

## High-side driver with MultiSense analog feedback for automotive application

Datasheet - production data

- Loss of ground and loss of  $V_{CC}$
- Configurable latch-off on overtemperature or power limitation with dedicated fault reset pin
- Reverse battery with external components
- Electrostatic discharge protection

### Features

Max transient supply voltage	$V_{CC}$	40 V
Operating voltage range	$V_{CC}$	4 to 28 V
Typ. on-state resistance	$R_{ON}$	20 m $\Omega$
Current limitation (typ)	$I_{LIMH}$	63 A
Stand-by current (max)	$I_{STBY}$	0.5 $\mu$ A

- General
  - Automotive qualified
  - Single channel smart high-side driver with MultiSense analog feedback
  - Very low standby current
  - Compatible with 3 V and 5 V CMOS outputs
- MultiSense diagnostic functions
  - Multiplexed analog feedback of: load current with high precision proportional current mirror,  $V_{CC}$  supply voltage and  $T_{CHIP}$  device temperature
  - Overload and short to ground (power limitation) indication
  - Thermal shutdown indication
  - OFF-state open-load detection
  - Output short to  $V_{CC}$  detection
  - Sense enable/disable
- Protections
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation
  - Self limiting of fast thermal transients

### Applications

- All types of automotive resistive, inductive and capacitive loads
- Specially intended for Automotive Turn Indicators (up to 2 x P27W or SAE1156 and R5W paralleled or LED Rear Combinations)

### Description

The VN7020AJ-E is a single channel high-side driver manufactured using ST proprietary VIPower<sup>®</sup> technology and housed in PowerSSO-16 package. The device is designed to drive 12 V automotive grounded loads through a 3 V and 5 V CMOS-compatible interface, and to provide protection and diagnostics.

The device integrates advanced protective functions such as load current limitation, overload active management by power limitation and overtemperature shutdown with configurable latch-off. A  $\overline{\text{FaultRST}}$  pin unlatches the output in case of fault or disables the latch-off functionality.

A dedicated multifunction multiplexed analog output pin delivers sophisticated diagnostic functions including high precision proportional load current sense, supply voltage feedback and chip temperature sense, in addition to the detection of overload and short circuit to ground, short to  $V_{CC}$  and OFF-state open-load.

A sense enable pin allows OFF-state diagnosis to be disabled during the module low-power mode as well as external sense resistor sharing among similar devices.

# 1 Block diagram and pin description

Figure 1. Block diagram

Table 1. Pin functions

Name	Function
V <sub>CC</sub>	Battery connection.
OUTPUT	Power output.
GND	Ground connection. Must be reverse battery protected by an external diode / resistor network.
INPUT	Voltage controlled input pin with hysteresis, CMOS compatible. It controls output switch state.
MultiSense	Multiplexed analog sense output pin; it delivers a current proportional to the selected diagnostic: load current, supply voltage or chip temperature.
SEn	Active high compatible with 3 V and 5 V CMOS output pin; it enables the MultiSense diagnostic pin.
SEL <sub>0,1</sub>	Active high compatible with 3 V and 5 V CMOS output pin; they address the MultiSense multiplexer.
$\overline{\text{FaultRST}}$	Active low compatible with 3 V and 5 V CMOS output pin; it unlatches the output in case of fault; If kept low, sets the outputs in auto-restart mode.

Figure 2. Configuration diagram (top view)

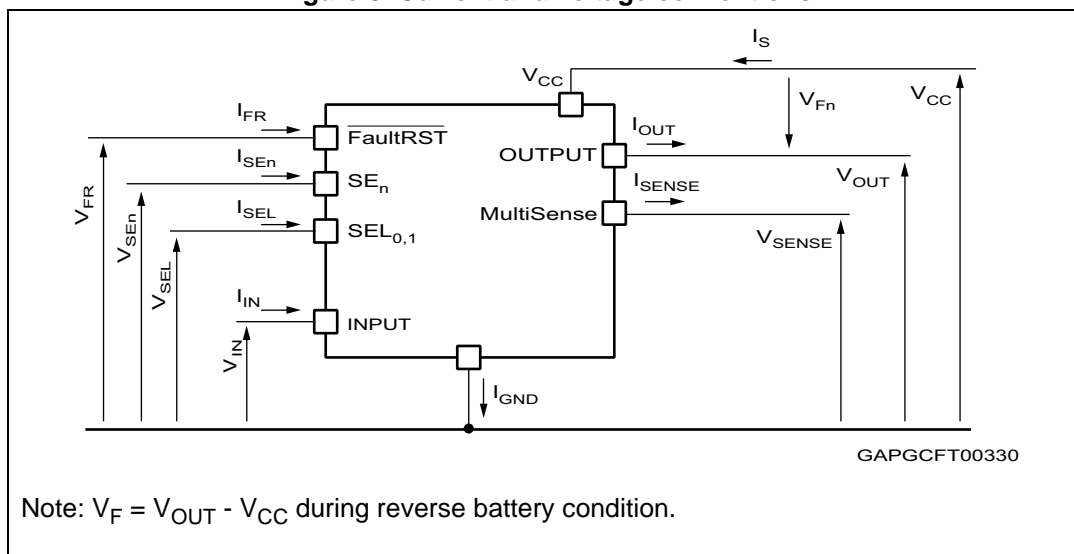

Table 2. Suggested connections for unused and not connected pins

Connection / pin	MultiSense	N.C.	Output	Input	SEn, SELx, FaultRST
Floating	Not allowed	X <sup>(1)</sup>	X	X	X
To ground	Through 1 kΩ resistor	X	Not allowed	Through 15 kΩ resistor	Through 15 kΩ resistor

1. X: do not care.

## 2 Electrical specification

Figure 3. Current and voltage conventions

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in [Table 3](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in table below for extended periods may affect device reliability.

Table 3. Absolute maximum ratings

Symbol	Parameter	Value	Unit
$V_{CC}$	DC supply voltage	38	V
$-V_{CC}$	Reverse DC supply voltage	0.3	
$V_{CCPK}$	Maximum transient supply voltage (ISO 16750-2:2010 Test B clamped to 40V; $R_L = 4 \Omega$ )	40	
$V_{CCJS}$	Maximum jump start voltage for single pulse short circuit protection	28	
$-I_{GND}$	DC reverse ground pin current	200	mA
$I_{OUT}$	OUTPUT DC output current	Internally limited	A
$-I_{OUT}$	Reverse DC output current	17	
$I_{IN}$	INPUT DC input current	-1 to 10	mA
$I_{SEn}$	SEn DC input current		
$I_{SEL}$	SEL <sub>0,1</sub> DC input current		
$I_{FR}$	FaultRST DC input current		
$V_{FR}$	FaultRST DC input voltage	7.5	V

Table 3. Absolute maximum ratings (continued)

Symbol	Parameter	Value	Unit
I <sub>SENSE</sub>	MultiSense pin DC output current ( $V_{GND} = V_{CC}$ and $V_{SENSE} < 0$ V)	10	mA
	MultiSense pin DC output current in reverse ( $V_{CC} < 0$ V)	-20	
E <sub>MAX</sub>	Maximum switching energy (single pulse) ( $T_{DEMAG} = 0.4$ ms; $T_{jstart} = 150^{\circ}\text{C}$ )	64	mJ
V <sub>ESD</sub>	Electrostatic discharge (JEDEC 22A-114F)		
	– INPUT	4000	V
	– MultiSense	2000	V
	– SEn, SEL <sub>0,1</sub> , FaultRST	4000	V
	– OUTPUT	4000	V
	– V <sub>CC</sub>	4000	V
V <sub>ESD</sub>	Charge device model (CDM-AEC-Q100-011)	750	V
T <sub>j</sub>	Junction operating temperature	-40 to 150	°C
T <sub>stg</sub>	Storage temperature	-55 to 150	

## 2.2 Thermal data

Table 4. Thermal data

Symbol	Parameter	Typ. value	Unit
R <sub>thj-board</sub>	Thermal resistance junction-board (JEDEC JESD 51-5 / 51-8) <sup>(1)</sup>	5.2	°C/W
R <sub>thj-amb</sub>	Thermal resistance junction-ambient (JEDEC JESD 51-5) <sup>(2)</sup>	57	
R <sub>thj-amb</sub>	Thermal resistance junction-ambient (JEDEC JESD 51-7) <sup>(1)</sup>	23	

1. Device mounted on four-layers 2s2p PCB.

2. Device mounted on two-layers 2s0p PCB with 2 cm<sup>2</sup> heatsink copper trace.

## 2.3 Main electrical characteristics

$7\text{ V} < V_{CC} < 28\text{ V}$ ;  $-40^\circ\text{C} < T_j < 150^\circ\text{C}$ , unless otherwise specified.

All typical values refer to  $V_{CC} = 13\text{ V}$ ;  $T_j = 25^\circ\text{C}$ , unless otherwise specified.

**Table 5. Power section**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$V_{CC}$	Operating supply voltage		4	13	28	V
$V_{USD}$	Undervoltage shutdown				4	
$V_{USDReset}$	Undervoltage shutdown reset				5	
$V_{USDhyst}$	Undervoltage shutdown hysteresis			0.3		
$R_{ON}$	On-state resistance	$I_{OUT} = 3\text{ A}$ ; $T_j = 25^\circ\text{C}$		20		m $\Omega$
		$I_{OUT} = 3\text{ A}$ ; $T_j = 150^\circ\text{C}$			40	
		$I_{OUT} = 3\text{ A}$ ; $V_{CC} = 4\text{ V}$ ; $T_j = 25^\circ\text{C}$			30	
$V_{clamp}$	Clamp voltage	$I_S = 20\text{ mA}$ ; $25^\circ\text{C} < T_j < 150^\circ\text{C}$	41	46	52	V
		$I_S = 20\text{ mA}$ ; $T_j = -40^\circ\text{C}$	38			V
$I_{STBY}$	Supply current in standby at $V_{CC} = 13\text{ V}$ (1)	$V_{CC} = 13\text{ V}$ ; $V_{IN} = V_{OUT} = V_{SEn} = 0\text{ V}$ ; $V_{FR} = V_{SELO,1} = 0\text{ V}$ ; $T_j = 25^\circ\text{C}$			0.5	$\mu\text{A}$
		$V_{CC} = 13\text{ V}$ ; $V_{IN} = V_{OUT} = V_{SEn} = 0\text{ V}$ ; $V_{FR} = V_{SELO,1} = 0\text{ V}$ ; $T_j = 85^\circ\text{C}$ (2)			0.5	
		$V_{CC} = 13\text{ V}$ ; $V_{IN} = V_{OUT} = V_{SEn} = 0\text{ V}$ ; $V_{FR} = V_{SELO,1} = 0\text{ V}$ ; $T_j = 125^\circ\text{C}$			3	
$t_{D\_STBY}$	Standby mode blanking time	$V_{CC} = 13\text{ V}$ ; $V_{IN} = V_{OUT} = V_{FR} = V_{SELO,1} = 0\text{ V}$ ; $V_{SEn} = 5\text{ V}$ to $0\text{ V}$	60	300	550	$\mu\text{s}$
$I_{S(ON)}$	Supply current	$V_{CC} = 13\text{ V}$ ; $V_{SEn} = 0\text{ V}$ ; $V_{SELO,1} = V_{FR} = 0\text{ V}$ ; $V_{IN} = 5\text{ V}$ ; $I_{OUT} = 0\text{ A}$		3	5	mA
$I_{GND(ON)}$	Control stage current consumption in ON-state. All channels active.	$V_{CC} = 13\text{ V}$ ; $V_{SEn} = 5\text{ V}$ ; $V_{SELO,1} = V_{FR} = 0\text{ V}$ ; $V_{IN} = 5\text{ V}$ ; $I_{OUT} = 3\text{ A}$			6	mA
$I_{L(off)}$	Off-state output current at $V_{CC} = 13\text{ V}$	$V_{IN} = V_{OUT} = 0\text{ V}$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 25^\circ\text{C}$	0	0.01	0.5	$\mu\text{A}$
		$V_{IN} = V_{OUT} = 0\text{ V}$ ; $V_{CC} = 13\text{ V}$ ; $T_j = 125^\circ\text{C}$	0		3	
$V_F$	Output - $V_{CC}$ diode voltage	$I_{OUT} = -3\text{ A}$ ; $T_j = 150^\circ\text{C}$			0.7	V

1. PowerMOS leakage included.

2. Parameter specified by design; not subject to production test.

**Table 6. Switching ( $V_{CC} = 13\text{ V}$ ;  $-40^{\circ}\text{C} < T_j < 150^{\circ}\text{C}$ , unless otherwise specified)<sup>(1)</sup>**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$t_{d(on)}$	Turn-on delay time at $T_j = 25^{\circ}\text{C}$	$R_L = 4.3\ \Omega$	10	60	120	$\mu\text{s}$
$t_{d(off)}$	Turn-off delay time at $T_j = 25^{\circ}\text{C}$	$R_L = 4.3\ \Omega$	10	40	100	
$(dV_{OUT}/dt)_{on}$	Turn-on voltage slope at $T_j = 25^{\circ}\text{C}$	$R_L = 4.3\ \Omega$	0.1	0.28	0.7	$\text{V}/\mu\text{s}$
$(dV_{OUT}/dt)_{off}$	Turn-off voltage slope at $T_j = 25^{\circ}\text{C}$	$R_L = 4.3\ \Omega$	0.1	0.32	0.7	
$W_{ON}$	Switching energy losses at turn-on ( $t_{won}$ )	$R_L = 4.3\ \Omega$	—	0.36	$0.54^{(2)}$	mJ
$W_{OFF}$	Switching energy losses at turn-off ( $t_{woff}$ )	$R_L = 4.3\ \Omega$	—	0.37	$0.54^{(2)}$	mJ
$t_{SKEW}$	Differential Pulse skew ( $t_{PHL} - t_{PLH}$ ) see <a href="#">Figure 6</a>	$R_L = 4.3\ \Omega$	-75	-25	25	$\mu\text{s}$

1. See [Figure 6: Switching times and Pulse skew](#).

2. Parameter guaranteed by design and characterization; not subject to production test.

## 3 Protections

### 3.1 Power limitation

The basic working principle of this protection consists of an indirect measurement of the junction temperature swing  $\Delta T_j$  through the direct measurement of the spatial temperature gradient on the device surface in order to automatically shut off the output MOSFET as soon as  $\Delta T_j$  exceeds the safety level of  $\Delta T_{j\_SD}$ . According to the voltage level on the FaultRST pin, the output MOSFET switches on and cycles with a thermal hysteresis according to the maximum instantaneous power which can be handled (FaultRST = Low) or remains off (FaultRST = High). The protection prevents fast thermal transient effects and, consequently, reduces thermo-mechanical fatigue.

### 3.2 Thermal shutdown

In case the junction temperature of the device exceeds the maximum allowed threshold (typically 175°C), it automatically switches off and the diagnostic indication is triggered. According to the voltage level on the FaultRST pin, the device switches on again as soon as its junction temperature drops to  $T_R$  (see [Table 8](#), FaultRST = Low) or remains off (FaultRST = High).

### 3.3 Current limitation

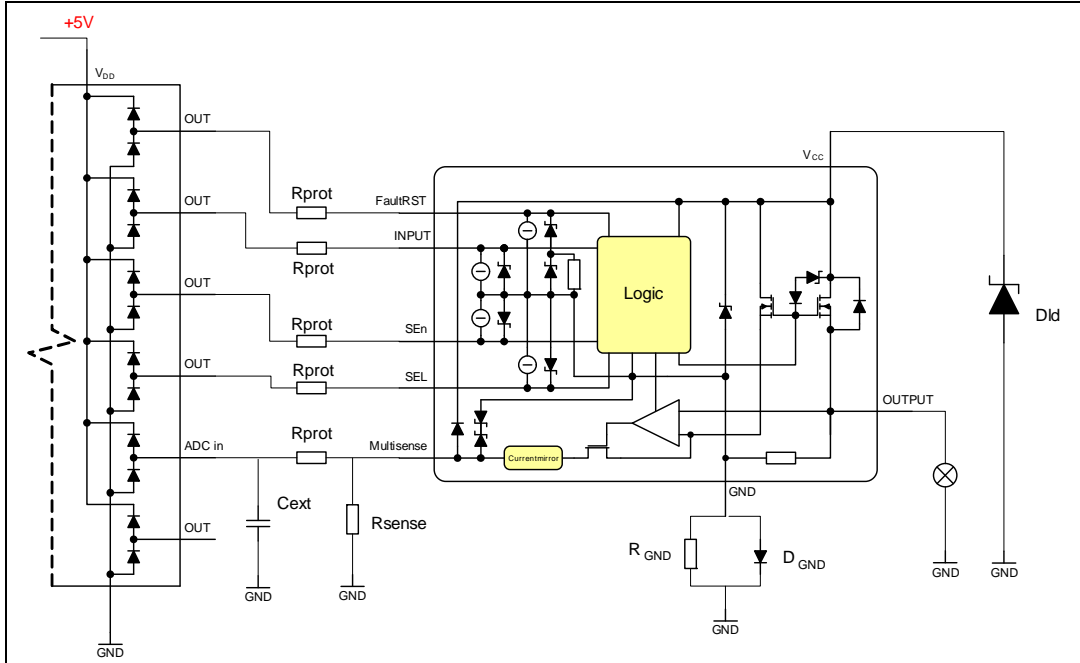

The device is equipped with an output current limiter in order to protect the silicon as well as the other components of the system (e.g. bonding wires, wiring harness, connectors, loads, etc.) from excessive current flow. Consequently, in case of short circuit, overload or during load power-up, the output current is clamped to a safety level,  $I_{LIMH}$ , by operating the output power MOSFET in the active region.

### 3.4 Negative voltage clamp

In case the device drives inductive load, the output voltage reaches negative value during turn off. A negative voltage clamp structure limits the maximum negative voltage to a certain value,  $V_{DEMAG}$  (see [Table 8](#)), allowing the inductor energy to be dissipated without damaging the device.

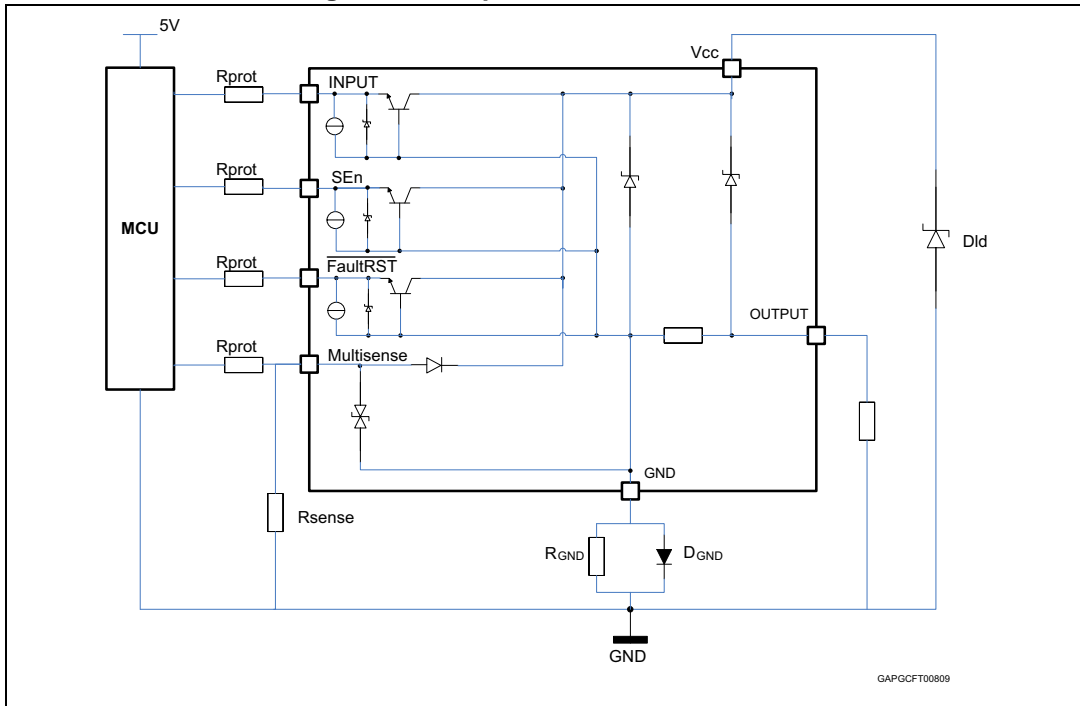

## 4 Application information

Figure 35. Application diagram

### 4.1 GND protection network against reverse battery

Figure 36. Simplified internal structure

### 4.1.1 Diode ( $D_{GND}$ ) in the ground line

A resistor (typ.  $R_{GND} = 4.7\text{ k}\Omega$ ) should be inserted in parallel to  $D_{GND}$  if the device drives an inductive load.

This small signal diode can be safely shared amongst several different HSDs. Also in this case, the presence of the ground network produces a shift ( $\approx 600\text{ mV}$ ) in the input threshold and in the status output values if the microprocessor ground is not common to the device ground. This shift does not vary if more than one HSD shares the same diode/resistor network.

## 4.2 Immunity against transient electrical disturbances

The immunity of the device against transient electrical emissions, conducted along the supply lines and injected into the  $V_{CC}$  pin, is tested in accordance with ISO7637-2:2011 (E) and ISO 16750-2:2010.

The related function performance status classification is shown in [Table 12](#).

Test pulses are applied directly to DUT (Device Under Test) both in ON and OFF-state and in accordance to ISO 7637-2:2011(E), chapter 4. The DUT is intended as the present device only, without components and accessed through  $V_{CC}$  and GND terminals.

Status II is defined in ISO 7637-1 Function Performance Status Classification (FPSC) as follows: "The function does not perform as designed during the test but returns automatically to normal operation after the test".

**Table 12. ISO 7637-2 - electrical transient conduction along supply line**

Test Pulse 2011(E)	Test pulse severity level with Status II functional performance status		Minimum number of pulses or test time	Burst cycle / pulse repetition time		Pulse duration and pulse generator internal impedance
	Level	$U_S^{(1)}$		min	max	
1	III	-112V	500 pulses	0,5 s		2ms, 10 $\Omega$
2a	III	+55V	500 pulses	0,2 s	5 s	50 $\mu$ s, 2 $\Omega$
3a	IV	-220V	1h	90 ms	100 ms	0.1 $\mu$ s, 50 $\Omega$
3b	IV	+150V	1h	90 ms	100 ms	0.1 $\mu$ s, 50 $\Omega$
4 <sup>(2)</sup>	IV	-7V	1 pulse			100ms, 0.01 $\Omega$
<b>Load dump according to ISO 16750-2:2010</b>						
Test B <sup>(3)</sup>		40V	5 pulse	1 min		400ms, 2 $\Omega$

1.  $U_S$  is the peak amplitude as defined for each test pulse in ISO 7637-2:2011(E), chapter 5.6.
2. Test pulse from ISO 7637-2:2004(E).
3. With 40 V external suppressor referred to ground ( $-40^\circ\text{C} < T_j < 150^\circ\text{C}$ ).

### 4.3 MCU I/Os protection

If a ground protection network is used and negative transients are present on the  $V_{CC}$  line, the control pins will be pulled negative. ST suggests to insert a resistor ( $R_{prot}$ ) in line both to prevent the microcontroller I/O pins to latch-up and to protect the HSD inputs.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of microcontroller I/Os.

#### Equation 1

$$V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH} - V_{GND}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -150\text{ V}$ ;  $I_{latchup} \geq 20\text{ mA}$ ;  $V_{OH\mu C} \geq 4.5\text{ V}$

$$7.5\text{ k}\Omega \leq R_{prot} \leq 140\text{ k}\Omega.$$

Recommended values:  $R_{prot} = 15\text{ k}\Omega$

### 4.4 Multisense - analog current sense

Diagnostic information on device and load status are provided by an analog output pin (Multisense) delivering the following signals:

- Current monitor: current mirror of channel output current
- $V_{CC}$  monitor: voltage proportional to  $V_{CC}$
- $T_{CASE}$ : voltage proportional to chip temperature

Those signals are routed through an analog multiplexer which is configured and controlled by means of SELx and SEN pins, according to the address map in [Table 11](#).

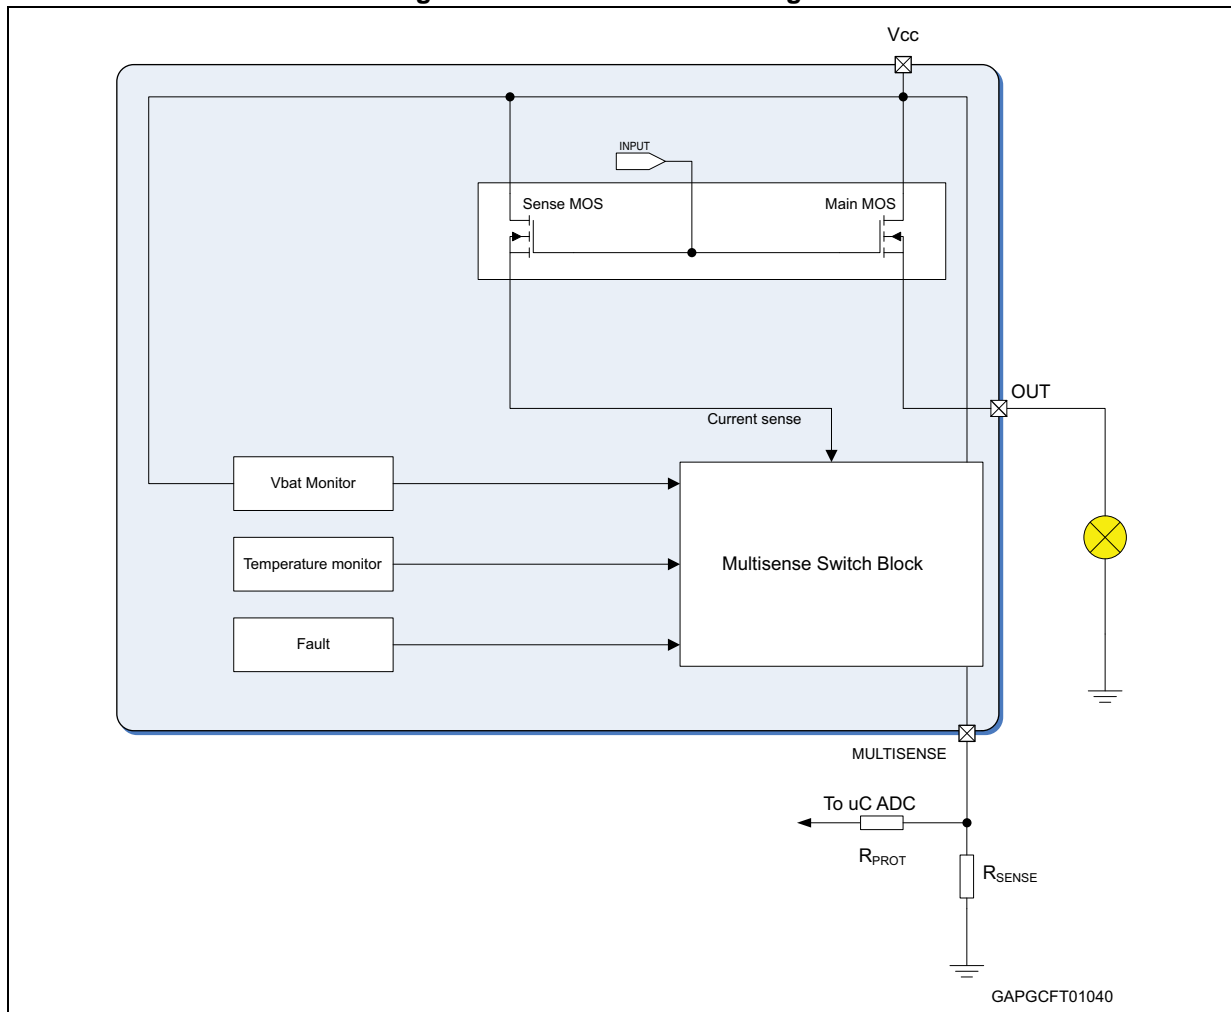

Figure 37. Multisense and diagnostic – block diagram

#### 4.4.1 Principle of Multisense signal generation

Figure 38. Multisense block diagram

##### Current monitor

When current mode is selected in the Multisense, this output is capable to provide:

- **Current mirror proportional to the load current in normal operation**, delivering current proportional to the load according to known ratio named **K**
- **Diagnostics flag in fault conditions** delivering fixed voltage  $V_{SENSEH}$

The current delivered by the current sense circuit,  $I_{SENSE}$ , can be easily converted to a voltage  $V_{SENSE}$  by using an external sense resistor,  $R_{SENSE}$ , allowing continuous load monitoring and abnormal condition detection.

##### Normal operation (channel ON, no fault, SEn active)

While device is operating in normal conditions (no fault intervention),  $V_{SENSE}$  calculation can be done using simple equations

Current provided by Multisense output:  $I_{SENSE} = I_{OUT}/K$

Voltage on  $R_{SENSE}$ :  $V_{SENSE} = R_{SENSE} \cdot I_{SENSE} = R_{SENSE} \cdot I_{OUT}/K$

Where :

- $V_{SENSE}$  is voltage measurable on  $R_{SENSE}$  resistor
- $I_{SENSE}$  is current provided from Multisense pin in current output mode
- $I_{OUT}$  is current flowing through output
- K factor represent the ratio between PowerMOS cells and SenseMOS cells; its spread includes geometric factor spread, current sense amplifier offset and process parameters spread of overall circuitry specifying ratio between  $I_{OUT}$  and  $I_{SENSE}$ .

**Failure flag indication**

In case of power limitation/overtemperature, the fault is indicated by the Multisense pin which is switched to a “current limited” voltage source,  $V_{SENSEH}$  (see [Table 9](#)).

In any case, the current sourced by the Multisense in this condition is limited to  $I_{SENSEH}$  (see [Table 9](#)).

The typical behavior in case of overload or hard short circuit is shown in [Figure 10](#), [Figure 11](#) and [Figure 12](#).

**Figure 39. Analogue HSD – open-load detection in off-state**

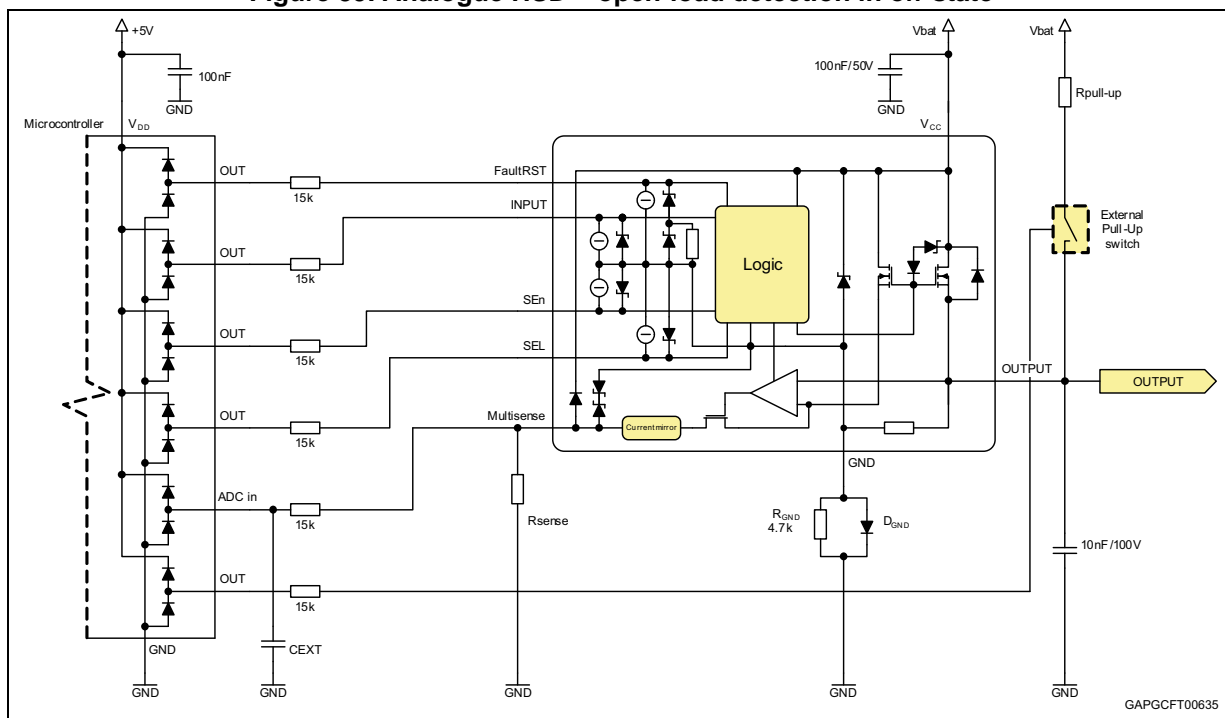

Figure 40. Open-load / short to  $V_{CC}$  condition

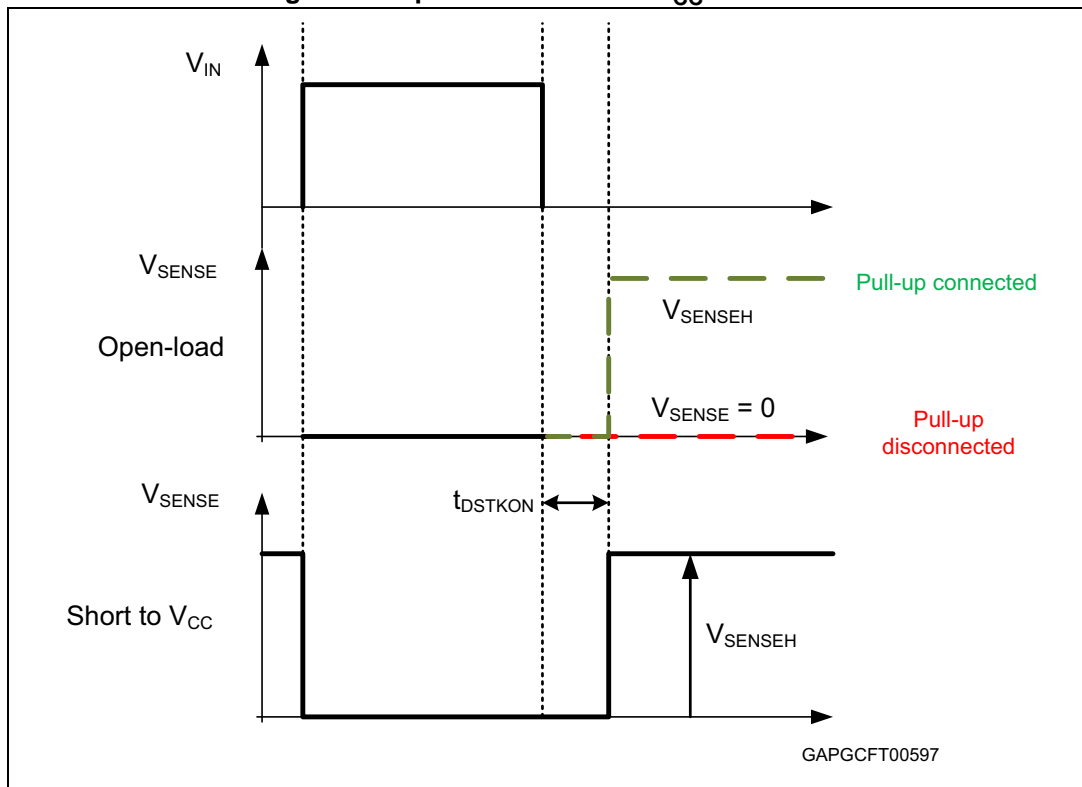

Table 13. Multisense pin levels in off-state

Condition	Output	Multisense	SEn
Open-load	$V_{OUT} > V_{OL}$	Hi-Z	L
		$V_{SENSEH}$	H
	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H
Short to $V_{CC}$	$V_{OUT} > V_{OL}$	Hi-Z	L
		$V_{SENSEH}$	H
Nominal	$V_{OUT} < V_{OL}$	Hi-Z	L
		0	H

#### 4.4.2 $T_{CASE}$ and $V_{CC}$ monitor

In this case, MultiSense output operates in voltage mode and output level is referred to device GND. Care must be taken in case a GND network protection is used, because of a voltage shift is generated between device GND and the microcontroller input GND reference.

Figure 41 shows link between  $V_{MEASURED}$  and real  $V_{SENSE}$  signal.

Figure 41. GND voltage shift

### V<sub>CC</sub> monitor

Battery monitoring channel provides  $V_{SENSE} = V_{CC} / 4$ .

### Case temperature monitor

Case temperature monitor is capable to provide information about actual device temperature. Since diode is used for temperature sensing, following equation describe link between temperature and output  $V_{SENSE}$  level:

$$V_{SENSE\_TC}(T) = V_{SENSE\_TC}(T_0) + dV_{SENSE\_TC} / dT * (T - T_0)$$

where  $dV_{SENSE\_TC} / dT \sim$  typically  $-5.5 \text{ mV/K}$  (for temperature range  $(-40^\circ\text{C}$  to  $+150^\circ\text{C})$ ).

### 4.4.3 Short to V<sub>CC</sub> and OFF-state open-load detection

Short to V<sub>CC</sub>

A short circuit between V<sub>CC</sub> and output is indicated by the relevant current sense pin set to V<sub>SENSEH</sub> during the device off-state. Small or no current is delivered by the current sense during the on-state depending on the nature of the short circuit.

OFF-state open-load with external circuitry

Detection of an open-load in off mode requires an external pull-up resistor R<sub>PU</sub> connecting the output to a positive supply voltage V<sub>PU</sub>.

It is preferable V<sub>PU</sub> to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

R<sub>PU</sub> must be selected in order to ensure  $V_{OUT} > V_{OLmax}$  in accordance with to following equation:

#### Equation 2

$$R_{PU} < \frac{V_{PU} - 4}{I_{L(off2)min} @ 4V}$$

### 4.5 Maximum demagnetization energy ( $V_{CC} = 16\text{ V}$ )

Figure 42. Maximum turn off current versus inductance

- Values are generated with  $R_{\theta} = 0\ \Omega$ .  
In case of repetitive pulses,  $T_{jstart}$  (at the beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.

## 5 Package and PCB thermal data

### 5.1 PowerSSO-16 thermal data

Figure 43. PowerSSO-16 on two-layers PCB (2s0p to JEDEC JESD 51-5)

Figure 44. PowerSSO-16 on four-layers PCB (2s2p to JEDEC JESD 51-7)

Table 14. PCB properties

Dimension	Value
Board finish thickness	1.6 mm +/- 10%
Board dimension	77 mm x 86 mm
Board Material	FR4
Copper thickness (top and bottom layers)	0.070 mm
Copper thickness (inner layers)	0.035 mm
Thermal vias separation	1.2 mm
Thermal via diameter	0.3 mm +/- 0.08 mm
Copper thickness on vias	0.025 mm
Footprint dimension (top layer)	2.2 mm x 3.9 mm
Heatsink copper area dimension (bottom layer)	Footprint, 2 cm <sup>2</sup> or 8 cm <sup>2</sup>

Figure 45.  $R_{thj-amb}$  vs PCB copper area in open box free air condition (one channel on)

Figure 46. PowerSSO-16 thermal impedance junction ambient single pulse (one channel on)

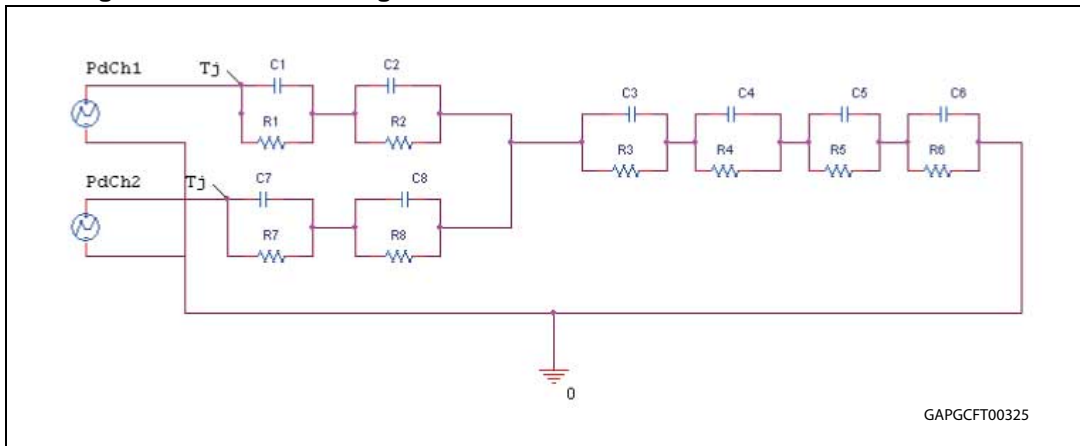

Equation 3: pulse calculation formula

$$Z_{TH\delta} = R_{TH} \cdot \delta + Z_{THtp}(1 - \delta)$$

where  $\delta = t_p/T$

Figure 47. Thermal fitting model of a double-channel HSD in PowerSSO-16

1. The fitting model is a simplified thermal tool and is valid for transient evolutions where the embedded protections (power limitation or thermal cycling during thermal shutdown) are not triggered.

Table 15. Thermal parameters

Area/island (cm <sup>2</sup> )	Footprint	2	8	4L
R1 = R7 (°C/W)	0.5			
R2 = R8 (°C/W)	2			
R3 (°C/W)	7			3.5
R4 (°C/W)	16	6	6	4
R5 (°C/W)	30	20	10	3
R6 (°C/W)	26	20	18	7
C1 = C7 (W.s/°C)	0.05			
C2 = C8 (W.s/°C)	0.01			
C3 (W.s/°C)	0.1			
C4 (W.s/°C)	0.2	0.3	0.3	0.4
C5 (W.s/°C)	0.4	1	1	4
C6 (W.s/°C)	3	5	7	18

## 6 Package information

### 6.1 ECOPACK®

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com).

ECOPACK® is an ST trademark.

### 6.2 PowerSSO-16 package information
