change Notification and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: <http://support.microchip.com>**

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To: Technical Publications Manager  
RE: Reader Response  
Total Pages Sent \_\_\_\_\_

From: Name \_\_\_\_\_  
Company \_\_\_\_\_  
Address \_\_\_\_\_  
City / State / ZIP / Country \_\_\_\_\_

Questions:

1. What are the best features of this document?

---

---

2. How does this document meet your hardware and software development needs?

---

---

3. Do you find the organization of this document easy to follow? If not, why?

---

---

4. What additions to the document do you think would enhance the structure and subject?

---

---

5. What deletions from the document could be made without affecting the overall usefulness?

---

---

6. Is there any incorrect or misleading information (what and where)?

---

---

7. How would you improve this document?

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
