## Monolithic Linear IC BTSC Decoder for US TV

### Overview

The LA72702NV is a US TV BTSC Decoder.

### Features

- With SIF circuit, alignment-free\* STEREO channel separation.
- \* When base band signal input, separation is adjusted by input level.
- Dual slave address(80h, 84h).

### Functions

- SIF FM-Demodulator
- STEREO detection
- STEREO decoder
- STEREO detection sensitivity change function
- dbx Noise Reduction
- SAP demodulator
- SAP detection
- SAP output select 2-levels
- SAP detection sensitivity change function

### Specifications

#### Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum power supply voltage	V <sub>CC</sub> H max		7.0	V
Allowable power dissipation	Pd max	Ta ≤ 85°C, Mounted on a specified board*	290	mW
Operating temperature	Topr		-20 to +85	°C
Storage temperature	Tstg		-55 to +150	°C

\* Mounted on a specified board: 114.3mm×76.1mm×1.6mm, glass epoxy board

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

#### Operating Conditions at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Recommended operating voltage	vacate		5.0	V
Allowable operating voltage range	V <sub>CC</sub> H op		4.5 to 5.5	V

# LA72702NV

## I<sup>2</sup>C BUS Serial Interface Specification

### (1) Data transfer manual

This IC adopts control method (I<sup>2</sup>C-BUS) with serial data, and controlled by two terminals which called SCL (serial clock) and SDA (serial data). At first, set up <sup>\*1</sup> the condition of starting data transfer, and after that, input 8 bit data to SDA terminal with synchronized SCL terminal clock. The order of transferring is first, MSB (the Most Scale of Bit), and save the order. The 9th bit takes ACK (Acknowledge) period, during SCL terminal takes 'H', this IC pull down the SDA terminal. After transferred the necessary data, two terminals lead to set up and of <sup>\*2</sup> data transfer stop condition, thus the transfer comes to close.

\*1 Defined by SCL rise down SDA during 'H' period.

\*2 Defined by SCL rise up SDA during 'H' period.

### (2) Transfer data format

After transfer start condition, transfers slave address (1000 000\*) to SDA terminal, control data, then, stop condition (See figure 1).

Slave address is made up of 7bits, <sup>\*3</sup>8th bit shows the direction of transferring data, if it is 'L' takes write mode (As this IC side, this is input operation mode), and in case of 'H' reading mode (As this IC side, this is output operation mode). Data works with all of bit, transfer the stop condition before stop 8bit transfer, and to stop transfer, it will be canceled the transfer dates.

\*3 It is called R/W bit.

Fig.1 DATA STRUCTURE "WRITE" mode

Fig.2 DATA STRUCTURE "READ" mode

\* The output data synchronizes with the clock of SCL pin. Then, the ACK output is made after the output data.

bit8 is result of STERO DET (H : STEREO)

bit7 is result of SAP DET (H : SAP)

bit6 to bit1 are fixed to 'L'

### (3) Initialize

This IC is initialized for circuit protection. Initial condition is "0 (All bits)".
