

CAT24C208

8 kb Dual Port Serial EEPROM

Description

The CAT24C208 is an 8 kb Dual Port Serial CMOS EEPROM internally organized as 4 segments of 256 bytes each. The CAT24C208 features a 16-byte page write buffer and can be accessed from either of two separate I²C compatible ports, DSP (SDA, SCL) and DDC (SDA, SCL).

Arbitration between the two interface ports is automatic and allows the appearance of individual access to the memory from each interface.

Features

- Supports Standard and Fast I²C Protocol
- 2.5 V to 5.5 V Operation
- 16-Byte Page Write Buffer
- Schmitt Triggers and Noise Protection Filters on I²C Bus Input
- Low Power CMOS Technology
- 1,000,000 Program/Erase Cycles
- 100 Year Data Retention
- Industrial Temperature Range
- SOIC 8-lead Package
- This Device is Pb-Free, Halogen Free/BFR Free, and RoHS Compliant

PIN CONFIGURATION

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 10 of this data sheet.

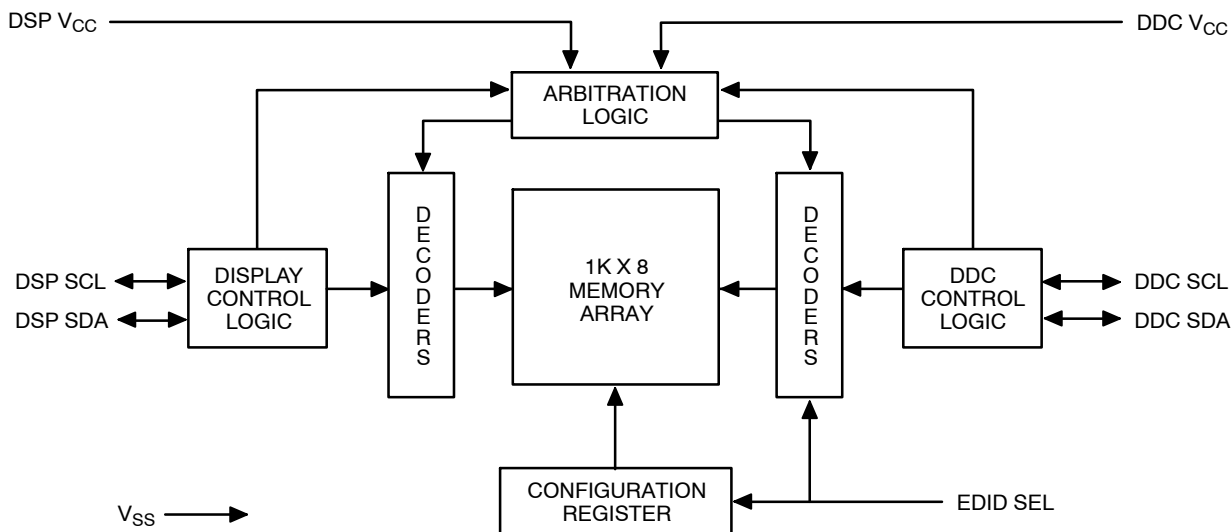

Figure 1. Block Diagram

CAT24C208

Table 1. PIN DESCRIPTION

| Pin Number | Pin Name | Function |
|------------|---------------------|---|
| 1 | DSP V _{CC} | Device power from display controller |
| 2 | DSP SCL | The CAT24C208 DSP serial clock bidirectional pin is used to clock all data transfers into or out of the device DSP SDA pin and is also used to block DSP Port access when DDC Port is active. |
| 3 | DSP SDA | DSP Serial Data/Address. The bidirectional DSP serial data/address pin is used to transfer data into and out of the device from a display controller. The DSP SDA pin is an open drain output and can be wireOR'ed with other open drain or open collector outputs. |
| 4 | V _{SS} | Device ground. |
| 5 | DDC SDA | DDC Serial Data/Address. The bidirectional DDC serial data/address pin is used to transfer data into and out of the device from a DDC host. The DDC SDA pin is an open drain output and can be wire-OR'ed with other open drain or open collector outputs. |
| 6 | DDC SCL | The CAT24C208 DDC serial clock bidirectional pin is used to clock all data transfers into or out of the device DDC SDA pin, and is used to block DDC Port for access when DSP Port is active. |
| 7 | EDID SEL | EDID select. The CAT24C208 EDID select input selects the active bank of memory to be accessed via the DDC SDA/SCL interface as set in the configuration register. |
| 8 | DDC V _{CC} | Device power when powered from a DDC host. |

Table 2. ABSOLUTE MAXIMUM RATINGS

| Parameters | Ratings | Units |
|--|-------------------------------|-------|
| Temperature Under Bias | -55 to +125 | °C |
| Storage Temperature | -65 to +150 | °C |
| Voltage on Any Pin with Respect to Ground (Note 1) | -2.0 to +V _{CC} +2.0 | V |
| V _{CC} with Respect to Ground | -2.0 to +7.0 | V |
| Package Power Dissipation Capability (T _A = 25°C) | 1.0 | W |
| Lead Soldering Temperature (10 secs) | 300 | °C |
| Output Short Circuit Current (Note 2) | 100 | mA |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. The minimum DC input voltage is -0.5 V. During transitions, inputs may undershoot to -2.0 V for periods of less than 20 ns. Maximum DC voltage on output pins is V_{CC} + 0.5 V, which may overshoot to V_{CC} + 2.0 V for periods of less than 20 ns.
2. Output shorted for no more than one second. No more than one output shorted at a time.

Table 3. RELIABILITY CHARACTERISTICS

| Symbol | Parameter | Reference Test Method | Min | Units |
|----------------------------------|--------------------|-------------------------------|-----------|-------------|
| N _{END} (Note 3) | Endurance | MIL-STD-883, Test Method 1033 | 1,000,000 | Cycles/Byte |
| T _{DR} (Note 3) | Data Retention | MIL-STD-883, Test Method 1008 | 100 | Years |
| V _{ZAP} (Note 3) | ESD Susceptibility | JEDEC Standard JESD 22 | 2000 | Volts |
| I _{LTH} (Notes 3 and 4) | Latch-up | JEDEC Standard 17 | 100 | mA |

3. This parameter is tested initially and after a design or process change that affects the parameter.
4. Latch-up protection is provided for stresses up to 100 mA on address and data pins from -1 V to V_{CC} +1 V.

Table 4. CAPACITANCE (T_A = 25°C, f = 1.0 MHz, V_{CC} = 5 V)

| Symbol | Parameter | Conditions | Min | Typ | Max | Units |
|---------------------------|--|------------------------|-----|-----|-----|-------|
| C _{I/O} (Note 5) | Input/Output Capacitance (Either DSP or DDC SDA) | V _{I/O} = 0 V | | | 8 | pF |
| C _{IN} (Note 5) | Input Capacitance (EDID, Either DSP or DDC SCL) | V _{IN} = 0 V | | | 6 | pF |

5. This parameter is tested initially and after a design or process change that affects the parameter.

CAT24C208

Table 5. D.C. OPERATING CHARACTERISTICS ($V_{CC} = 2.5\text{ V}$ to 5.5 V , unless otherwise specified.)

| Symbol | Parameter | Test Conditions | Min | Typ | Max | Units |
|------------|--|--|---------------------|-----|---------------------|---------------|
| I_{CC} | Power Supply Current | $f_{SCL} = 100\text{ KHz}$ | | | 3 | mA |
| I_{SB} | Standby Current ($V_{CC} = 5.0\text{ V}$) | $V_{IN} = \text{GND}$ or either DSP or DDC V_{CC} | | | 50 | μA |
| I_{LI} | Input Leakage Current | $V_{IN} = \text{GND}$ to either DSP or DDC V_{CC} | | | 10 | μA |
| I_{LO} | Output Leakage Current | $V_{OUT} = \text{GND}$ to either DSP or DDC V_{CC} | | | 10 | μA |
| V_{IL} | Input Low Voltage | | -1 | | $V_{CC} \times 0.3$ | V |
| V_{IH} | Input High Voltage | | $V_{CC} \times 0.7$ | | $V_{CC} + 0.5$ | V |
| VHYS | Input Hysteresis | | 0.05 | | | V |
| V_{OL1} | Output Low Voltage ($V_{CC} = 3\text{ V}$) | $I_{OL} = 3\text{ mA}$ | | | 0.4 | V |
| V_{CCL1} | Leakage DSP V_{CC} to DDC V_{CC} | | | | ± 100 | μA |
| V_{CCL2} | Leakage DDC V_{CC} to DSP V_{CC} | | | | ± 100 | μA |

Table 6. A.C. CHARACTERISTICS ($V_{CC} = 2.5\text{ V}$ to 5.5 V , unless otherwise specified.)

| Symbol | Parameter | Min | Max | Units |
|--------------------------------------|---|-----|-----|---------------|
| READ & WRITE CYCLE LIMITS | | | | |
| F_{SCL} | Clock Frequency | | 400 | kHz |
| T_I (Note 6) | Noise Suppression Time Constant at SCL, SDA Inputs | | 100 | ns |
| t_{AA} | SCL Low to SDA Data Out and ACK Out | | 0.9 | μs |
| t_{BUF} (Note 6) | Time the Bus Must be Free Before a New Transmission Can Start | 1.3 | | μs |
| $t_{HD:STA}$ | Start Condition Hold Time | 0.6 | | μs |
| t_{LOW} | Clock Low Period | 1.3 | | μs |
| t_{HIGH} | Clock High Period | 0.6 | | μs |
| $t_{SU:STA}$ | Start Condition Setup Time (for a Repeated Start Condition) | 0.6 | | μs |
| $t_{HD:DAT}$ | Data In Hold Time | 0 | | ns |
| $t_{SU:DAT}$ | Data In Setup Time | 100 | | ns |
| t_R (Note 6) | SDA and SCL Rise Time | | 300 | ns |
| t_F (Note 6) | SDA and SCL Fall Time | | 300 | ns |
| $t_{SU:STO}$ | Stop Condition Setup Time | 0.6 | | μs |
| t_{DH} | Data Out Hold Time | 100 | | ns |

Table 7. POWER-UP TIMING (Notes 6 and 7)

| Symbol | Parameter | Min | Typ | Max | Units |
|-----------|-----------------------------|-----|-----|-----|-------|
| t_{PUR} | Power-up to Read Operation | | | 1 | ms |
| t_{PUW} | Power-up to Write Operation | | | 1 | ms |

6. This parameter is tested initially and after a design or process change that affects the parameter.

7. t_{PUR} and t_{PUW} are the delays required from the time V_{CC} is stable until the specified operation can be initiated.

Table 8. WRITE CYCLE LIMITS

| Symbol | Parameter | Min | Typ | Max | Units |
|----------|------------------|-----|-----|-----|-------|
| t_{WR} | Write Cycle Time | | | 5 | ms |

The write cycle time is the time from a valid stop condition of a write sequence to the end of the internal program/erase cycle. During the write cycle, the bus interface circuits are disabled, SDA is allowed to remain high, and the device does not respond to its slave address.

Functional Description

The CAT24C208 has a total memory space of 1K bytes which is accessible from either of two I²C interface ports, (DSP_SDA and DSP_SCL) or (DDC_SDA and DDC_SCL), and with the use of segment pointer at address 60h. On power up and after any instruction, the segment pointer will be in segment 00h for DSP and in segment 00h of the bank selected by the configuration register for DDC.

The entire memory appears as contiguous memory space from the perspective of the display interface (DSP_SDA and DSP_SCL), see Figure 4, and Figures 14 to Figure 21 for a complete description of the DSP Interface.

A configuration register at addresses 62/63h is used to configure the operation and memory map of the device as seen from the DDC interface, (DDC_SDA and DDC_SCL).

Read and write operations can be performed on any location within the memory space from the display DSP interface regardless of the state of the EDID SEL pin or the activity on the DDC interface. From the DDC interface, the memory space appears as two 512 byte banks of memory,

with 2 segments each 00h and 01h in the upper and lower bank, see Figure 3.

Each bank of memory can be used to store an E-EDID data structure. However, only one bank can be read through the DDC port at a time. The active bank of memory (that is, the bank that appears at address A0h on the DDC port) is controlled through the configuration register at 62/63h and the EDID_SEL pin.

No write operations are possible from the DDC interface unless the DDC Write Enable bit is set (WE = 1) in the device configuration register at device address 62h.

The device automatically arbitrates between the two interfaces to allow the appearance of individual access to the memory from each interface.

In a typical E-EDID application the EDID_SEL pin is usually connected to the "Analog Cable Detect" pin of a VESA M1 compliant, dual-mode (analog and digital) display. In this manner, the E-EDID appearing at address A0h on the DDC port will be either the analog or digital E-EDID, depending on the state of the "Analog Cable Detect" pin (pin C3 of the M1-DA connector). See Figure 2.

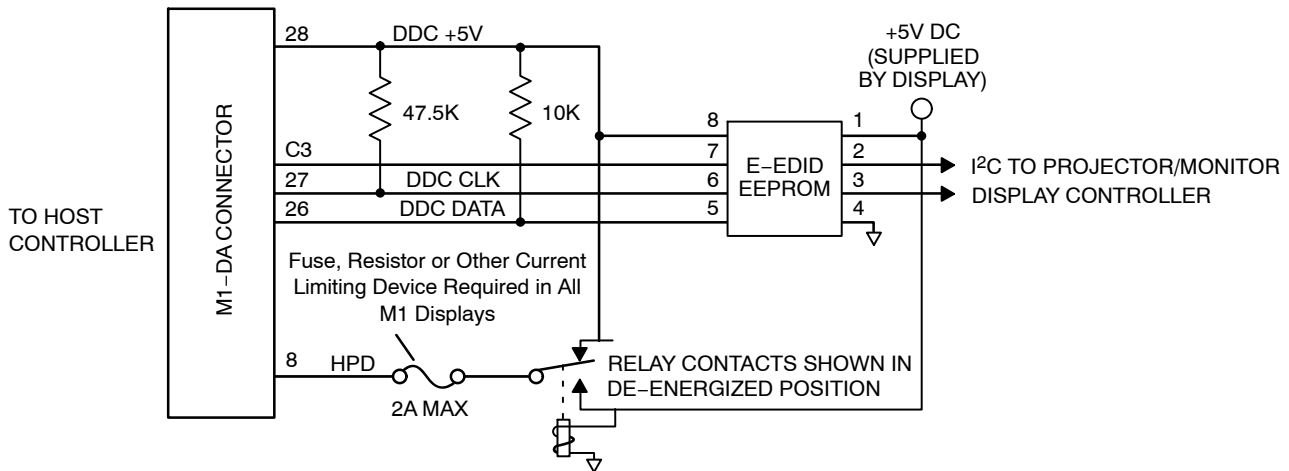

Figure 2.

Figure 3. DDC Interface

Figure 4. DSP Interface

I²C Bus Protocol

The following defines the features of the I²C bus protocol:

1. Data transfer may be initiated only when the bus is not busy.
2. During a data transfer, the data line must remain stable whenever the clock line is high. Any changes in the data line while the clock line is high will be interpreted as a START or STOP condition.

START Condition

The START Condition precedes all commands to the device, and is defined as a HIGH to LOW transition of either SDA when the respective SCL is HIGH. The CAT24C208 monitors the SDA and SCL lines and will not respond until this condition is met.

STOP Condition

A LOW to HIGH transition of SDA when SCL is HIGH determines the STOP condition. All operations must end with a STOP condition.

Acknowledge

After a successful data transfer, each receiving device is required to generate an acknowledge. The acknowledging device pulls down the respective SDA line during the ninth clock cycle, signaling that it received the 8 bits of data.

The CAT24C208 responds with an acknowledge after receiving a START condition and its slave address. If the device has been selected along with a write operation, it responds with an acknowledge after receiving each 8-bit byte.

When the CAT24C208 is in a READ mode it transmits 8 bits of data, releases the respective SDA line, and monitors the line for an acknowledge. Once it receives this acknowledge, the CAT24C208 will continue to transmit data. If no acknowledge is sent by the Master, the device terminates data transmission and waits for a STOP condition.

After an unsuccessful data transfer an acknowledge will not be issued (NACK) by the slave (CAT24C208), and the master should abort the sequence. If continued the device will read from or write to the wrong address in the two instruction format with the segment pointers.

Figure 5. Acknowledge Timing

Device Addressing

DDC Interface

Both the DDC and DSP interfaces to the device are based on the I²C bus serial interface. All memory space operations are done at the A0/A1 DDC address pair. As such, all write operations to the memory space are done at DDC address A0h and all read operations of the memory space are done at DDC address A1h.

Figure 6 shows the bit sequence of a random read from anywhere within the memory space. The word offset

determines which of the 256 bytes within segment 00h is being read. Here the segment 00h can be at the lower or upper bank depending on the configuration register.

Sequential reads can be done in much the same manner by reading successive bytes after each acknowledge without generating a stop condition. See Figure 7. The device automatically increments the word offset value (8-bit value) and with wraparound in the same segment 00h to read maximum of 256 bytes.

Figure 6. Random Access Read (Segment 00h only)

Figure 7. Sequential Read (Segment 00h only)

Figure 8. Byte Write (Segment 00h only)

Figure 9. Page Write (Segment 00h only)

The segment pointer is at the address 60h and is write-only. This means that a memory access at 61h will give undefined results. The segment pointer is a volatile register. The device configuration register at 62/63 (hex) is a non-volatile register. The configuration register will be shipped in the erased (set to FFh) state.

The segment pointer is used to expand the available DDC address space while maintaining backward compatibility with older DDC interfaces such as DDC2B. For each value of the 8-bit segment pointer one segment (256 bytes) is available at the A0/A1 pair. The standard DDC 8-bit address is sufficient to address each of the 256 bytes within a

segment. Note that if the segment pointer is set to 00h then the device will behave like a standard DDC2B EEPROM.

Read and write with segment pointer can expand the addressable memory to 512 bytes in each bank with wraparound to the next segment in the same bank only. The two banks can be individually selected by the configuration register and EDID Sel pin, as shown in Table 10. The segments are selected by the two bits $S_1S_0 = 00$ or 01 in the segment address.

Figures 10 to 13 show the random read, sequential read, byte write and page write.

Figure 10. Random Access Read

Figure 12. Byte Write

Figure 13. Page Write

CAT24C208

DSP Interface

The DSP interface is similar to I²C bus serial interface. Without the segment pointer, the maximum accessible memory space is 256 bytes of segment 00h only. In the

sequential mode the wrap around will be in the same segment also. Figures 14 to 17 show the read and write on the DSP Port.

Figure 21. Page Write

Arbitration

The device performs a simplistic arbitration between the DDC and DSP ports. While the arbitration scheme described is not foolproof, it does prevent most errors.

Arbitration logic within the device monitors activity on DDC_SCL and DSP_SCL. When both I²C ports are idle, DDC_SCL and DSP_SCL are both high and the arbitration logic is inactive. When a START condition is detected on

either port, the opposite port SCL line is pulled low, holding off activity on that port. When the initiating SCL line has remained high for one full second, the arbitration logic assumes that the initiating device is finished and releases the other SCL line. If the non-initiating device has been waiting for access, it can now read or write the device.

Table 9. CONFIGURATION REGISTER

| Register Function | MSB | | | | | | | LSB |
|------------------------|-----|---|---|---|----|-----|-----|-----|
