74LVCH322245A

32-bit bus transceiver with direction pin; 30 Ω series termination resistors; 5 V tolerant; 3-state

Rev. 4 — 20 December 2011 **Product data sheet**

1. General description

The 74LVCH322245A is a 32-bit transceiver featuring non-inverting 3-state bus compatible outputs in both send and receive directions. The device features four output enable ($n\overline{OE}$) inputs for easy cascading and four send/receive (nDIR) inputs for direction control. Pin $n\overline{OE}$ controls the outputs so that the buses are effectively isolated. The device is designed with 30 Ω series termination resistors in both HIGH and LOW output stages to reduce line noise.

Inputs can be driven from either 3.3 V or 5 V devices. When disabled, up to 5.5 V can be applied to the outputs. These features allow the use of these devices in mixed 3.3 V and 5 V applications.

To ensure the high-impedance state during power-up or power-down, pin $n\overline{OE}$ should be tied to V_{CC} through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

Bus hold on data inputs eliminates the need for external pull-up resistors to hold unused inputs.
