

# UBA2021

## 630 V driver IC for CFL and TL lamps

Rev. 04 — 25 July 2008

Product data sheet

### 1. General description

The UBA2021 is a high voltage IC intended to drive and control Compact Fluorescent Lamps (CFL) or fluorescent TL lamps. It contains a driver circuit for an external half-bridge, an oscillator and a control circuit for starting up, preheating, ignition, lamp burning and protection.

### 2. Features

- Adjustable preheat and ignition time.
- Adjustable preheat current.
- Adjustable lamp power.
- Lamp power independent from mains voltage variations.
- Overpower protection.
- Lamp temperature stress protection at higher mains voltages.
- Capacitive mode protection.
- Protection against a drive voltage that is too low for the power MOSFETs.

### 3. Quick reference data

Table 1. Quick reference data

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>High voltage supply</b>						
$V_{FS}$	high side supply voltage	$I_{FS} < 15 \mu A$ ; $t < 0.5 s$	-	-	630	V
<b>Start-up state</b>						
$V_{VS(start)}$	oscillator start voltage		-	11.95	-	V
$V_{VS(stop)}$	oscillator stop voltage		-	10.15	-	V
$I_{VS(standby)}$	standby current	$V_{VS} = 11 V$	-	200	-	$\mu A$
<b>Preheat mode</b>						
$f_{start}$	start frequency		-	108	-	kHz
$t_{ph}$	preheat time	$C_{CP} = 100 nF$	-	666	-	ms
$V_{RS(ctrl)}$	control voltage at pin RS		-	-600	-	mV
<b>Frequency sweep to ignition</b>						
$f_B$	bottom frequency		-	42.9	-	kHz
$t_{ign}$	ignition time		-	625	-	ms
<b>Normal operation</b>						
$f_B$	bottom frequency		-	42.9	-	kHz
$t_{no}$	non-overlap time		-	1.4	-	$\mu s$

Table 1. Quick reference data

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$I_{tot}$	total supply current	$f_B = 43\text{ kHz}$	-	1	-	mA
$R_{G1(on)}, R_{G2(on)}$	high and low side on resistance		-	126	-	$\Omega$
$R_{G1(off)}, R_{G2(off)}$	high and low side off resistance		-	75	-	$\Omega$
<b>Feed-forward</b>						
$f_{ff}$	feed-forward frequency	$I_{RHV} = 0.75\text{ mA}$	-	63.6	-	kHz
		$I_{RHV} = 1.0\text{ mA}$	-	84.5	-	kHz
$I_{i(RHV)}$	operating range of input current at pin RHV		0	-	1000	$\mu\text{A}$

4. Ordering information

Table 2. Ordering information

Type number	Package		Version
	Name	Description	
UBA2021T	SO14	plastic small outline package; 14 leads; body width 3.9 mm	SOT108-1
UBA2021P	DIP14	plastic dual in-line package; 14 leads (300 mil)	SOT27-1

5. Block diagram

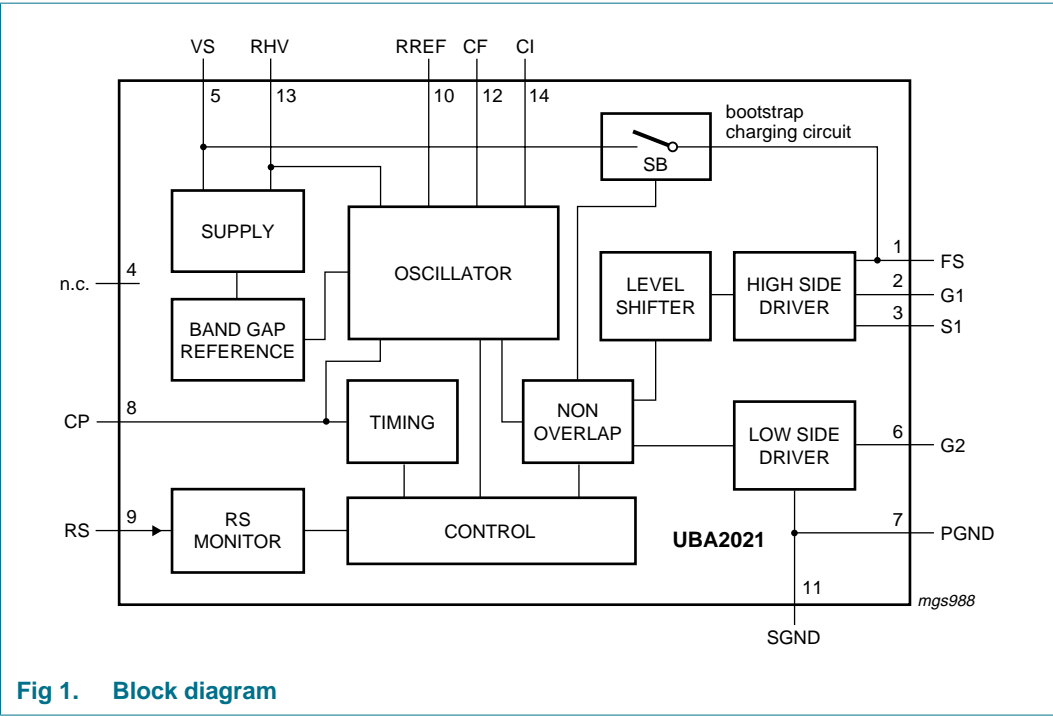

Fig 1. Block diagram

6. Pinning information

6.1 Pinning

6.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
FS	1	high side floating supply voltage
G1	2	gate high transistor (T1)
S1	3	source high transistor (T1)
n.c.	4	high-voltage spacer, not to be connected
VS	5	low voltage supply
G2	6	gate low transistor (T2)
PGND	7	power ground
CP	8	timing/averaging capacitor
RS	9	current monitoring input
RREF	10	reference resistor
SGND	11	signal ground
CF	12	oscillator capacitor
RHV	13	start-up resistor/feed-forward resistor
CI	14	integrating capacitor

7. Functional description

7.1 Introduction

The UBA2021 is an integrated circuit for electronically ballasted compact fluorescent lamps and their derivatives operating with mains voltages up to 240 V (RMS). It provides all the necessary functions for preheat, ignition and on-state operation of the lamp. In addition to the control function, the IC provides level shift and drive functions for the two discrete power MOSFETs, T1 and T2 (see [Figure 7](#)).

## 7.2 Initial start-up

Initial start-up is achieved by charging capacitor CS9 with the current applied to the RHV-pin. At start-up, MOSFET T2 conducts and T1 does not conduct. This ensures  $C_{boot}$  becomes charged. This start-up state is reached for a supply voltage of  $V_{VS(reset)}$ . This is the voltage level on the VS-pin at which the circuit will be reset to its initial state and maintained until the low voltage supply ( $V_{VS}$ ) reaches a value of  $V_{VS(start)}$ . The circuit is reset to the start-up state.

## 7.3 Oscillation

When the low voltage supply ( $V_{VS}$ ) has reached the value of  $V_{VS(start)}$  the circuit starts oscillating in the preheat state. The internal oscillator is a current-controlled circuit which generates a sawtooth waveform. The frequency of the sawtooth is determined by the capacitor  $C_{CF}$  and the current out of the CF-pin, mainly set by  $R_{REF}$ . The sawtooth frequency is twice the frequency of the signal across the load. The IC brings MOSFETs T1 and T2 alternately into conduction with a duty factor of approximately 50 %. [Figure 4](#) represents the timing of the IC. The circuit block 'non-overlap' generates a non-overlap time  $t_{no}$  that ensures conduction periods of exclusively T1 or T2. Time  $t_{no}$  is dependent on the reference current  $I_{REF}$ .

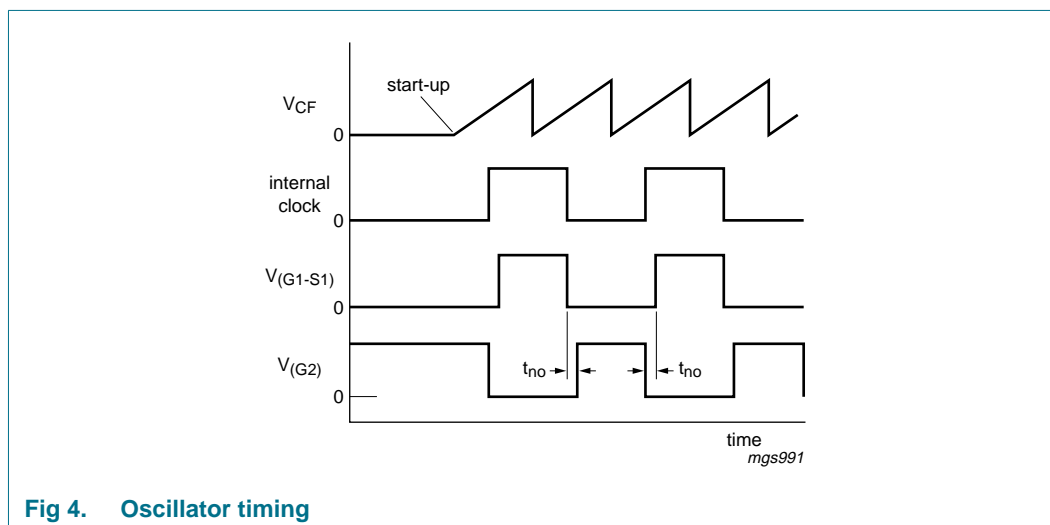

Fig 4. Oscillator timing

## 7.4 Operation in the preheat mode

The circuit starts oscillating at approximately  $2.5 \times f_B$  (108 kHz). The frequency gradually decreases until a defined value of current  $I_{shunt}$  is reached (see [Figure 5](#)). The slope of the decrease in frequency is determined by capacitor  $C_{Cl}$ . The frequency during preheating is approximately 90 kHz. This frequency is well above the resonant frequency of the load, which means that the lamp is off, the load only consists of L2, C5 and the electrode resistance. The preheat time is determined by capacitor  $C_{CP}$ . The circuit can be locked in the preheat state by connecting the CP-pin to ground. During preheating, the circuit monitors the load current by measuring the voltage drop over external resistor  $R_{shunt}$  at the end of conduction of T2 with decision level  $V_{RS(ctrl)}$ . The frequency is decreased as long as  $V_{RS} > V_{RS(ctrl)}$ . The frequency is increased for  $V_{RS} < V_{RS(ctrl)}$ .

Fig 5. Operation in the preheat mode

## 7.5 Ignition state

The RS monitoring function changes from  $V_{RS(ctrl)}$  regulation to capacitive mode protection at the end of the preheat time. Normally this results in a further frequency decrease down to the bottom frequency  $f_B$  (approximately 43 kHz). The rate of change of frequency in the ignition state is less than that in the preheat mode. During the downward frequency sweep the circuit sweeps through the resonant frequency of the load. A high voltage then appears across the lamp. This voltage normally ignites the lamp.

## 7.6 Failure to ignite

Excessive current levels may occur if the lamp fails to ignite. The IC does not limit these currents in any way.

## 7.7 Transition to the burn state

Assuming that the lamp has ignited during the downward frequency sweep, the frequency normally decreases to the bottom frequency. The IC can transit to the burn state in two ways:

1. In the event that the bottom frequency is not reached, transition is made after reaching the ignition time  $t_{ign}$ .
2. As soon as the bottom frequency is reached.

The bottom frequency is determined by  $R_{REF}$  and  $C_{CF}$ .

## 7.8 Feed-forward frequency

During burn state a feed-forward mechanism ensures that the lamp power will not increase above the maximum allowed value due to an increased mains voltage. In the feed-forward range the UBA2021 driver IC can be configured in such a way that the application is optimized for close to constant lamp power. Above a defined voltage level the oscillation frequency also depends on the supply voltage of the half-bridge (see [Figure 6](#)). The current for the current controlled oscillator is derived from the current through  $R_{RHV}$  in the feed-forward range. The feed-forward frequency is proportional to the average value of the current through  $R_{RHV}$  within the operating range of  $I_{i(RHV)}$ , given the lower limit set by  $f_B$ . For currents beyond the operating range (i.e. between 1.0 mA and 1.6 mA) the feed-forward frequency is clamped. In order to prevent feed-forward of ripple on

$V_{in}$ , the ripple is filtered out. The capacitor connected to the CP-pin is used for this purpose. This pin is also used in the preheat state and the ignition state for timing ( $t_{ph}$  and  $t_{ign}$ ).

Fig 6. Feed-forward frequency

## 7.9 Capacitive mode protection

When the preheat mode is completed, the IC will protect the power circuit against losing the zero voltage switching condition and getting too close to the capacitive mode of operation. This is detected by monitoring voltage  $V_{RS}$  at the RS-pin. If the voltage is below  $V_{RS(cap)}$  at the time of turn-on of T2, the capacitive mode operation is assumed. Consequently the frequency increases as long as the capacitive mode is detected. The frequency decreases down to the feed-forward frequency if no capacitive mode is detected. Frequency modulation is achieved via the CI-pin.

## 7.10 IC supply

Initially, the IC is supplied from  $V_{in}$  by the current through  $R_{RHV}$ . This current charges the supply capacitor CS9 via an internal diode. As soon as  $V_{VS}$  exceeds  $V_{VS(start)}$ , the circuit starts oscillating. After the preheat phase is finished, the pin is connected to an internal resistor  $R_{i(RHV)}$ , prior to this the RHV-pin is internally connected to the VS-pin. The voltage level at the RHV-pin thus drops from  $V_{VS} + V_{diode}$  to  $I_{RHV} \times R_{i(RHV)}$ . The capacitor CS9 at the VS-pin will now be charged via the snubber capacitor CS7. Excess charge is drained by an internal clamp that turns on at voltage  $V_{VS(clamp)}$ .

## 7.11 Minimum gate-source voltage of T1 and T2

The high side driver is supplied via capacitor  $C_{boot}$ . Capacitor  $C_{boot}$  is charged via the bootstrap switch during the on periods of T2. The IC stops oscillating at a voltage level  $V_{VS(stop)}$ . Given a maximum charge consumption on the load at the G1-pin of 1 nC/V, this safeguards the minimum drive voltages  $V_{(G1-S1)}$  for the high side driver, see [Table 1](#).

Table 4. Minimum gate-source voltages

FREQUENCY	VOLTAGE
< 75 kHz	8 V (min)
75 kHz to 85 kHz	7 V (min)
$\geq 85$ kHz	6 V (min)

The drive voltage at G2 will exceed the drive voltage of the high side driver.

### 7.12 Frequency and change in frequency

At any point in time during oscillation, the circuit will operate between  $f_B$  and  $f_{start}$ . Any change in frequency will be gradual, no steps in frequency will occur. Changes in frequency caused by a change in voltage at the CI-pin show a rather constant  $\Delta f/\Delta t$  over the entire frequency range. The following rates are realized (at a frequency of 85 kHz and with a 100 nF capacitor connected to the PCI-pin):

- For any increase in frequency:  $\Delta f/\Delta t$  is between 15 kHz/ms and 37.5 kHz/ms.
- During preheat and normal operation:  $\Delta f/\Delta t$  for a decrease in frequency is between –6 kHz/ms and –15 kHz/ms.
- During the ignition phase:  $\Delta f/\Delta t$  for a decrease in frequency is between –150 Hz/ms and –375 Hz/ms.

### 7.13 Ground pins

The PGND-pin is the ground reference of the IC with respect to the application. As an exception the SGND-pin provides a local ground reference for the components connected to the CP-pin, CI-pin, RREF-pin and the CF-pin. For this purpose the PGND-pin and SGND-pin are short circuited internally. External connection of the PGND-pin and the SGND-pin is not preferred. The sum of currents flowing out of the CP-pin, CI-pin, RREF-pin, CF-pin and the SGND-pin must remain zero at all time.

### 7.14 Charge coupling

Due to parasitic capacitive coupling to the high voltage circuitry, all pins are burdened with a repetitive charge injection. Given the typical application in [Figure 7](#), the RREF-pin and the CF-pin are sensitive to this charge injection. For the rating  $Q_{couple}$  a safe functional operation of the IC is guaranteed, independent of the current level. Charge coupling at current levels below 50 mA will not interfere with the accuracy of the  $V_{RS(cap)}$  and  $V_{RS(ctrl)}$  levels. Charge coupling at current levels below 20 mA will not interfere with the accuracy of any parameter.

## 8. Limiting values

**Table 5. Limiting values**

*In accordance with the Absolute Maximum Rating System (IEC 60134). All voltages referenced to ground.*

Symbol	Parameter	Conditions	Min	Max	Unit
$V_{FS}$	high side floating supply voltage	operating	-	570	V
		$t \leq 0.5$ s	-	630	V
$I_{VS(clamp)}$	clamp current		-	35	mA
$V_{RS}$	input voltage pin RS		-2.5	+2.5	V
		transient of 50 ns	-15	+2.5	V
SR	slew rate at pins S1, G1 and FS (with respect to ground)		-4	+4	V/ns
P	power dissipation		-	500	mW
$T_{amb}$	ambient temperature		-40	+150	°C
$T_j$	junction temperature		-40	+150	°C

**Table 5. Limiting values ...continued**

In accordance with the Absolute Maximum Rating System (IEC 60134). All voltages referenced to ground.

Symbol	Parameter	Conditions	Min	Max	Unit
$T_{stg}$	storage temperature		-55	+150	°C
$Q_{couple}$	charge coupling at pins RREF and CF	operating	-8	+8	pC
$V_{es}$	electrostatic handling voltage	human body model [1]	-	2000	V
		machine model [2]	-	250	V

[1] HBM: 2000 V, except pins FS, G1, S1 and VS which are 1000 V maximum and G2 which is 800 V maximum.

[2] MM: 250 V except for the G1-pin which is 100 V.

## 9. Thermal characteristics

**Table 6. Thermal characteristics**

Symbol	Parameter	Conditions	Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient	in free air		
	S014		100	K/W
	DIP14		60	K/W
$R_{th(j-pin)}$	thermal resistance from junction to PCB	in free air		
	S014		50	K/W
	DIP14		30	K/W

## 10. Characteristics

**Table 7. Characteristics**

$V_{VS} = 11\text{ V}$ ;  $V_{FS} - V_{S1} = 11\text{ V}$ ;  $T_{amb} = 25\text{ °C}$ ; all voltages referenced to ground; unless otherwise specified. See [Figure 8](#).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>High voltage supply</b>						
$I_L$	leakage current on high voltage pins	$V_{FS}$ , $V_{G1}$ and $V_{S1} = 630\text{ V}$	-	-	15	μA
<b>Start-up state</b>						
$V_{VS(reset)}$	reset voltage	T1 off; T2 on	4	5.5	6.5	V
$V_{VS(start)}$	oscillator start voltage		11.35	11.95	12.55	V
$V_{VS(stop)}$	oscillator stop voltage		9.55	10.15	10.75	V
$V_{VS(hys)}$	supply voltage hysteresis		1.5	1.8	2	V
$I_{VS(standby)}$	standby supply current at pin VS	$V_{VS} = 11\text{ V}$ [1]	150	200	250	μA
$\Delta V_{(RHV-VS)}$	voltage difference between pins RHV and VS	$I_{RHV} = 1.0\text{ mA}$	0.7	0.8	1	V
$V_{VS(clamp-start)}$	clamp margin $V_{VS(clamp)}$ to $V_{VS(start)}$	[2]	0.2	0.3	0.4	V

**Table 7. Characteristics ...continued**

$V_{VS} = 11\text{ V}$ ;  $V_{FS} - V_{S1} = 11\text{ V}$ ;  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ; all voltages referenced to ground; unless otherwise specified. See [Figure 8](#).

$V_{VS} = 11\text{ V}$ ;  $V_{FS} - V_{S1} = 11\text{ V}$ ;  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ; all voltages referenced to ground; unless otherwise specified. See [Figure 8](#).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{ff}$	feed-forward frequency	$I_{RHV} = 0.75\text{ mA}$	60.4	63.6	66.15	kHz
		$I_{RHV} = 1\text{ mA}$	80.3	84.5	88.2	
$SYM_{ff}$	symmetry	$I_{RHV} = 1\text{ mA}$ <a href="#">[9]</a>	0.9	1	1.1	
RR	ripple rejection	$f_{Vin} = 100\text{ Hz}$	-	6	-	dB
$R_{CP(sw)}$	CP switch series resistance	$I_{CP} = 100\text{ }\mu\text{A}$	0.75	1.5	2.25	k $\Omega$
$R_{AV}$	averaging resistor	$I_{CP} = 10\text{ }\mu\text{A}$	22.4	32	41.6	k $\Omega$

- [1] The start-up supply current is specified in a temperature ( $T_{vj}$ ) range of  $0\text{ }^{\circ}\text{C}$  to  $125\text{ }^{\circ}\text{C}$ . For  $T_{vj} < 0\text{ }^{\circ}\text{C}$  and  $T_{vj} > 125\text{ }^{\circ}\text{C}$  the start-up supply current is  $< 350\text{ }\mu\text{A}$ .
- [2] The clamp margin is defined as the voltage difference between turn-on of the clamp and start of oscillation. The clamp is in the off-state at start of oscillation.
- [3] Data sampling of  $V_{RS(ctrl)}$  is performed at the end of conduction of T2.
- [4] The total supply current is specified in a temperature ( $T_{vj}$ ) range of  $-20\text{ }^{\circ}\text{C}$  to  $+125\text{ }^{\circ}\text{C}$ . For  $T_{vj} < -20\text{ }^{\circ}\text{C}$  and  $T_{vj} > 125\text{ }^{\circ}\text{C}$  the total supply current is  $< 1.5\text{ mA}$ .
- [5] Data sampling of  $V_{RS(cap)}$  is performed at the start of conduction of T2.
- [6] Within the allowed range of  $R_{RREF}$ , defined as  $30\text{ k}\Omega \pm 10\%$ .
- [7] Typical values for the on and off resistances at  $T_{vj} = 87.5\text{ }^{\circ}\text{C}$  are:  $R_{G2(on)}$  and  $R_{G1(on)} = 164\text{ }\Omega$ ,  $R_{G2(off)}$  and  $R_{G1(off)} = 100\text{ }\Omega$ .
- [8] The input current at RHV pin may increase to  $1600\text{ }\mu\text{A}$  during voltage transient at  $V_{in}$ . Only for currents  $I_{RHV}$  beyond approximately  $550\text{ }\mu\text{A}$  is the oscillator frequency proportional to  $I_{RHV}$ .
- [9] The symmetry  $SYM_{ff}$  is calculated from the quotient  $SYM_{ff} = T1_{tot} / T2_{tot}$ , with  $T1_{tot}$  the time between turn-off of G2 and turn-off of G1, and  $T2_{tot}$  the time between turn-off of G1 and turn-off of G2.

## 11. Design information

### 11.1 Design equations

- Bottom frequency:

$$f_B = \frac{I}{2 \times \{[(C_{CF} + C_{par}) \times (X1 \times R_{RREF} - R_{int})] + \tau\}} \quad (1)$$

- Feed-forward frequency:

$$f_{ff} = \frac{I}{2 \times \left\{ \left[ (C_{CF} + C_{par}) \times \left( \frac{X2 \times V_{RREF}}{I_{i(RHV)}} - R_{int} \right) \right] + \tau \right\}} \quad (2)$$

- Where:

- $X1 = 3.68$ .
- $X2 = 22.28$ .
- $\tau = 0.4\text{ }\mu\text{s}$ .
- $R_{int} = 3\text{ k}\Omega$ .
- $C_{par} = 4.7\text{ pF}$

- Operating frequency is the maximum of  $f_B$ ,  $f_{ff}$  or  $f_{cm}$ .

- Where:
- $f_B$  = bottom frequency.
- $f_{ff}$  = feed-forward frequency.
- $f_{cm}$  = frequency due to capacitive mode detection.

- Preheat time:  $t_{ph} = \frac{C_{CP}}{150nF} \times \frac{R_{RREF}}{30k\Omega}$

- Ignition time:  $t_{ign} = \frac{15}{16} \times t_{ph}$

- Non-overlap time:  $t_{no} = 1.4\mu s \times \frac{R_{RREF}}{30k\Omega}$

### 15.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 15.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

### 15.3 Disclaimers

**General** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use** — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in medical, military, aircraft, space or life support equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental

damage. NXP Semiconductors accepts no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

**Quick reference data** — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) may cause permanent damage to the device. Limiting values are stress ratings only and operation of the device at these or any other conditions above those given in the Characteristics sections of this document is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Terms and conditions of sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, including those pertaining to warranty, intellectual property rights infringement and limitation of liability, unless explicitly otherwise agreed to in writing by NXP Semiconductors. In case of any inconsistency or conflict between information in this document and such terms and conditions, the latter will prevail.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

### 15.4 Trademarks

Notice: All referenced brands, product names, service names and trademarks are the property of their respective owners.
