

NE57810TK

Advanced DDR memory termination power with external reference voltage in

Rev. 5 — 9 January 2013

Product data sheet

1. Introduction

The NE57810TK is designed to provide power for termination of a Double Data Rate (DDR) SDRAM memory bus. It significantly reduces parts count, board space, and overall system cost compared to previous solutions.

2. General description

The NE57810TK DDR termination regulator maintains an output voltage (DDR reference bus voltage) that is half the RAM supply voltage. It is capable of providing up to ± 3.5 A for sustained periods. Overcurrent limiting protects the NE57810TK from inrush currents at start-up. Overtemperature shutdown protects the device in extreme temperature situations.

The package is thermally robust for flexibility of thermal design. The NE57810TK is a linear regulator so no external inductors or switching FETs are necessary. Fast response to load changes reduces the need for output capacitors.

3. Features and benefits

- Fast transient response time
- Overtemperature protection
- Overcurrent protection
- Commercial (0 °C to +70 °C) temperature range
- Reduced need for external components (switching FETs, inductors, decoupling capacitors)
- Internal divider maintains termination voltage at half the memory supply voltage
- Reference out for other memory and control components
- Optional external voltage reference in for flexible application
- Compatible with DDR-I ($V_{DD} = 2.5$ V) or DDR-II ($V_{DD} = 1.8$ V) SDRAM systems

4. Applications

- Desktop microcomputer systems
- Workstations
- Servers
- Game machines
- Set top boxes
- Embedded systems

■ Digital video recorders

GND	6	ground
GND	7	ground
GND	8	ground
GND	9	ground
GND	10	ground

[1] The thermal pad on the rear of the device (shown by dotted outline) is connected electrically to V_{SS} internally and provides enhancement to thermal conductivity. It should not be used as the primary connection to ground as device specifications indicate the use of the V_{SS} pin for this purpose.

8. Application design-in information

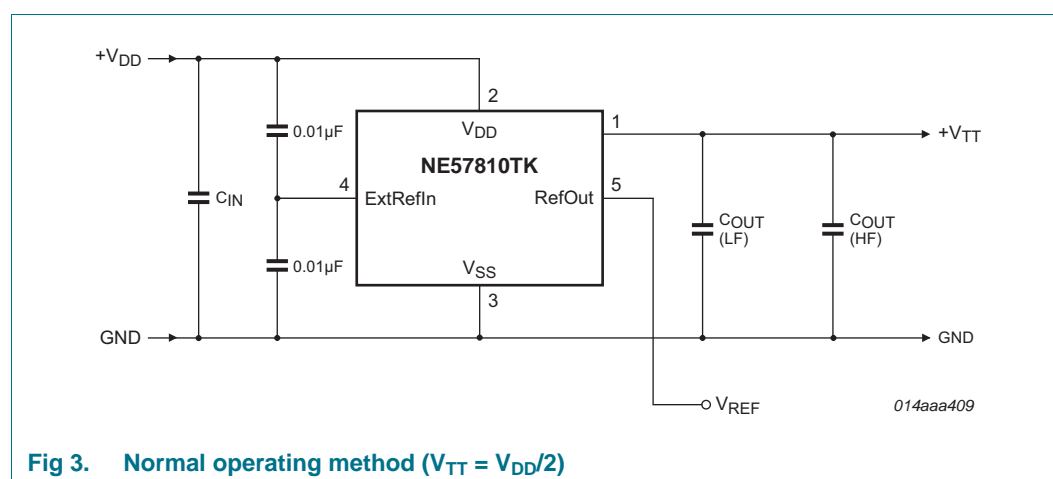

The NE57810TK can be used in a variety of DDR memory configurations. Its small footprint, fast transient response and reduced need for large bulk output capacitance, makes it highly adaptable. Some of examples methods of use are described in the following sections.

8.1 Normal operating mode ($V_{TT} = V_{DD}/2$)

The most common implementation of a DDR terminator regulator using the NE57810TK is shown in [Figure 3](#). The NE57810TK has an internal resistor divider between the V_{DD} (pin 2) and V_{SS} (pin 3) pins which maintains the output voltage, V_{TT} , at $V_{DD}/2$.

Typically, the V_{DD} voltage is the DDR RAM supply voltage, which can range from 1.8 V to 2.5 V. The center node of this resistor divider is connected to ExtRefIn (pin 4). This node acts as the reference for the V_{TT} output voltage and the buffered RefOut signal (pin 5).

If the ExtRefIn pin is not connected to other voltage sources, two small bypass capacitors (0.01 μF) should be placed between the ExtRefIn pin and the V_{SS} and V_{DD} pins to improve the terminator's noise performance. These two capacitors improve enable the terminator to better track any variations in the memory V_{DD} voltage. This method can be seen in [Figure 3](#).

There are two components to the memory signal load: a high frequency component caused by the 266 MHz plus speed of the address, data and control buses, and a low frequency component caused by the time-average skew of all of the bus states away from an equal number of 1s and 0s. Electrolytic and tantalum capacitors show inductance at the high frequencies, so two types of capacitors are required for output filtering.

A very good, low ESR bulk electrolytic capacitor of no less than 470 μF should be placed next to the terminator which, in turn, should be placed as close as possible to the memory array. Multiple high frequency ceramic filter capacitors are also needed for high speed transient filtering and output stability. These capacitors may be from V_{TT} to V_{SS} (shown in the diagrams) or one half from V_{TT} to V_{DD} and the other half from V_{TT} to V_{SS} so the output will better track any variations in the V_{DD} voltage.

For different memory sizes, the values of the recommended output filter capacitances will change. For a 256 MB memory space, for example, approximately 100 μF of ceramic surface mount chip capacitors should be evenly distributed across the physical memory layout. Depending upon the PCB noise environment, this can be 10 pieces of 10 μF , 20 pieces of 5 μF , and so on.

8.2 Externally programmed V_{TT} output voltage

The NE57810TK enables use of an external reference voltage to set its V_{TT} output voltage. This pin (ExtRefIn pin 4) is used for applications where the V_{TT} voltage is not V_{DD} divided by 2. This allows V_{TT} voltage and current to be drawn from a power supply bus that is not the DDR RAM supply voltage. This has some advantages when you are attempting to better match the power being drawn from the outputs emerging from the main system power supply. This can be seen in [Figure 4](#).

The internal reference voltage is set by two matched 100 k Ω resistors connected in a resistor divider between the V_{DD} and V_{SS} pins of the NE57810TK

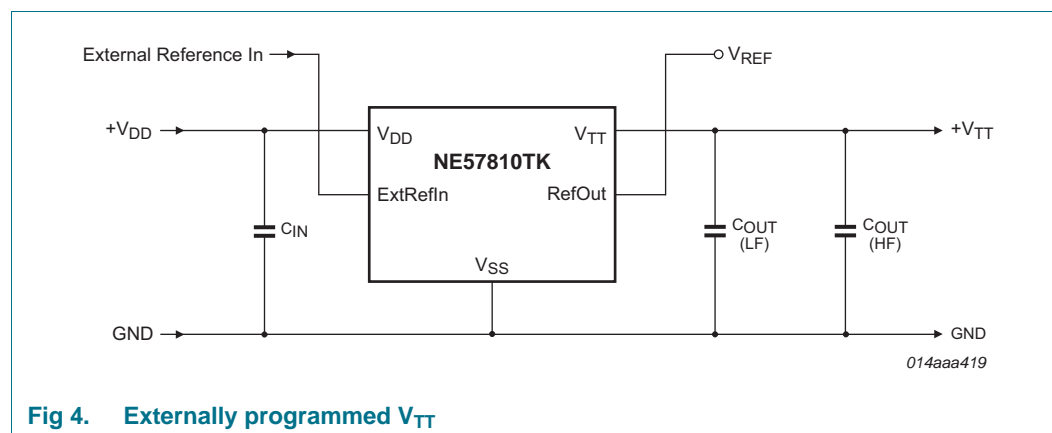

Fig 4. Externally programmed V_{TT}

8.3 Cascading the NE57810TK

For high-performance computer systems, sometimes memory banks are driven 180 degrees out of phase with one another in such a way that the apparent access time is halved (even and odd memory addresses). To do this, NXP recommends that two NE57810TKs are used, one to terminate each memory bank.

Cascading NE57810TK terminators offers two advantages, it improves the system noise performance by bringing the memory SIMMs closer to the terminator, and it distributes any heat generated by the terminator system. By using the RefOut pin from one NE57810TK to the ExtRefIn pin for the other NE57810TK(s) used in the system, one can always guarantee that the V_{TT} voltages are identical.

Because of the very tight output voltage regulation of the NE57810TK, the V_{TT} outputs should never be wired together. This is because the terminators would 'fight' one another if their output were different by only a few millivolts. This method can be used in either the normal operating mode and the externally programmed operating mode. This method of use can be seen in [Figure 5](#).

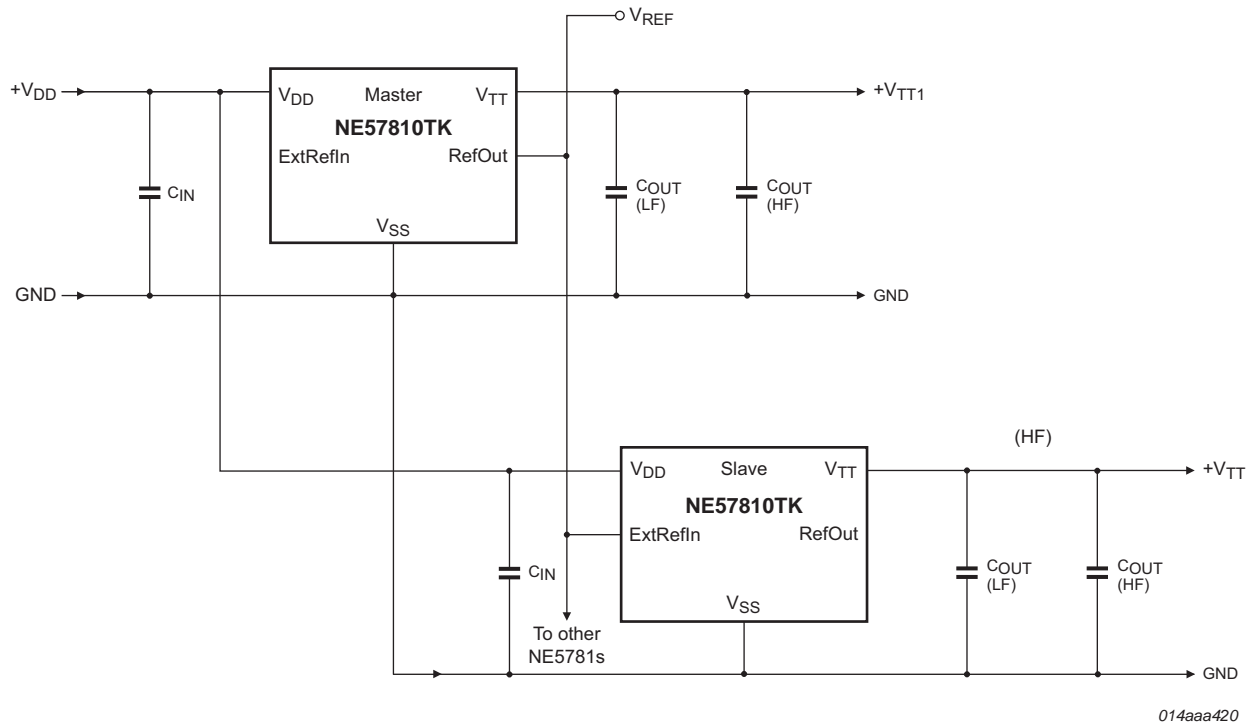

Fig 5. Cascading terminator systems for complex memory systems

9. Technical description

The NE57810TK supplies power to the DDR memory bus termination resistors at nominally half the voltage supplied to the memory ICs or DIMMs. DDR memory output drivers source and sink current into and out of their outputs.

A typical DDR memory system is seen in [Figure 1](#). Each input/output pin on the bus has a series 20 Ω resistor connected to it. The bus is terminated to the DDR terminator through a 27 Ω to 50 Ω resistance. The memory system then requires current from the V_{TT} terminator bus only when the instantaneous values of the aggregate bus state are not equal amounts of 1s and 0s.

When memory bus speeds are in the 200 MHz to 300 MHz region, the period of any single bus state is extremely small. This permits the DDR bus termination regulator to be a linear power operational amplifier that can source and sink current instantly to the DDR bus from the V_{DD} supply voltage.

[Figure 7](#) models the V_{TT} loading condition of each bus line equivalent circuit during operation and with terminating resistors.

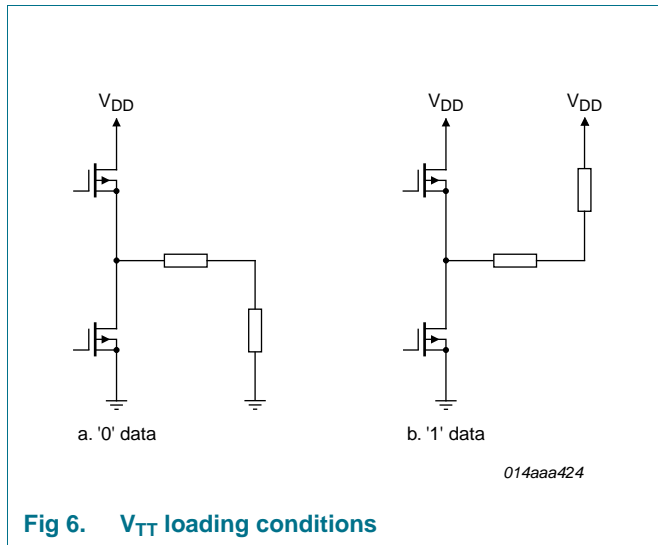

Fig 6. V_{TT} loading conditions

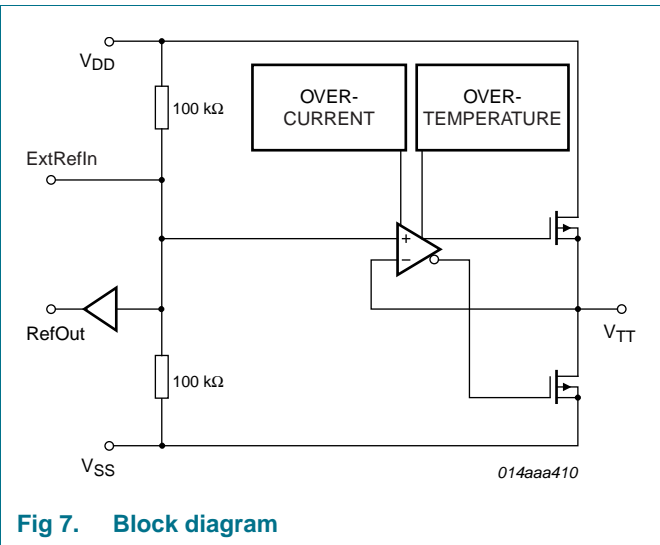

Fig 7. Block diagram

This yields the worst case current loading [Equation 1](#):

$$I_{O(max)} = \frac{N_{DDR} V_{DD}}{2(R_T + R_S)} \quad (1)$$

Where:

- N_{DDR} is the total number of terminated control, address and data lines within the DDR memory system. (typically 192).
- R_T is the value of the terminating resistors.
- R_S is the value of the series resistors from the active output driver.

Hence the worst case current loading condition, where there are either all 1s or all 0s for an instant, and R_T is 27 Ω and R_S is 20 Ω , produces an instantaneous output current of either +3.5 A or -3.5 A.

10. Thermal design

Designing the proper thermal system for the NE57810TK is important for its reliable operation. The NE57810TK will be operating at an average power level less than the maximum rating of the part. In a typical DDR terminator system the average power dissipation is between 0.8 W and 1.5 W.

The termination power will vary as the average number of 1s and 0s changes during normal operation of the DDR memory. The load current will assume a new value for each bus cycle at a 266 MHz rate, and will increase and decrease as the statistical average of bus states change.

The terminator heat sink must be designed to accommodate the average power as a steady state condition and be able to withstand momentary periods of increased dissipation, typically 2 seconds to 5 seconds duration. For the typical NE57810TK application, the power dissipated by the terminator can be calculated by [Equation 2](#):

$$P_D = I_{DD} \times V_{TT} W \quad (2)$$

The thermal resistance of a surface mount package is given as $R_{th(j-a)}$, the thermal resistance from the junction to air. JEDEC51-7 specifies a 4-layer multilayer PCB (2 oz/1 oz/1 oz/2 oz copper) that is 4 inches on each side.

This is probably the best (or lowest) thermal resistance you will see in any application. Most applications cannot afford the PCB area to create this situation, but the thermal performance of a multilayer PCB will still provide a significant heatsinking effect. The actual thermal resistance will be higher than the 18.7 °C/W given for the 4-layer JEDEC PCB.

Figure 8 shows the thermal resistance you can expect for heatsinking PCB areas less than the JEDEC specification. The graph is for a 2 oz single-sided PCB with a square area of the side dimension as given on the X-axis. If you use a double-sided PCB with some plated-through holes to help transfer heat to the bottom side, the thermal resistance only improves by about 3 °C/W to 4 °C/W.

Fig 8. PCB heat sink area versus thermal resistance

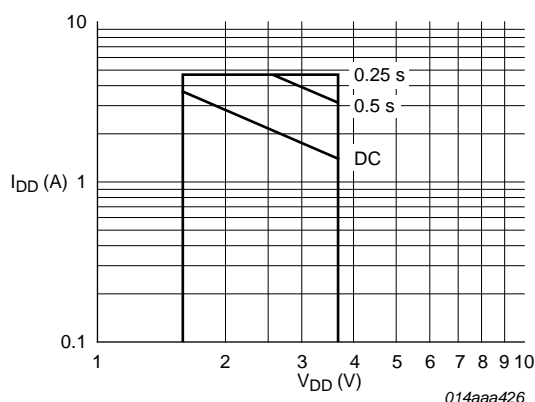

Fig 9. Safe operating area for the NE57810TK

After the power is estimated, the minimum PCB area can be determined by calculating the worst case thermal resistance and, based on Figure 8, determine the PCB area. This is done by Equation 3:

$$R_{qJA(min)} = \frac{T_j - T_{amb}}{P_D} \quad (3)$$

Where:

- T_j is the maximum desired junction temperature.
- T_{amb} is the highest expected local ambient temperature.
- P_D is the estimated average power

The junction temperature should be kept well away from the overtemperature cut-off threshold temperature (+150 °C) in normal operation. Using the above power dissipation, the highest ambient temperature and a junction temperature of +125 °C, calculate the maximum thermal resistance using Equation 4, (1.5 W is used only as an example).

$$R_{th(j-a)(min)} = \frac{125^\circ C - 70^\circ C}{1.5 W} = 36.6^\circ C/W \quad (4)$$

Looking at [Figure 8](#), you see that this power dissipation requires a minimum PCB island area of 225 mm² (15 mm on each side). This is the smallest area you could use at this power dissipation. Of course, increasing this area will allow the NE57810TK to operate at cooler temperatures, thus enhancing its long-term reliability.

11. Limiting values

Table 3. Limiting values

In accordance with the Absolute Maximum Rating System (IEC 60134).

Symbol	Parameter	Conditions	Min	Max	Unit
V _{DD}	supply voltage	V _{DD} to V _{SS} voltage	−0.3	+3.6	V
T _{amb}	ambient temperature		0	+70	°C
T _{stg}	storage temperature		−40	+165	°C
T _j	junction temperature		-	160	°C
P _D	power dissipation	[1]	-	3.3	W

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

18.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

18.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond

NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
