## Proximity

# A Global Leader in Industrial Automation

Turck's sensors, connectivity, and fieldbus technology products are built to be the best. As one of the most **prominent** sensor manufacturers **in the world**, we even back our sensors with a **lifetime warranty**. Turck works by bringing **rugged engineering** solutions to your industrial automation applications.

**85,000+**  
SOLUTIONS

**50+**  
YEARS OF INNOVATION

**2,000+**  
EXPERIENCED SALES REPRESENTATIVES

Pioneer in non-contact  
**sensing** technology

Developed innovative **connectivity**  
solutions in response to our customers' needs

Recognized the need for advanced **I/O solutions**  
in harsh duty environments

**SUPPORT &  
DEDICATED SERVICE**

**EXTENSIVE WARRANTY**

 **4,000+**  
APPLICATION EXPERTS

RESPOND  
and SOLVE **over 1,200** inquiries  
per day

Strategically placed manufacturing facilities in the

**USA** with **28** GLOBAL  
SUBSIDIARIES

**GLOBAL BUT LOCAL...**

# Innovative Sensing Solutions

At Turck, we understand that every application is unique, which is why we dedicate ourselves to finding the optimal engineered solution for all applications. Whether you need a sensor, cordset, or network I/O, Turck's range of innovative manufacturing capabilities and engineering expertise allows us to work beyond the scope of our competitors. We utilize the most up-to-date manufacturing processes, including EDM, molding, and laser trimming, ensuring that our products not only survive, but thrive in the harshest of conditions.

## Complimentary Sensor Audits

We consider it our job to help our customers decrease failures and reduce operation downtime, which is why we offer a complimentary audit program. The audit helps to identify, evaluate, and solve problem areas where sensors and cordsets are continually damaged or destroyed. This reduction in downtime will reduce your costs and ensure you get the most value out of your production processes.

## Lifetime Warranty

We have the utmost confidence in our products, and you should, too! Solutions from Turck are not only built to work, but built to last. All of our products come with extensive warranties, and many of our sensors have an optional lifetime warranty against sensor failure, so you can rest easy knowing that you have invested in a dependable solution.

## GLOBAL LEADERS

PROVIDING CUSTOMERS WITH SENSING SOLUTIONS

- Sensing ranges from .08 – 100 mm
- Overmolds
- Custom designed sensor housings
- Pigtails / Mold-ons
- Mating cordsets
- Free software and support
- Wide range of accessories
- Kitting

## MATERIALS

BUILT TO LAST IN THE HARSHTEST ENVIRONMENTS

- Stainless steel
- Overmolds
- Viton
- PUR/TPU/TPE
- Armored Cable
- PTFE and Weldguard coating
- FDA Approved Washdown

### SHIPPING

#### SHIP ONE-TO-ONE MILLION, WITH NO LIMIT

We understand that some applications require less parts, which is why we offer flexible minimum orders to ensure you only receive the number of parts you need.

### TESTING

#### OUR PRODUCTS UNDERGO EXTENSIVE TESTING

To continuously deliver solutions of only the highest quality, Turck products undergo a rigorous set of tests. These tests are in accordance to national and international standards, such as IEC and UL. Our products meet and exceed industry standards, ensuring their survivability and dependability in all applications.

### INVENTORY

#### USE TURCK'S VAST NETWORK OF DISTRIBUTORS, OR...

Get immediate access to your Turck products with your own on-site Turck vending machine. Convenient access to your most used products can help save money and reduce downtime.

# Rectangular Inductive Sensor Part Number Key

**B** **i** **15** - **Q** **20** - **A** **P** **6** **X2** **Wiring Option\*** **Special Option Code\*\***

**Mounting**

- B = embeddable
- N = nonembeddable

**Principle of Operation**

- i = inductive

**Rated Operating Distance (mm)**

**Sensing Characteristics**

- S = side sensing on Q10S sensor
- U = Uprox® Sensor

**Housing Style**

**Rectangular**

- K = smooth
- Q = metal or plastic, various rectangular styles

**Limit Switch**

- CA = Stubby®, short aluminum housing, connector
- CK = Stubby, short plastic housing, connector
- CP = Combiprox®, plastic housing, terminal chamber base with removable sensor

**Housing Height (mm)**

**Number of LEDs**

- (blank) = no LEDs
- X = 1 LED
- X2 = 2 LEDs

**Voltage Range**

**AC/DC: (No SCP)\*\***

- 3 = 20-250 VAC, 10-300 VDC
- 31 = 20-250 VAC, 10-300 VDC, plastic barrel

**AC/DC: (Latched SCP)**

- 30 = 20-250 VAC, 10-300 VDC 400 mA
- 32 = 20-250 VAC, 10-300 VDC 400 mA

**DC:**

- 4 = 10-65 VDC, polarity protected, pulsed SCP\*\*
- 6 = 10-30 VDC, polarity protected, pulsed SCP

\*\*SCP = short-circuit and overload protection

**Output**

- D = 2-wire DC (transistor output)
- DZ = 2-wire AC/DC, (power MOSFET output)
- N = NPN transistor (current sinking)
- P = PNP transistor (current sourcing)
- Z = 2-wire AC or 2-wire AC/DC

**Output Function**

- A = normally open (N.O.)
- F = connection programmable (N.O. or N.C.)
- V = complementary outputs: one N.O., one N.C.
- Y0 = NAMUR output, requires switching amplifier
- Y1 = NAMUR output, requires switching amplifier/ATEX approved

**Secondary Housing Modifier**

- SR = straight terminal chamber

**NOTE:**

Part number keys are to assist in identification only.  
Verify new part numbers with factory; some configurations are not possible.

We reserve the right to make technical alterations without prior notice.

Rectangular Inductive Sensors

**Wiring Options\***

**A. Connectorized Sensor**

**Bi15 - Q20 - AN6X2 - H1 1 4 1**

**Connector Family**

- B1 = Minifast®, Metal, Male
- B2 = Minifast, Plastic, Male
- B3 = Microfast®, Metal, Male
- H1 = Eurofast®, Metal or Plastic, Male
- V1 = Picofast®, Metal, Male
- V2 = Picofast, Snap and M8x1, Male (Q08 Only)

**Connector/Sensor Transition**

- 1 = straight

**Wiring Configuration**

**Example:**

- 1 = Standard
- 3 = N.C. DC Output on Pin 4 (for US)

**Number of Pins**

**B. Potted Cable**

**Bi15 - Q20 - AN6X2 - 7M**

**Cable Length**

- Blank = 2 meter cable
- 7M = 7 meter cable

**Special Option Codes\*\***

**Bi - 5 - Q08 - AN6XS /S34**

**Option Code**

**Example:**

- /S34 = Weld Field Immune
- /S97 = -40 °C (-40 °F) Operating Temperature
- /S100 = +100 °C (+212 °F) Operating Temperature
- /S1590 = CK/CA40 sensors with Weldguard laminate
- /S1591 = CA40 sensors with Weldguard and Armorguard

# Rectangular Inductive Sensors

## Mounting

Turck inductive proximity sensors are manufactured with a shielded coil, designated by “Bi” in the part number, and a nonshielded coil, designated by “Ni” in the part number (see page A2). Embeddable (shielded) units may be safely flush-mounted in metal. Nonembeddable (nonshielded) units require a metal free area around the sensing face. Because of possible interference of the electromagnetic fields generated by the oscillators, minimum spacing is required between adjacent or opposing sensors.

It is good engineering practice to mount sensors horizontally or with the sensing face looking down. Avoid sensors that look up wherever possible, especially if metal filings and chips are present.

## Embeddable Mounting Characteristics - Rectangular Housings

### Flush Mountable - CK40 and CP40

Housing Type	Sensor Type	A	B	C	D	E
CP40/CK40	Bi15U	45.00	80.00	40.00	40.00	90.00
CP40/CK40	Bi15	45.00	80.00	40.00	40.00	90.00
CP40/CK40/CA40	Bi20U	60.00	80.00	40.00	40.00	120.00
CP40	Bi20	60.00	80.00	40.00	40.00	120.00
CP40/CK40	Bi30U	90.00	80.00	40.00	40.00	180.00

Dimensions are in mm.

We reserve the right to make technical alterations without prior notice.

# Rectangular Inductive Sensors

## Nonembeddable Mounting Characteristics - Rectangular Housings

### Non - Flush Mountable - CA25, CK40, and CP40

Housing Type	Sensor Type	A	B	C	D	E	F	1-Side	2-Side	3-Side	4-Side
CP/CK40	Ni20	60.00	120.00	60.00	40.00	120.00	20.00				
CP/CK40	Ni25U	75.00	240.00	60.00	40.00	150.00	30.00	Sr=22 mm*	Sr=20 mm*	Sr=17 mm*	Sr=13 mm*
CP/CK40	Ni25	75.00	120.00	60.00	40.00	150.00	40.00				
CP/CK40	Ni35U	105.00	240.00	60.00	40.00	210.00	30.00	Sr=28 mm*	Sr=24 mm*	Sr=19 mm*	
CP/CK40	Ni35	105.00	180.00	60.00	40.00	210.00	40.00				
CP/CK40	Ni40U	120.00	240.00	60.00	40.00	240.00	30.00				
CP/CK40	Ni40	120.00	180.00	60.00	40.00	240.00	40.00				
CP/CK40	Ni50U	105.00	240.00	60.00	40.00	240.00	30.00	Sr=35 mm*	Sr=25 mm*	Sr=20 mm*	Sr=15 mm*

Dimensions are in mm.

\*Uprox Non-embeddable flush mounting guidelines. The above Uprox Ni sensors with DC outputs can be flush mounted because the sensor automatically compensates for metal alongside its sensing face by decreasing the sensing range, preventing the output from locking on.

We reserve the right to make technical alterations without prior notice.

## A1 2-wire DC NAMUR - (Y0 and Y1)

Differential Travel (Hysteresis):	1-10% (5% typical)
Nominal Voltage:	8.2 VDC (EN60947-5-6)
Load Resistance:	1000 Ω
Non-activated Current Consumption:	≥2.1 mA
Activated Current Consumption:	≤1.2 mA
Recommended Switching Point for Remote Amplifier:	>1.2 to <2.1 mA, typ. 1.55 mA ON/1.75 mA OFF

Power-On Effect:	Realized in Amplifier
Reverse Polarity Protection:	Incorporated
Wire-Break Protection:	Realized in Amplifier
Transient Protection:	Realized in Amplifier
Shock:	30 g, 11 ms
Vibration:	55 Hz, 1 mm Amplitude in all 3 Planes
Repeatability:	≤2% of Rated Operating Distance

### Amplifier Note:

Inductive sensors with Namur outputs are typically used in hazardous locations and the approval agencies require the use of an amplifier to regulate the signals in the hazardous area. Due to the wide variety of approvals, output options, and amplifier designs, it is not possible to incorporate all of the choices in this catalog. For the most up to date information, please either search for these products under our interface technology product category ([www.turck.us](http://www.turck.us)) or contact us by phone.

We reserve the right to make technical alterations without prior notice.

Inductive Barrel Sensors

# Inductive Barrel Sensor Part Number Key

## Wiring Options\*

### A. Connectorized Sensor

Bi2-M12-AN6X - H1 1 4 1

#### Connector Family

- B1 = Minifast®, 7/8"-16UN, metal, male
- B2 = Minifast®, 7/8"-16UN, plastic, male
- B3 = Microfast®, 1/2"-20UNF, metal, male
- H1 = Eurofast®, M12x1, metal or plastic, male
- V1 = Picofast®, snap and M8x1, metal, male (Q08 snap only)
- V2 = Picofast®, snap and M8x1, male (Q08 only)

#### Connector/Sensor Transition

- 1 = straight
- 3 = straight with adapter
- 4 = right-angle with adapter

#### Factory Code

##### Example:

- 0 = non-standard wiring
- 1 = standard wiring
- 3 = N.C. DC output on pin 4
- 4 = N.O. 2-wire DC output on pin 4

#### Number of Pins

### B. Potted Cable

Bi2-G12-AN6X 7M

#### Cable Length

- (blank) = 2 meter cable
- 7M = 7 meter cable
- \*M = custom cable lengths available

### C. Potted Cable with Molded Connector

Bi2-G12-Y0X - 0.2M - RS 4.21T

#### Cable Length

##### examples:

- 0.2M = 0.2 meters (minimum)
- 2M = 2 meter cable
- 7M = 7 meter cable

#### Standard Cordset Connector

- AC: RSM 30 = Minifast, 7/8"-16UN, metal, male, 3-conductor
- SB 3T = Microfast, 1/2"-20UNF, metal, male, 30 conductor
- DC: RS 4T = Eurofast, M12x1, metal or plastic, male, 3-conductor
- RS 4.2T = Eurofast, M12x1, metal or plastic, male, 2-conductor
- RS 4.21T = Eurofast, M12x1, metal or plastic, male, NAMUR, 2-conductor
- RS 4.4T = Eurofast, M12x1, metal or plastic, male, 4-conductor
- RSM 40 = Minifast, 7/8"-16UN, metal, male, 4-conductor
- PSG 3 = Picofast, snap, plastic, male, 3-conductor
- PSG 3M = Picofast, M8x1, male, 3-conductor

## Option Codes for Special or Custom-Built Sensors\*\*

Bi 2-S12-AN7X /S100 or Bi10-M30-AN6X-H1141 /F2

#### examples:

- /S34 = weld field immune
- /S90 = TPU cable
- /S97 = -40 °C (-40 °F) operating temperature
- /S100 = +100 °C (+212 °F) operating temperature
- /S1589 = barrel sensors with Weldguard® laminate
- /S1610 = barrel sensors with tool steel sleeve and Weldguard® laminate

#### example:

- /F2 = alternate oscillator frequency

We reserve the right to make technical alterations without prior notice.

## Inductive Barrel Sensors

### Mounting

Turck inductive proximity sensors are manufactured with a shielded coil, designated by “Bi” in the part number, and a nonshielded coil, designated by “Ni” in the part number. Embeddable (shielded) units may be safely flush-mounted in metal. Nonembeddable (nonshielded) units require a metal free area around the sensing face. Because of possible interference of the electromagnetic fields generated by the oscillators, minimum spacing is required between adjacent or opposing sensors.

It is good engineering practice to mount sensors horizontally or with the sensing face looking down. Avoid sensors that look up wherever considered, especially if metal filings and chips are present.

### Maximum Locknut Torque Specifications

The locknut torque should be considered for all threaded sensors to prevent the housing from being over stressed. The values below pertain to the locknut provided with each sensor. Liquid thread sealants of an anaerobic base, such as Loctite, are recommended if strong vibrations are likely.

**Caution:** Sensor barrels are typically brass. Consider break torque when selecting grade of thread sealant.

Barrel Size	Metal Barrel	Plastic Barrel
5 mm	5 Nm (3.7 ft-lb)	----
8 mm	5 Nm (3.7 ft-lb)	----
8 mm (M08 Ferrite)	7 Nm (5.2 ft-lb)	----
12 mm	10 Nm (7.4 ft-lb)	1 Nm (0.7 ft-lb)
18 mm	25 Nm (18 ft-lb)	2 Nm (1.4 ft-lb)
30 mm	75 Nm (55 ft-lb)	5 Nm (3.7 ft-lb)
47 mm	90 Nm (66 ft-lb)	----

### Drill Hole Sizes for Metric Threads

Thread Size	Pitch	Thru Hole (mm)	Tap Hole Dia. (mm)	Thru Hole (in)	Tap Hole Dia. (in)
M5 x 0.5	0.5	5.0	4.5	13/64	5/32
M8 x 1	1.0	8.0	7	21/64	1/4
M12 x 1	1.0	12.0	11	31/64	13/32
M18 x 1	1.0	18.0	17	23/32	41/64
M30 x 1.5	1.5	30.0	28	1-3/16	1-5/64
PG 9	1.41	15.2	14	5/8	1/2
PG 13.5	1.41	20.4	19	13/16	23/32
PG 36	1.59	47.0	45.5	1-7/8	1-47/64

Ni40	47.00	120.00	141.00	71.00	141.00	240.00	40.00			

Dimensions are in mm.

\* The above Uprox Ni sensors with DC outputs and Stainless barrels can be flush mounted because the sensor automatically compensates for metal alongside its sensing face by decreasing the sensing range, preventing the output from locking on.

### Amplifier Note:

Inductive sensors with Namur outputs are typically used in hazardous locations and the approval agencies require the use of an amplifier to regulate the signals in the hazardous area. Due to the wide variety of approvals, output options, and amplifier designs, it is not possible to incorporate all of the choices in this catalog. For the most up to date information, please either search for these products under our interface technology product category ([www.turck.us](http://www.turck.us)) or contact us by phone.

### Amplifier Note:

Inductive sensors with Namur outputs are typically used in hazardous locations and the approval agencies require the use of an amplifier to regulate the signals in the hazardous area. Due to the wide variety of approvals, output options, and amplifier designs, it is not possible to incorporate all of the choices in this catalog. For the most up to date information, please either search for these products under our interface technology product category ([www.turck.us](http://www.turck.us)) or contact us by phone.

## Wiring Options\*

### A. Connectorized Sensor

Bi2 - M12 - AN6X2 - **H1** **1** **4** **1**

#### Connector Family

- B1 = Minifast®, 7/8"-16UN, metal, male
- B2 = Minifast, 7/8"-16UN, plastic, male
- B3 = Microfast®, 1/2"-20UNF, metal, male
- H1 = Eurofast®, M12x1, metal or plastic, male
- V1 = Picofast®, snap and M8x1, metal, male (Q08 snap only)
- V2 = Picofast, snap and M8x1, male (Q08 only)

#### Connector/Sensor Transition

- 1 = straight
- 3 = straight with adapter
- 4 = right-angle with adapter

#### Wiring Configuration

##### Example:

- 0 = non-standard wiring
- 1 = standard wiring
- 3 = N.C. DC output on pin 4 (for US)
- 4 = N.O. 2-wire DC output on pin 4

#### Number of Pins

- 3 = 3
- 4 = 4
- 5 = 5

### B. Potted Cable

Bi2 - G12 - AN6X **7M**

#### Cable Length

- (blank) = 2 meter cable
- 7M = 7 meter cable
- \*M = custom cable lengths available

## Special Option Codes\*\*

Bi **2-S12-AN7X** /**S100** or Bi**10R-W30-DAN6X-H1141** /**F2**

#### Example:

- /S90 = TPU cable
- /S97 = -40 °C (-40 °F) operating temperature
- /S100 = +100 °C (+212 °F) operating temperature
- /S120 = +120 °C (+248 °F) operating temperature
- /S139 = submersible
- /S907 = +160 °C (+320 °F) operating temperature
- /S1009 = 250 ms internal off delay
- /S1102 = +250 °C (+482 °F) operating temperature
- /S1751 = approved for FM Class I, Div 2, groups A, B, C, and D

#### Example:

- /F2 = alternate oscillator frequency

Specialty Sensors

# Specialty Sensors

## Uprox+ Washdown Sensors

The Uprox+ Washdown product family is with a full line of inductive sensors that senses all metals at the same range (no correction factor), extended temperature rating from -40 to +100 °C, robust construction with IP68 and IP69k sealing ratings, and housing materials compatible with common acidic and alkaline chemicals used in Food and Beverage applications.

## Sensors with Extended Temperature Range

Turck offers sensors for applications that withstand extreme temperatures of -40 to +250 °C. Typically, these sensors are used in applications like cold storage facilities, metal foundries, glass making, outdoor applications, and in painting shops in the automotive industry.

## Stainless Steel Face Sensors

Inductive sensors with one piece stainless steel faced barrels are ideal for applications where physical impact is common or where ingress through the sensing face is a concern. The sensors are available in barrel diameters from 8 mm to 30 mm, standard and extended sensing ranges, rated IP68/IP69K, with optional coatings for welding environments, and 2 and 3-wire designs.

## Mobile Equipment Sensors

Position sensing applications in mobile equipment have different electrical requirements than what is common for industrial sensors. Turck designs and manufactures a diverse line of inductive sensors that meet or exceed the industry requirements for sealing (IP68/IP69K), load dump protection, resistance to shock, vibration, EMC immunity, extended temperature range, wide operating voltage, and extended sensing range.

## Inductive Sensor with 6 A Rated Output

This 30 mm mobile equipment sensor uses a MOSFET component to switch up to 6 amps of current with either a normally open output or a complementary normally open and closed output in a stainless steel housing. The sensor can be configured as an embeddable or nonembeddable sensor.

We reserve the right to make technical alterations without prior notice.

## Specialty Sensors

### FM Class I Div 2

The new FM approval standard permits the use of quick disconnect with a lock fast accessory equipped sensor being used in Class I Div 2, Groups A, B, C, D. The ability to use quick disconnect will enable users to install sensors faster and at a lower cost than traditional conduit methods. We also offer approved cordsets with Eurofast or Minifast connectors (when used with a Lokfast guard). All cables have the ITC-ER rating. For applications where conduit is preferred, we offer sensors with potted-in ITC rated cables.

### Inductive Ring Sensor

Turck offers a variety of ring sensor designs that detect a wide variety of target sizes, with sensor outputs to solve either static or dynamic part feeding applications. In addition to our six different ring sensor housings, Turck offers the TS12 Uprox®+ sensor, which senses all metals at the same range while functioning like a ring sensor but can be strapped onto a tube to simplify installation.

### Inductive Slot Sensors

Turck's slot sensors incorporate a U-shaped design with the active sensing face between the two arms. If the object being detected moves into the U-shaped area, the sensor is actuated. Slot sensors are capable of securely detecting targets whose distance from the active face is not clearly defined upon side approach.

### Weld Nut Sensors

Turck's magnetic weld nut sensors provide efficient and economical detection of weld nuts in automotive applications. The sensors detect ferromagnetic components, such as nuts, bushings and spacer sleeves, to ensure these components are present before robotic welding occurs. These sensors are less complex than existing devices that require additional software or electronics to detect the target.

### Can and Edge Detection Sensor

Turck's Q130 sensor is designed for easy mounting on metal can conveying systems to help detect jam ups or lack of metal cans in the conveyor, while the CK4080 and CK40130 sensors are optimized to detect the edges of metal sheets commonly used in transfer presses found in automotive or white goods stamping applications.

We reserve the right to make technical alterations without prior notice.

Specialty Sensors

# Specialty Sensors

## Inductive-Magnetic Proximity Sensors

Turck's line of BIM barrel sensors are designed to work with external magnets and can be used to solve a wide variety of sensing applications, especially where the user would like long sensing ranges (up to 90 mm with DMR31-15-5 magnet) in small housings, such as 8 or 12 mm.

## Submersible Inductive Sensors

These sensors are rated for submersion in water depths up to 500 meters. The materials used to construct this 18 mm diameter sensor are seawater resistant. Available in a variety of sensing ranges and outputs.

## Selective Metal Sensors

Standard inductive sensors sense all metals. Turck's family of selective metal inductive sensors offer a reliable solution for applications where the user wants to detect ferrous metals or non-ferrous metals only.

## In-Cylinder Inductive Sensors

These inductive sensors are designed for use in a hydraulic cylinder to detect extended or retracted positions. Available in M12 or M18 barrels, these sensors can withstand static pressures up to 7,250 psi.

## Rotational Speed Sensors

Rotational speed sensors are designed to work with a rotating metal target like a keyway or sprocket. These sensors feature a simple potentiometer for adjusting the set point and are ideal for monitoring applications where the user wants to monitor under speed or over speed conditions. If the speed is below the set point the output is off, and if the speed is above the set point the output turns on.

We reserve the right to make technical alterations without prior notice.

Specialty Sensors

Dimensions are in mm.

\* Do not use a metal mounting bracket.

\*\* Sensitivity adjustment does affect the recommended mounting spacing. Please consult factory for assistance when using multiple sensors.

\*\*\* Spacing of multiple sensors depends on the actual number and orientation. Please contact factory for assistance.

### Slot Sensor Mounting Characteristics

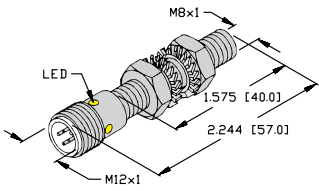

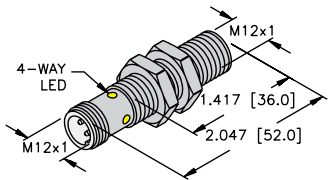

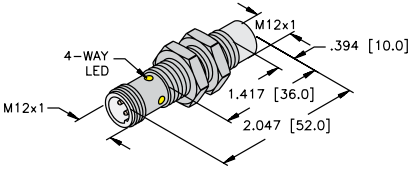

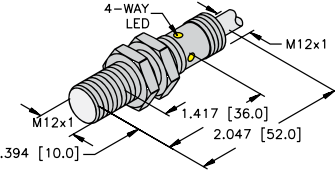

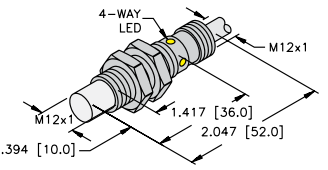

Sensor Type	A	B	C	D	E	F
Si3.5	15.00	5.00	15.00	0	0	0
Si5	10.00	0	5.00	0	0	0
Si15	30.00	10.00	30.00	5.00	5.00	5.00

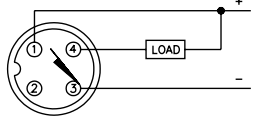

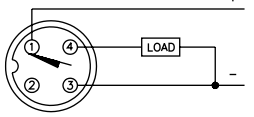

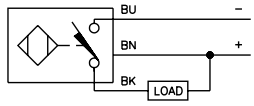

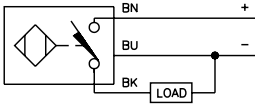

Dimensions are in mm.

### Features

- Load Dump Protection
- Shock Resistant
- EMC Immunity
- Extended Temperature Range
- Broader Operating Voltage
- Improved Sealing and Environmental Protection
- Longer Sensing Range

**Note:**  
 OS\* The optimal sensitive area for the 4.0 mm diameter probes has a width of 0.5 mm and is laser-engraved on the tip of the probe, 11.9 mm above the M12 thread.  
 S\*\* Sensitive area: Within this area the sensor signal changes when assembly parts are changed.  
 M\*\*\* Maximum area: The maximum signal intensity is reached if the sensitive area is completely covered.

Optional teach adapter available, part number VB2-SP1.

H1 = Eurofast®, M12x1, metal or plastic, male	1 = standard wiring
V1 = Picofast®, snap and M8x1, metal, male (Q08 snap only)	<b>Number of Pins</b>
<b>Connector/Sensor Transition</b>	
1 = straight	

### B. Potted Cable

<b>Bi 5 - M18 - LIU -</b>	<b>7M</b>	<b>Cable Length</b>
---------------------------	-----------	---------------------

Blank	= 2 Meter cable
7M	= 7 Meter cable

# Analog Sensors

## Common Applications for Linear Analog Sensors

	<p><b>Position Feeding Over an Angled Target</b></p> <ul style="list-style-type: none"> <li>• Actuation over an angled surface</li> <li>• Provide a 4-20 mA and/or 0-10 V output based upon target position</li> </ul>
	<p><b>Eccentricity Sensing or Absolute Angle Positioning</b></p> <ul style="list-style-type: none"> <li>• Sense pieces of different shapes and sizes (of ferritic or nonferritic materials)</li> <li>• Provide analog feedback on rotary cam position applications</li> </ul>
	<p><b>Direct Actuation</b></p> <ul style="list-style-type: none"> <li>• The highest accuracy is achieved if the sensor is directly actuated by the target. In order to utilize the full measuring range, it is important to work with an appropriately sized target. This may also be a moving part of the machine.</li> </ul>
	<p><b>Part Deflection</b></p> <ul style="list-style-type: none"> <li>• Tensile stress control applications</li> <li>• Measure the deflection of a metal target by using a guide mechanism and an analog sensor.</li> </ul>
	<p><b>Probe Style Analog+ Proximity Sensor</b></p> <ul style="list-style-type: none"> <li>• These sensors can be used to detect the depth of a blind hole or be used with a ring attached to a control arm that moves the ring over the probe</li> </ul>
	<p><b>Identification and Sorting of Small Parts</b></p> <ul style="list-style-type: none"> <li>• When screws, rivets, or other small objects fall through a ring style sensor, each part generates a characteristic output signal which can be easily identified</li> </ul>
	<p><b>Position Control</b></p> <ul style="list-style-type: none"> <li>• Position control can be easily accomplished by means of a cone shaped target. Measuring ranges can be adapted to specific sensing needs by using targets with an appropriate conical shape. These sensors enable precise and simple position detection, even if the targets feature a slight offset.</li> </ul>
	<p><b>Thickness Measurement</b></p> <ul style="list-style-type: none"> <li>• Detection and measurement of tools (drill bits, taps, etc.) can be accomplished to ensure proper size</li> </ul>

1

Mating Cordset: RK 4.4T-\*

A7

### 3 and 4-wire DC Analog - (LIU, SIU)

Ripple:	≤10%
No-Load Current:	≤8.0 mA
Load Resistance Voltage Output:	0-10 V/R <sub>L</sub> ≥4.7 kΩ
Load Resistance Current Output:	0-20 mA/R <sub>L</sub> ≤0.4 kΩ
Temperature Drift:	±0.06% / °C
LIU5:	4-20 mA, 0-10 V
LIU2:	4-20 mA, 2-10 V

Transient Protection:	Per EN 60947-5-2
Shock:	30 g, 11 ms
Vibration:	55 Hz, 1 mm Amplitude, in all 3 Planes
Repeatability:	≤1% of measuring range  A-B  (0.5% after 30 min. warm up)
Short-Circuit Protection:	Yes
Reverse Polarity Protection:	Incorporated

# Capacitive Sensor Part Number Key

**Mounting**

- B = embeddable
- N = nonembeddable

**Principle of Operation**

- C = capacitive
- CC = capacitive (low dielectric targets)
- CF = capacitive (noise immune)
- CT = capacitive teach

**Rated Operating Distance (mm)**

**Housing Style**

**Barrel - Metal**

- M = partial threading, chrome plated brass

**Barrel - Plastic**

- K = smooth
- KT = PVDF, smooth
- P = full threading
- PT = PVDF, full threading
- S = partial threading

**Rectangular**

- Q = metal or plastic, various rectangular styles
- QF = plastic, Polypropylene rectangular style

**Housing Diameter or Height (mm)**

**NOTE:**

Part Number Keys are to assist in identification only.  
Verify new part numbers with factory;  
Some configurations are not possible.

**Teach Button**

**Number of LEDs**

- (blank) = no LEDs
- X = 1 LED
- X2 = 2 LEDs

**Voltage Range**

**AC/DC: (No SCP\*\*)**

- 3 = 20-250 VAC

**DC:**

- 4 = 10-65 VAC, polarity protected, pulsed SCP\*\*
- 6 = 10-30 VAC, polarity protected, pulsed SCP

**DC:**

- 4 = 10-65 VDC, polarity protected, pulsed SCP\*\*
- 6 = 10-30 VDC, polarity protected, pulsed SCP

\*\*SCP = short-circuit and overload protection

**Output**

- N = NPN transistor (current sinking)
- P = PNP transistor (current sourcing)
- Z = 2-wire AC or 2-wire AC/DC

**Output Function**

- A = normally open (N.O.)
- F = connection programmable (N.O. or N.C.)
- R = normally closed (N.C.)
- V = complementary outputs: one N.O., one N.C.
- Y0 = NAMUR output, requires switching amplifier
- Y1 = NAMUR output, requires switching amplifier/ATEX approved

**Secondary Housing Modifier**

- SR = straight terminal chamber

We reserve the right to make technical alterations without prior notice.

Capacitive Sensors

**Wiring Options\***

**A. Connectorized Sensor**

**Connector Family**

- B1 = Minifast®, Metal, Male
- B2 = Minifast, Plastic, Male
- B3 = Microfast®, Metal, Male
- H1 = Eurofast®, Metal or Plastic, Male
- V1 = Picofast®, Metal, Male

**Connector/Sensor Transition**

- 1 = straight

**Wiring Configuration**

**Example:**

- 1 = Standard
- 3 = N.C. DC Output on Pin 4 (for US)

**Number of Pins**

**B. Potted Cable**

**Cable Length**

- Blank = 2 Meter cable
- 7M = 7 Meter cable

**Special Option Codes\*\***

**Option Code**

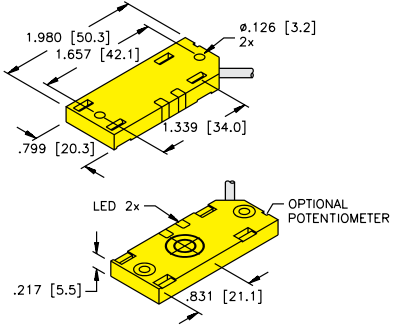

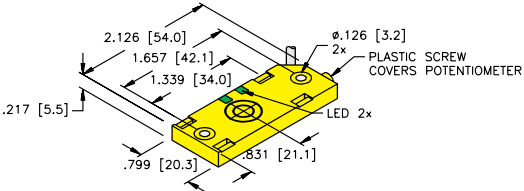

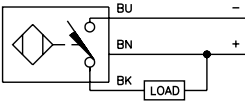

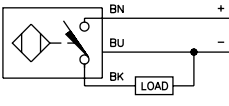

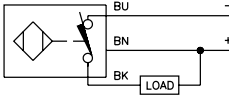

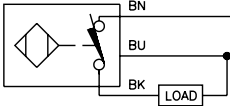

**Example:**

- /S250 = No Potentiometer
- /S400 = Rear LEDs (for Q14 and Q20 only)

#### Amplifier Note:

Inductive sensors with Namur outputs are typically used in hazardous locations and the approval agencies require the use of an amplifier to regulate the signals in the hazardous area. Due to the wide variety of approvals, output options, and amplifier designs, it is not possible to incorporate all of the choices in this catalog. For the most up to date information, please either search for these products under our interface technology product category ([www.turck.us](http://www.turck.us)) or contact us by phone.

We reserve the right to make technical alterations without prior notice.

## Ultrasonic Sensors

The M18 and M30 ultrasonic sensors feature smooth transducer faces, short blind zones, adjustable sensing fields, and robust chrome plated brass barrels, along with multiple options for outputs and configurations that enable users to select the best design for their application.

Output configurations range from a single output with an adjustable set point to versions with configurable outputs either as dual set point, analog, window, retroreflective, or IO-Link. Sensors can be taught via wire, integral buttons, or IO-Link.

Certain M18 and M30 versions are available with ATEX and IECEx approvals for environments that have dust or gases which could be ignited and cause a fire or explosion.

The CK40 and CP40 rectangular ultrasonic sensor family uses separate transducers for the transmitter and receiver, giving these sensors a 60° sonic cone angle for detecting targets, which is much larger than what is possible with the M18 or M30 barrels.

### Performance Curves

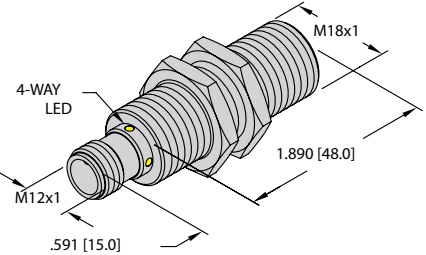

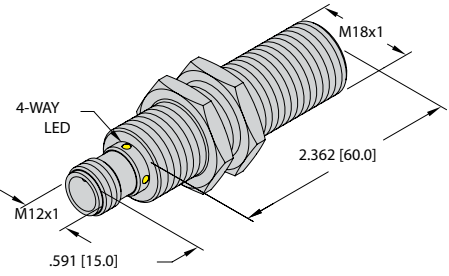

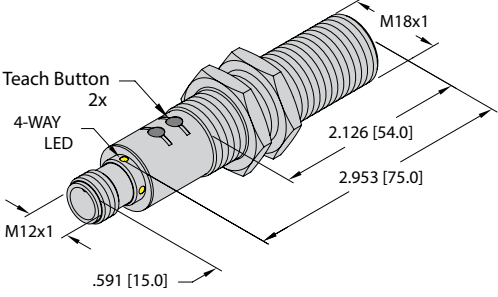

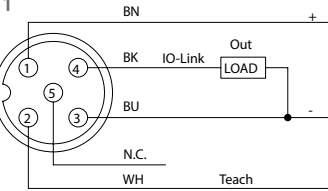

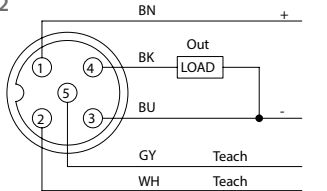

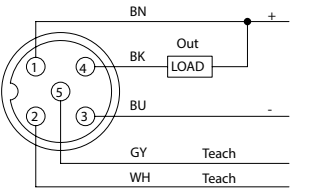

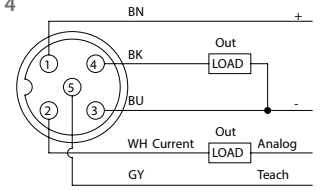

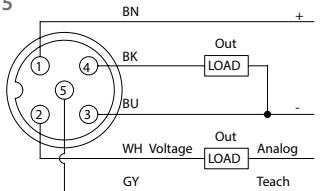

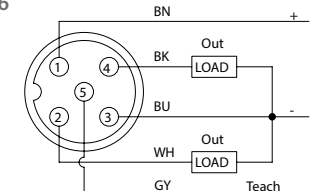

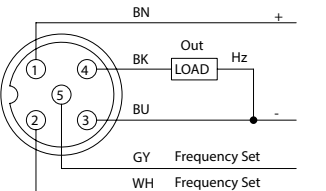

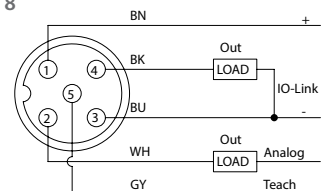

The diagrams show the detection ranges of the individual ultrasonic sensors, covering ranges of 40 to 600 cm. Different targets are used in sizes 20 x 20 mm, and 100 x 100 mm according to the EN standard 60947-5-2, as well as a round rod with a diameter of 27 mm in order to compare the detection ranges of different ultrasonic sensors. When using other targets than the standard ones, the detection ranges may vary due to different reflection properties and geometries.

We reserve the right to make technical alterations without prior notice.

1. This Mounting is to be used only when "Switch Rail" is present on the cylinder.
2. ASB size is determined by the cylinder diameter. See Table 1. KLDT is required when the UNT sensor has integral quick disconnect.
3. These styles are not usually available with magnets.
4. Bracket size determined by the cylinder diameter. See Table 2.

### Wiring Diagrams/Mating Cordsets

### A5 2-wire AC/DC w/ Short-Circuit Protection - (ADZ, RDZ, FDZ, VDZ)

Line Frequency:	≥50... ≤60 Hz
Differential Travel (Hysteresis):	3-15% (5% typical)
Voltage Drop Across Conducting Sensor:	≤6.0 V
Trigger Current for Short Circuit Protection:	AC: ≥440 mA; DC: ≥330 mA
	AC: ≥120 mA; DC: ≥120 mA
Continuous Load Current:	AC: ≤400 mA; DC: ≤300 mA
	AC: ≤100 mA; DC: ≤100 mA
Off-State (Leakage) Current:	≤1.7 mA (AC)
	≤1.5 mA (DC)

Minimum Load Current:	≥3.0 mA
Inrush Current:	≤3 A (≤20 ms, max 5 Hz)
Power-On Effect:	Per IEC 947-5-2
Transient Protection:	Per EN 60947-5-2
Shock:	30 g, 11 ms
Vibration:	55 Hz, 1 mm Amplitude, in all 3 Planes
Repeatability:	≤2% of Rated Operating Distance

## Mating Cordset Selection Guide

### Connectivity

Rugged, durable, and reliable, Turck connectivity products consolidate wiring, connect sensing devices, and distribute power and signals.

#### Cordsets

- Environmentally sealed for harsh environments
- Pin count 2-28 pole
- Power range up to 35 A
- LED visibility
- Industry specific jacketed cable

#### Rugged, Sealed Junction Boxes

- 4, 6, or 8 ports, with or without LEDs for NPN or PNP sensors
- Consolidate wiring
- IO-Link Enabled

#### Splitters

- Increase connection possibilities
- 2, 3, and 4 branch options

#### Wire Consolidation

- Rugged, sealed junction boxes with up to 16 inputs
- Splitters up to 4 branches
- Inductive Coupling (IO-Link Enabled)
- Tees

We reserve the right to make technical alterations without prior notice.

## Smart Plugs

Housing Style	Dimension Drawing
	<p>A</p> 

Add function to existing installations. Solve control problems quickly in the field. Simple plug-in installation - uses industry standard M12x1 4-pin connectors (Eurofast). Programmed through "teach" input - Pin 2. LED aids programming.

TB4 V.2

TX1-Q20L60

USB-2-IOL-0002

Part Number	ID Number	Description
TB3-CP80	6967112	DC powered test box allows you to quickly test 2, 3, 4 wire DC sensors or Namur output sensors, includes batteries.
TB4 V.2	6967113	Analog test box for sensors with analog or switching outputs, includes batteries.
TX1-Q20L60	6967114	Teach adapter for inductive encoders, linear position, angle, ultrasonic and capacitive sensors.
USB-2-IOL-0002	6825482	IO Link master with integrated USB interface for parameterization of IO Link compliant linear position sensors via PC.

### Limit Value Monitor

#### Functional Description:

The limit value monitors IM43-13-SR and IM43-14-SRi are single-channel devices and alternately monitor measuring current of 0/4-20 mA or measuring voltages of 0/2-10 V. The three limit values are set via the front panel teach button. In addition, a voltage of approx. 18 V (at 35 mA max.) is provided, which can be used to power transmitters or sensors. The output mode is jumper programmable at terminals 5-8.

## Important Safety Warning

Turck sensors and peripheral devices DO NOT include the self-checking redundant circuitry required to permit their use in personnel safety applications. A device failure or malfunction can result in either an energized or a de-energized output condition.

Never use these products as sensing devices for personnel protection. Their use as safety devices may create unsafe conditions that could lead to serious bodily injury or death.

## Proximity Sensing Compared to Conventional Methods

Turck proximity sensors are designed using solid state technology and contain no moving parts to wear out, as is common in mechanical switches. They require no physical contact for actuation, no cams or linkages, have no contacts to bounce or arc and are completely encapsulated, making them impervious to most liquids, chemicals and corrosive agents. In addition, Turck has a line of sensors that can be used in hazardous explosive environments without any special enclosures.

See Hazardous Area Locations in Section A.

### If any of the following conditions exists, a Proximity Sensor should be used:

- The object being detected is too small, too lightweight, or too soft to operate a mechanical switch.
- Rapid response and high switching rates are required, as in counting or ejection control applications.
- Object has to be sensed through non-metallic barriers such as glass, plastic, or paper carton.
- Harsh environments demand improved sealing properties, preventing proper operation of mechanical switches.
- Long life and reliable service are required.
- Fast electronic control system requires bounce-free input signal.

## Common Industries for Proximity Sensors

- Mining and Metallurgy
- Foundries
- Automatic Assembly and Robotics
- Conveyor Systems in Airports and Factories
- Chemical Plants and Oil Refineries
- Semiconductor Equipment
- Sheet Metal Fabrication
- Automotive and Appliance Plants
- Electroplating Installations
- Can Plants, Food Processing and Breweries
- Shipyards, Docks, and Off-shore Drilling Rigs
- PC-board Handling Machinery

## Typical Applications

- Parts Detection
- Parts Counting
- Positioning
- Motion and Speed Control
- Bottle Cap or Can Lid Detection
- Punch Press Feed and Ejection Control
- Broken or Damaged Tool Detection
- Void or Jam Control
- Feed Control
- Indexing
- Inter-lock Control
- Liquid Level Control
- Leak Detection
- Machine Programming
- Valve Position Indication
- Missing Parts Control
- Parts Diverting
- Coin Counting and Sorting
- Edge Guide Control
- Robotics and Conveyors

**Operating Principle Ferrite Core**

Figure 1

An inductive proximity sensor consists of a coil and ferrite core arrangement, an oscillator and detector circuit, and a solid-state output (Figure 1). The oscillator creates a high frequency field radiating from the coil in front of the sensor, centered around the axis of the coil. The ferrite core bundles and directs the electro-magnetic field to the front.

When a metal object enters the high-frequency field, eddy currents are induced on the surface of the target. This results in a loss of energy in the oscillator circuit and, consequently, a smaller amplitude of oscillation. The detector circuit recognizes a specific change in amplitude and generates a signal which will turn the solid-state output "ON" or "OFF". When the metal object leaves the sensing area, the oscillator regenerates, allowing the sensor to return to its normal state.

**Mounting**

Turck inductive proximity sensors are available with either a shielded coil, designated by "Bi" in the part number, or a unshielded coil, designated by "Ni" in the part number. Embeddable (shielded) sensors may be safely flush-mounted in ferrous metal. Nonembeddable (unshielded) sensors require a metal free area around the sensing face. Due to the possible interference of the electromagnetic fields generated by the oscillators, minimum spacing is required between adjacent or opposing sensors. See mounting characteristics at the front of each section.

It is good engineering practice to mount sensors horizontally or with the sensing face looking down. Avoid mounting sensors with the sensing face looking up wherever possible, especially if metal filings or chips are present.

Embeddable construction includes a metal band that surrounds the ferrite core and coil arrangement. This helps to "bundle" or direct the electromagnetic field to the front of the sensor, allowing the sensor to be mounted fully surrounded by metal (flush mounting).

Nonembeddable sensors do not have this metal band; therefore, they have a longer operating distance and are side sensitive.

We reserve the right to make technical alterations without prior notice.

## Operating Distance (Sensing Range) Considerations

The operating distance ( $S$ ) of inductive proximity sensors is basically a function of the diameter of the sensing coil. The maximum operating distance is achieved with the use of a standard or larger target. The rated operating distance ( $S_n$ ) for each model is given in the manual. When using a proximity sensor the target should be within the assured range ( $S_a$ ).

### Standard Target

A square piece of mild steel having a thickness of 1 mm (0.04 in) is used as a standard target to determine the following operating tolerances. The length and width of the square is equal to either the diameter of the circle inscribed on the active surface of the sensing face or three times the rated operating distance  $S_n$ , whichever is greater.

### Operating Distance = $S$

The operating distance is the distance at which the target approaching the sensing face along the reference axis causes the output signal to change.

### Rated Operating Distance = $S_n$

The rated operating distance is a conventional quantity used to designate the nominal operating distance. It does not take into account either manufacturing tolerances or variations due to external conditions such as voltage and temperature.

### Effective Operating Distance = $S_r$ $0.9 S_n \leq S_r \leq 1.1 S_n$

The effective operating distance is the operating distance of an individual proximity sensor at constant rated voltage and 23°C (73°F). It allows for manufacturing tolerances.

### Usable Operating Distance = $S_u$ $0.81 S_n \leq S_u \leq 1.21 S_n$

The usable operating distance is the operating distance of an individual proximity sensor measured over the operating temperature range at 85% to 110% of its rated voltage. It allows for external conditions and for manufacturing tolerances.

### Assured Operating Range = $S_a$ $0 \leq S_a \leq 0.81 S_n$

The assured operating range is between 0 and 81% of the rated operating distance. It is the range within which the correct operation of the proximity sensor under specified voltage and temperature ranges is guaranteed.

## Technical Reference | Inductive

### Operating Distance (Sensing Range) Considerations

Turck standard inductive sensors use a single coil wound around a ferrite core. This coil induces eddy currents on the metal target, which results in energy loss in the oscillator circuit, enabling the detection of metal objects. The energy loss is greatly depended on the magnetic properties of the metal target. Ferrous and nonferrous metals affect the sensor differently, resulting in a different operating distance to different metals.

These correction factors apply to standard inductive sensors when a nonferrous target is being detected. The correction factors are nominal values. Deviations may be due to variations in oscillator frequency, alloy composition, purity and target geometry.

Aluminum foil	1.00
Stainless steel	0.60 to 1.00
Mercury	0.65 to 0.85
Lead	0.50 to 0.75
Brass	0.35 to 0.50
Aluminum (massive)	0.35 to 0.50
Copper	0.25 to 0.45

- Correction factors do not apply to Turck Uprox<sup>®</sup> sensors. These sensors detect all metals at the same range.
- Turck also manufactures “nonferrous only” sensors. These sensors will selectively detect nonferrous targets at the rated operating distance. They will not detect ferrous targets; however, ferrous targets positioned between them and a nonferrous target may mask the nonferrous target. The rated operating distance of these sensors is not subject to the correction factors that apply to standard inductive sensors.

### Differential Travel (Hysteresis)

Figure 2

### Actuation Mode

Inductive sensors can be actuated in an axial or lateral approach (Figure 2). It is important to maintain an air gap between the target and the sensing face to prevent physically damaging the sensors.

The difference between the “operate” and “release” points is called differential travel (See shaded area in Figure 7). It is factory set at less than 15% of the effective operating distance.

Differential travel is needed to keep proximity sensors from “chattering” when subjected to shock and vibration, slow moving targets, or minor disturbances such as electrical noise and temperature drift.

**Maximum Switching Frequency**

Figure 3

When using inductive sensors in high speed application, the maximum rated switching frequency is only guaranteed when using optimal target dimensions and sensor spacing. The minimum recommended parameters to use are shown in **Figure 3**. Using smaller targets, target spacing or increasing the sensor to target air gap may result in a reduction of the actual achievable maximum switching frequency. See page J4 for determining dimension “A” of a standard target.

**Weld Field Immunity**

Many critical applications for proximity sensors involve their use in welding environments. AC and DC resistance welders used in assembly equipment and other construction machines often require in excess of 20 kA to perform their weld function. Magnetic fields generated by these currents can cause false outputs in standard sensors.

Turck has pioneered the design and development of inductive proximity sensors that not only survive such environments, but remain fully operative in them.

The limit of the weld field immunity depends on the kind of field (AC or DC), the housing size of the sensor and its location in the field. For example, in an AC or DC weld field, the “/S34” inductive sensors can be positioned one inch from a 20 kA current carrying bus.

**Reference Values for Magnetic Induction:**

I [kA]	12.5 mm	25 mm	50 mm	100 mm
5	80 mT	40 mT	20 mT	10 mT
10	160 mT	80 mT	40 mT	20 mT
20	320 mT	160 mT	80 mT	40 mT
50	800 mT	400 mT	200 mT	100 mT
100	1600 mT	800 mT	400 mT	200 mT

Gauss = 10 x mT

We reserve the right to make technical alterations without prior notice.

**Operating Principle Uprox®**

Turck Uprox is a patented next generation development of inductive sensors that uses a multi-coil system. Active coil(s) induces eddy currents on the metal target and passive coil(s) are affected by these eddy currents. Ferrous and nonferrous metals have the same effect on the two coils. Therefore, all metals, including galvanized metals, have the same rated operating distance.

**Uprox Advantage**

Figure 4

- No Correction Factor - Same rated operating distance for all metals.
- Extended Operating Distance - Up to 400% greater than standard inductive sensors when using non-ferrous targets (Figure 4).
- Weld Field Immunity - Uprox is unaffected by strong electromagnetic AC or DC fields because of its unique patented design.
- High Switching Frequencies - Up to 10 times faster than standard inductive sensors.
- Extended Temperature Range - Uprox+ can withstand temperatures up to 85 °C (+185 °F) with a ±15% temperature drift.
- Select Uprox3 sensors are IO-Link compatible.

We reserve the right to make technical alterations without prior notice.

## Cylinder Position Sensors – Magneto-Resistive

Turck Magneto-resistive cylinder position sensors are used for the detection of magnet equipped pistons on pneumatic and other types of cylinders. These non-contact sensors are able to determine the position of the cylinder piston without diminishing the integrity of the cylinder itself. This allows the sensors to operate without intruding upon the cylinder, keeping the system completely intact.

Turck has taken the approach of using only two sensor styles along with various adapter brackets to fit each individual cylinder's requirements. The "UNT" and "UNR" housings were designed to fit into specific grooves found in extruded profile type cylinders as stand alone devices without the need for any additional brackets. The UNT style was made to fit into a 5.2 mm "T" groove and the UNR was made for use in a 4.0 mm round groove, neither requiring additional hardware for mounting. Both of these designs allow the sensor to be dropped in from above anywhere along the span of the cylinder.

Cylinder brackets allow Turck sensors to mount on most cylinder styles including round, tie-rod, extruded profile groove, and dovetail versions.

### Where Can I Use a Magneto-Resistive Sensor?

- Material handling
- Automated assembly
- Stamping
- Conveying
- Sorting
- Product positioning
- Industrial robots

We reserve the right to make technical alterations without prior notice.

Technical Reference | Magnetic

**Cylinder Position Sensors – Magneto-Resistive (continue)**

Turck translated this “drop in from the top” approach when designing the adapter brackets as well. By eliminating the need to slide the sensor in from the end of the cylinder it reduces installation time, alleviates the need for the cylinder to be disassembled, and allows for installation right on the floor without interrupting the operation of the cylinder. These sensors are manufactured using a plastic overmolding technology, which allows us to completely seal sensors into smaller packages without compromising on durability. Smaller sensors that are compact with very low profiles also reduce the chance of damage when mounted to the outside of the cylinder.

**Turck Magneto-Resistive Sensor Advantage**

**Reliable Mounting**

The sensor is mounted in the cylinder’s groove and tightened with a screw. Located near the cable outlet, the screw helps make sure the sensor doesn’t move during vibration or if the cable is pulled.

**Visible LED**

A bright LED indicates the current switching status, and is visible from any position.

**Compact Housing Style**

UNT models measure only 28 mm, while UNR models measure only 18 mm, making them the most compact sensors available on the market. Since the active sensing face is located at the end of the sensor, the piston can be detected up to the end, even on compact short stroke cylinders.

**Standards**

Magneto-resistive technology enables the sensor to detect the exact position of the magnet, while avoiding multiple switching points. It also exceeds IEC standards EN60947-5-2 and EN61000-4-6, making it immune to high levels of EMC.

We reserve the right to make technical alterations without prior notice.

**Cylinder Position Sensors – CRS Inductive**

Turck’s CRS sensors are designed to be mounted into the head end or cap end of hydraulic and pneumatic cylinders. They operate at 1,500 psi and mechanically withstand 3,000 psi of continuous pressure.

**AGC - Air Gap Cushion**

This dimension is recommended to allow for mechanical tolerances and wear.

**AGR - Air Gap Rod**

The rod-to-cushion step must be large enough to allow the sensor to turn off when the piston leaves. If the step is too small, the sensor will lock-on due to the hysteresis of the sensor.

Technical Reference

**Permaprox Inductive Magnet Operated Sensors**

Turck's Permaprox cylinder sensors are used for detection of magnet equipped pistons on pneumatic cylinders through a non-magnetic cylinder wall. A patented electronic magnetic circuit involving new state-of-the-art materials forms the basis of operation for these sensors.

The characteristics of this innovative technology have distinct advantages over Hall effect switches and reed devices. Specific sensors no longer have to be matched to specific magnet strengths. Other features include extremely high repeatability and the elimination of multiple actuation points.

**Actuation Area/Differential Travel**

Figure 5

Figure 6

**Figure 5 curve definitions:**

- A) Typical actuation area of Permaprox sensors
- B) Typical primary actuation area for reed switches
- C) Typical secondary actuation area for reed switches

The Permaprox sensors, unlike most magnet operated sensors, respond to only one component of magnetic induction, namely the component parallel to the cylinder. **Figure 5** shows the typical actuation area of a Permaprox sensor compared to that of reed switches. It is a common problem for reed switches to have more than one actuation area. Since these switches operate on a narrow range of magnetic field strengths, mismatching often causes multiple switching points. The Permaprox sensors, however, reliably operate over a range of 20-350 gauss (2-35 mT).

The actuation area will depend on the width and field strength of the magnet. As shown in **Figure 6**, the actuation point will differ depending on the direction of piston travel. These points are not the same, but are very repeatable.

**Permaprox Weld Field Immunity**

All Turck Permaprox sensors with the "S34" suffix in the part number are resistant to AC weld fields. If the field is pulsing, as with AC resistance welders, the sensor locks the output in its last known stable state. When the pulsing field subsides, the sensor updates its output accordingly. The sensors are not immune to constant magnetic fields, such as permanent magnets or DC resistance welders, and will change state.

We reserve the right to make technical alterations without prior notice.

## Technical Reference | Capacitive

Capacitive sensors utilize a non-contact sensing technology that detects a wide variety of materials. When equipped with a sensitivity adjustment users can tune out certain materials such as glass or plastic, making this type of sensor a common choice for point level applications. Typical applications include but are not limited to:

- Liquid Level Control for both flammable and non-flammable materials.
- Package Inspection for product content and/or fill level.
- Wire-Break Detection for wire sizes down to .003".
- Plastic Pellet Detection in a hopper for injection molding processes.
- Grain or Food Products Level Detection; intrinsically safe models available.
- Small Metal Parts Detection; greater sensing range than comparable Inductive Sensors.

### Operating Principle

Figure 7

Figure 8

The active element is formed by two metallic electrodes positioned much like an “opened” capacitor (**Figure 7**).

Electrodes A and B are placed in a feedback loop of a high frequency oscillator. When no target is present, the sensor’s capacitance is low, therefore the oscillation amplitude is small. When a target approaches the face of the sensor, it increases the capacitance. This increase in capacitance results in an increased amplitude of oscillation.

The amplitude of oscillation is measured by an evaluating circuit that generates a signal to turn on or off the output (**Figure 8**).

We reserve the right to make technical alterations without prior notice.

## Operating Principle

Capacitance is a function of the surface area of either electrodes (A or B), the distance between the electrodes (d), and the dielectric constant of the material ( $\epsilon$ ) between the electrodes.

$$C = \frac{\epsilon \times A}{d}$$

C = capacitance of sensor

A = surface area of either electrode

d = distance between two electrodes

$\epsilon$  = dielectric constant of material between the electrodes

Figure 9

When a Conductive Target enters the sensor's field, it forms a counter electrode to the active face of the sensor, thus decreasing the distance between the electrodes (d) and increasing their average surface area (Figure 9). The capacitance with a metal target present is always greater than the capacitance of the circuit in the absence of the target. Reduction factors for different metals are not a consideration when using capacitive sensors.

Figure 10

When a Non-Conductive Target enters the sensor's field, it acts as an electrical insulator between electrodes A and B (Figure 10). The dielectric constant of the material ( $\epsilon$ ) is a measure of its insulation properties. All liquids and solids have a greater dielectric constant than air ( $\epsilon_{\text{air}} = 1$ ). Therefore, the capacitance with a non-metallic target present is always greater than the capacitance of the circuit in the absence of the target.

Technical Reference | Capacitive

**Temperature and Environmental Conditions**

Figure 11

A and B – SENSOR ELECTRODES  
C – COMPENSATION ELECTRODES

**Compensation Electrode**

In practice, sensors can be affected by water droplets, humidity, dust, etc., causing false outputs. To combat this effect each Turck sensor incorporates a compensating electrode (C) which forms part of a negative feedback circuit (Figure 11).

When contaminants are on the sensor face, they affect the sensor’s main field, as well as its compensation field. The negative feedback circuit detects the increase in both fields, and can filter out the effects of the contaminants.

When a large target comes into the sensor’s main field, the compensation field is not affected, thus the negative feedback circuit can distinguish a difference between the two fields, and the sensor generates an output.

**Mounting**

Figure 12

**Compensation Electrode**

Most capacitive sensors manufactured by Turck are embeddable, which ensures that the electric field is only effective in front of the active face. They are suitable for flush mounting at the factory setting in any material (conductive and nonconductive).

When sensors are flush mounted, the effect on the operating distance is minimal and can be overcome by adjustment of the potentiometer. Minimum separation distances must be observed to avoid the possibility of interference between the two sensors’ fields (Figure 12).

We reserve the right to make technical alterations without prior notice.

## BCF Series – Noise Immunity

Capacitive sensors were originally designed for use in level detection applications in areas that were generally far away from other electrical equipment. As factory automation has become more prevalent throughout industrial markets, these capacitive sensors have gravitated into new environments where electrical noise levels are greatly increased. Electrical noise can be produced by various sources including variable frequency drives, electromechanical motors and standard walkie-talkie devices. These “noisy” environments can have adverse effects on sensing devices causing them to operate improperly and unreliably.

Turck recognizes this and has developed a new circuit for its capacitive sensors. These new “BCF” sensors incorporate a unique filter principle, making them immune to most industrial noise. This principle involves a fixed oscillator frequency combined with a rectifier filter providing superior noise immunity over the competition.

Turck’s fixed oscillator allows the sensor to maintain a constant frequency regardless of sensitivity adjustment. This fixed frequency is high enough to ignore most of the “standard” noise levels seen on plant floors. Electrical noise is mostly symmetrical which makes it easier to identify and separate from the sensor’s input signal. The Turck rectifier filter is able to block this noise allowing only the “useful” input signal, which is in phase with the oscillator frequency, to pass.

These two innovative electrical techniques give Turck the best defense against industrial noise. The list of specifications and test results below demonstrates how Turck meets or exceeds all of the rigid standards established by CE. In fact, the criteria set forth by CE is so stringent that most capacitive sensors offered on the market today cannot pass any or all of these testing requirements. If you have a capacitive sensor application located in a “noisy” environment choose the new “BCF” sensors from Turck to ensure your process operates smoothly.

Test Type		CE "Product" Standard	CE "Generic" Standard	Turck "BCF" Noise Immune Capacitive Sensors
Immunity to Electrostatic Discharge (ESD)	IEC 1000-4-2 EN 61000-4-2	4 kV Direct Contact 8 kV Airborne	4 kV Direct Contact 8 kV Airborne	8 kV Direct Contact 30 kV Airborne
Immunity to Radiated Electromagnetic Fields. Radio Frequency Interference (RFI)	IEC 1000-4-3 EN 61000-4-3	3 V/M 80-1000 MHz	10 V/M 80-1000 MHz	15 V/M 80-1000 MHz
Immunity to Electrical Fast Transients (Burst-High Voltage)	IEC 1000-4-4 EN 61000-4-4	2000 V	2000 V	3000 V
Immunity to Conducted R.F. Voltage (Line Coupled Noise)	IEC 1000-4-6 EN 61000-4-6	Undefined	10 V 150 kHz-80 MHz	>10 V 150 kHz-230 MHz
Immunity to Surges (Lightning Strike)	IEC 255-5	1 kV, 500Ω DC	Undefined	1 kV, 500Ω DC 5 kV, 500Ω AC

We reserve the right to make technical alterations without prior notice.

## BCC Series-Plastic Pellets, ESD, and Metal Containers

The BCC series capacitive sensor is specifically designed to provide accurate level detection in the plastic industry. Applications involving plastic pellets often generate high levels of static electricity which can discharge and lead to sensor failure. The BCC series of sensors feature excellent EMC and ESD immunity, allowing them to reliably detect the level of plastic pellets in a hopper while withstanding environmental interference.

These sensors can also be mounted directly into a metal tank without a reduction in range, a common side-effect for standard capacitive sensors. The BCC incorporates a unique laterally mounted shield that protects the sensors from being influenced by the metal tank. This allows the sensor to detect even low-dielectric materials when the sensor is flush mounted in metal.

Technical Reference | Capacitive

**Sensing Range vs. Dielectric Constant**

When sensing non-conductive targets, the larger the dielectric constant of a material, the greater the achievable operating distance (Figure 13). Adjusting the potentiometer affects the total curve; for example, if the potentiometer is adjusted for less sensitivity, it will have less operating distance to all materials. In general terms, the larger the dielectric constant of a material, the greater the achievable operating distance. When detecting organic materials the sensing distance will depend largely on the water content ( $\epsilon_{\text{water}} = 88$ ). It should be noted that a large increase in sensitivity will cause the sensor to become nonembeddable, and may result in an unstable switching point that can be influenced by environmental changes such as temperature, humidity, dust, etc. At adjustments of  $S > S_n$ , the differential travel (hysteresis) can also increase.

Figure 13

We reserve the right to make technical alterations without prior notice.

**Sensitivity Adjustment**

Capacitive sensors can be adjusted in order to sense a target consistently.

- Physical adjustment - moving the sensor towards or away from the target is the preferred method of adjusting sensitivity when the sensor is not in direct contact with the target. This allows materials to be moved into or out of range while leaving the sensor at the factory setting or after re-calibration to the nominal operating distance  $S_n$ .
- Adjustment of the potentiometer - turning the potentiometer in a clockwise direction increases the sensitivity of the sensor. The potentiometer is factory-set for an operating distance of 0.7 to 0.8  $S_n$  to a grounded standard target (Figure 14). It should be adjusted in increments of no greater than a quarter-turn (Figure 15). Increasing the sensitivity results in a greater operating distance to both conductive and non-conductive targets.
- Teachable sensors allow users to teach tank-full and tank-empty conditions using the built in buttons or a teach adapter. The programming process and built in logic ensure the sensor is optimized to reliably detect the desired object.
- IO-Link- sensors equipped with IO-Link feature advanced options including the ability to program the sensors with an IO-Link master. The flexibility provided by IO-Link allows users to adjust sensor settings as their processes change.

Figure 14

Figure 15

## Example Application 1 - Adjustment

### Problem:

Can a BC20-K40SR-FZ3X2 be used to sense the presence of ammonia from behind a .125" glass panel?

### Solution:

The dielectric constants for these materials can be found on pages 17 and 18.

Dielectric ( $\epsilon_r$ ) of ammonia: 20

Dielectric ( $\epsilon_r$ ) of glass: 10

From Figure 7,  $\epsilon_r = 20$  corresponds to 80% Sn;  $\epsilon_r = 10$  corresponds to 60% Sn.

Since Sn =	20 mm for a BC20:	S for ammonia =	16 mm
		S for glass =	12 mm

The difference is 4 mm. The glass thickness = .125", or 3.1 mm. This application will work with a 0.9 mm margin. This means that by adjusting the potentiometer there should be a reasonable distinction between the glass and the ammonia as seen by the sensor.

### To set up the sensor for this application, the sensing face of the sensor should be flush against the sight glass.

- With no ammonia present (if possible) turn the potentiometer clockwise until the sensor turns on. If the sensor is already on, skip step one.
- Next, turn the potentiometer counter clockwise until the sensor turns off.
- Now add the ammonia so that it covers the glass panel.
- Once again, turn the potentiometer counter clockwise, counting the number of turns until the sensor turns off.\*
- Divide the number of turns by two and turn the potentiometer back clockwise that amount. Using this process will allow for a margin of error in either direction. If this application had called for something other than ammonia, like molasses, that tends to leave buildup behind, step 1 above should be performed with the buildup present (if possible).

\*If sensor does not turn off after 10 full turns, turn back the potentiometer clockwise between three to five turns. Minor adjustments may need to be made to achieve desired setting.

## Example Application 2 - Mounting

### Problem:

A metal tank containing a water-based solution has a 1" outside diameter sight glass. What sensor and bracket could be used for monitoring the liquid level?

### Solution:

The QF 5.5 flat style can be used on non-conductive tubing up to 1.0 inch in diameter with the standard mounting straps provided with the sensor (**Figure 16**). Other mounting straps for larger diameters are available upon request (consult factory).

Figure 16

## Technical Reference | Ultrasonic

Ultrasonic sensors use reflected sound waves as a means to detect objects at a greater distance than traditional inductive and capacitive sensors. With ranges of several meters and wide sensing cones, these sensors provide a unique solution to challenging applications.

### Operating Principle

Ultrasonic sensors emit one or several ultrasonic pulses that are broadcasted in the air at the speed of sound. A part of the ultrasonic wave is reflected back to the sensor by the target. The sensor measures the total time of flight from the sensor to the object and back to the sensor. The distance to the object is then calculated with the following formula:

$$D = c \times t / 2$$

D = Distance from the sensor to the object

c = Speed of sound in air

t = Time of flight for the ultrasonic pulse

To improve accuracy and reliability, the ultrasonic sensor averages the measurement of several sound pulses before the output is updated.

We reserve the right to make technical alterations without prior notice.

### Ultrasonic Terminology

#### Some key terms to understand when looking for an ultrasonic sensor.

- **Blind zone:** the blind zone is the area in front of the sensor where targets cannot be detected.
- **Sensing range:** the coverage of the device is the sensing range, or the maximum distance the sensor can read the sonic wave.
- **Active sensing area:** is the area where the set points or analog values can be established.
- **Cone angle:** the cone angle defines the coverage area of the sensor. This will have to be taken into account when placing the sensor in the application. If the cone is disrupted errors or miscommunication can occur.

### Changes in Temperature

The ultrasonic velocity depends on the composition and the temperature in which the sound is transmitted. In most ultrasonic-applications, the composition of the atmosphere is stable whereas the temperature may often fluctuate. Fluctuations in air temperature affect the speed of sound, which in turn has an effect on the total time for the echo measured by the sensors. Our sensors are temperature compensated and will adjust the range automatically to minimize errors.

The speed of sound in air varies with the temperature according to the following approximation formula:

$$Cm/s = 20 \times \sqrt{273 + TC}$$

Cm/s = Speed of sound in meters per second

TC = Temperature in °C

### Atmosphere Conditions

It is always recommended to set up the ultrasonic sensors desired switch points and/or analog range in the environment that it will be used. Ultrasonic sensors will work in dust, rain and snow but if the conditions are too substantial it may reduce the sensors range or inhibit the sensor to read the target.

Turck ultrasonic sensors feature a flush face that allows dirt and water to be wicked away with the vibrating motion of the sensing element.

## Modes of Operation

- Diffused mode: standard operation mode where the sensor is emitting sound waves and listening for the reflection and sensing if it is within the selected output zone. This mode can also have an analog output to give a linear measurement.
- Retro: reflective mode—sensor is set up with a reflector and sensing anything that crosses between the sensor and reflector. This is also known as break-beam, which is good for objects with an irregular shape or poor sound-reflecting qualities.
- Opposed mode: enlarges the range of an ultrasonic application. This mode utilizes two sensors of the same type. One sensor sends the signal and the other receives the signal allowing for the sensing range to double.
- Enable mode: allows the sensor to be powered but the piezo element does not fire unless a voltage is applied to pin 5. This allows for the sensor to reduce startup time and only be sensing for a target during a known condition. Enable mode also allows the sensor to be active during predetermined times or under a known condition.

Diffused Mode

Retro-Reflective Mode

Opposed Mode

## Synchronization and Multiplexing Mode

- Synchronization mode: any number of ultrasonic sensors of the same type can be operated simultaneously without mutual feedback. The sensors will act as one.
- Multiplexing mode: enables up to nine ultrasonic sensors of the same type to be operated at fixed intervals one after the other without mutual feedback. In order to ensure proper functioning of the multiplexing mode, all connected sensors must have the same type code. In multiplexing mode the addresses must be assigned via PACTware.

We reserve the right to make technical alterations without prior notice.

# Technical Reference | Ultrasonic

## Teaching the Ultrasonic Sensor

Ultrasonic sensors can be taught via a teach wire, programming button, or IO-Link, depending on the model.

### Programming changes that can be done through the teach wires/buttons are below

- Discrete output condition, normally open/ normally closed
- Window or hysteresis mode
- Sensing range
- Analog output type, current or voltage
- Retro-reflective mode

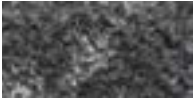

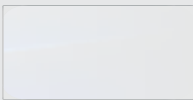

### Programming changes that can be done through IO-Link

- Changing mode of operation
- Discrete output type and condition, NPN/PNP, normally open/ normally closed
- Analog output type, current or voltage
- Teach button/wire lock
- Window or hysteresis mode
- Sensing range
- Analog output type, current or voltage

## Targets

Good ultrasonic targets have a hard smooth surface such as metals, glass, stone, or wood, as well as liquids that are aligned appropriately to the sensor. These targets reliably reflect sonic waves regardless of color or transparency. Cloth, sand, foam or grains absorb some of the sonic energy resulting in limited range or unstable operation. It should be noted that some materials can be detected using retro-reflective mode.

✓		✗	
Material		Material	
Cardboard		Carpet	
Glass		Foam	
Smooth Wood		Textiles	
Metal			

We reserve the right to make technical alterations without prior notice.

## Application Considerations

### Target Orientation

The orientation of a target is important. If the flat surface is at an angle the sensor will not receive the reflected sound.

### Reflector

A reflector at a 45° angle can be used to redirect the signal or allow flexible mounting of the sensor.

### Obstructions

When mounting an ultrasonic sensor the cone angle has to be taken into consideration. Physical obstructions within the cone angle can cause unstable sensor operation. This is common when mounting the sensor too close to the side of a tank, inside of a tube/stilling well, or mounting close to a wall.

### Level Applications

Ultrasonic sensors can be used to monitor the level of both dry materials and liquids. By positioning the sensor above the materials, users can then program switch points or an analog output that corresponds to the actual level.

#### Variables that negatively affect sensor performance

- Foam: foaming media tends to absorb the acoustic signal
- Surface Turbulence: agitation, mixing, and other processes that cause excessive liquid turbulence can cause intermittent signal return problems
- Pressure: pressurized containers should be avoided as they change the sensor characteristics

We reserve the right to make technical alterations without prior notice.

## IO-Link: Simple, Seamless, Efficient

We reserve the right to make technical alterations without prior notice.

Today, most sensors and actuators are already equipped with microprocessors that are used to control indication, parameterization, and store configuration data. The next step is to overcome the bottleneck of the binary standard interface and make additional functions centrally accessible for the automation system.

For this reason, many well known manufacturers from the field of automation have come together and developed a fieldbus-independent communication interface for sensors and actuators known as IO-Link. Compatibility with existing technologies was the primary objective during development in order to guarantee investment protection.

### What is IO-Link?

IO-Link is based on a point-to-point connection between the sensor/actuator and an interface module. Previously, the binary connection was only designed for transferring switching information, but IO-Link now allows two bytes to be transferred normally in a 2 ms cycle via a combined switching status and data channel. Other information can be exchanged in addition to the process values, such as parameters or diagnostics messages. This enables communication with sensors and actuators down to the “last meter” to be established for universal communication.

### Standard Wiring

IO-Link does not require any special wiring. The sensors and actuators can continue to be connected using the proven, unshielded and attractively priced industrial three core cables. The operating modes available for selection are the standard switch mode and the communication mode.

### Benefits

IO-Link users benefit from reduced machine costs, efficient processes and improved machine availability. Turck provides one of the most comprehensive IO-Link portfolios worldwide, from a variety of sensors, cables and active IO-Link junction boxes to interfaces for various industrial fieldbus protocols, including Turck Multiprotocol Ethernet products.

## Technical Reference | IO-Link

### Engineering Tool Integration

Standardized interfaces (DTM/IODD) implement seamless integration into engineering tools. Furthermore, integration into standalone tools such as Asset management or configuration tools is also made available. Connection into enterprise level tools is accomplished using standard Ethernet mechanisms.

### Device Identification

Integrated device identification ensures that the correct device has been installed in the case of component replacements. As each device contains detailed information regarding the manufacturer, component replacement can be safely handled automatically.

### Wiring

IO-Link uses the same standard unshielded 3-core cables with standardized pinning as conventional I/O. This eliminates problems with complex devices which have no pinning standards and often multipole connectors.

### Ethernet/Fieldbus Connection

IO-Link allows connection to most major fieldbuses, as well as Industrial Ethernet. Turck offers solutions for the full range, including master modules for its modular and block I/O systems featuring Multiprotocol Ethernet, which work seamlessly with PROFINET, EtherNet/IP and Modbus TCP in a single device.

### Sensor Mounting

All IO-Link devices allow parameter changes and diagnostic evaluation within the engineering system or separate tools. Devices can now be mounted in the machine where they make sense for the application, not in inconvenient areas that disrupt work flow in order to allow access to display or switches.

### I/O Hubs

Allow the integration of standard 24 VDC devices into automation systems via IO-Link with Turck I/O hubs. Variants for inputs, outputs and a version with configurable digital I/O are currently available.

We reserve the right to make technical alterations without prior notice.

### Efficient Processes

- Extensive parameterization options for just in time parameter changes to devices
- Efficient processes requiring different parameter sets for switching thresholds, gain, sensitivity and so forth due to differing production conditions
- Faster tool change operations

### Improved Machine Availability

- Comprehensive status information and diagnostic capabilities in the plant lead to drastically reduced machine downtime
- Enhanced information enables cost saving mechanisms such as predictive maintenance or asset management to be easily implemented
- Device replacement without manual intervention to parameterize the new unit alleviates the need for qualified personnel

## Turck: Your Value Added IO-Link Solution Partner

Skid application in an automotive plant

Robotic tool changer application

Many manufacturers offer IO-Link products, which can make it difficult to find the most suitable partner for your needs. Turck offers a wide variety of IO-Link solutions – from sensors through programmable fieldbus and Ethernet gateways – but also provides a deep application knowledge, as the following example shows.

### Tool Changer

Many applications require that parts of a machine are changed to accommodate different phases in the production cycle. This necessitates providing manifold connections between the main (fixed) part of a machine and the exchangeable part. The two elements of the machine must then be linked mechanically and electrically to provide power, pneumatics and I/O signals to enable data exchange within the machine.

The electrical connections require large multi-pin connectors and multicore cables to achieve this end. This complexity has a price: the connections regularly cause problems and are expensive to buy and maintain. The fact that the connections also require a high degree of accuracy regarding the mechanical alignment between machine components further increases machine costs. Another difficulty with this arrangement involves distinguishing between several variants of an exchangeable part. If this is necessary, further I/Os are required, both in the I/O system and on the machine. This not only increases costs, but also the complexity and sizing of the connectors between machine parts.

### Value Added IO-Link Solution

Turck inductive couplers are capable of transferring both data and power over an air gap to resolve the previously mentioned problems. The contactless couplers eliminate the need for other mechanical connectors or costly slip rings, which are liable to wear. Additionally, all Turck IO-Link devices are capable of allocating a so-called “Application Specific Tag” (part of the IO-Link specification), which fulfills the requirement of identifying changeable parts without incurring additional costs. Furthermore, this built-in mechanism allows the use of alphanumeric information, making it likely that existing identification codes can be reused.

### Reduced Machine Costs

- Reduced inventory due to intelligent multi-purpose devices
- Only one I/O module and one inexpensive standard cable required
- Reduced I/O footprint possible
- Displays and switches no longer required on devices
- Reduced engineering and assembly costs and automatic documentation of device parameters during the engineering phase

We reserve the right to make technical alterations without prior notice.

## Technical Reference | DC Wiring

### DC Outputs

Two-, three-, or four-wire proximity sensors contain a transistor oscillator and a snap-action amplifier. This provides exceedingly high accuracy to a set switching point, even with very slowly approaching targets. Switching characteristics are unaffected by supply voltage fluctuations within the specified limits.

The sensors can drive electromechanical relays, counters, solenoids, or electronic modules, and interface directly with logic systems or programmable controllers without additional interface circuitry. They are available with either NPN output transistors (current sinking) or PNP output transistors (current sourcing).

Load current ratings vary from 100 to 200 mA depending on physical size. Standard voltage range is 10-30 VDC with certain types available for 10-65 VDC. All models incorporate wire-break, transient and reverse polarity protection. Power-On false pulse suppression is also standard.

### Wire-Break Protection

If the supply wire for a Turck DC sensor was damaged or broken the output will stay in the off state.

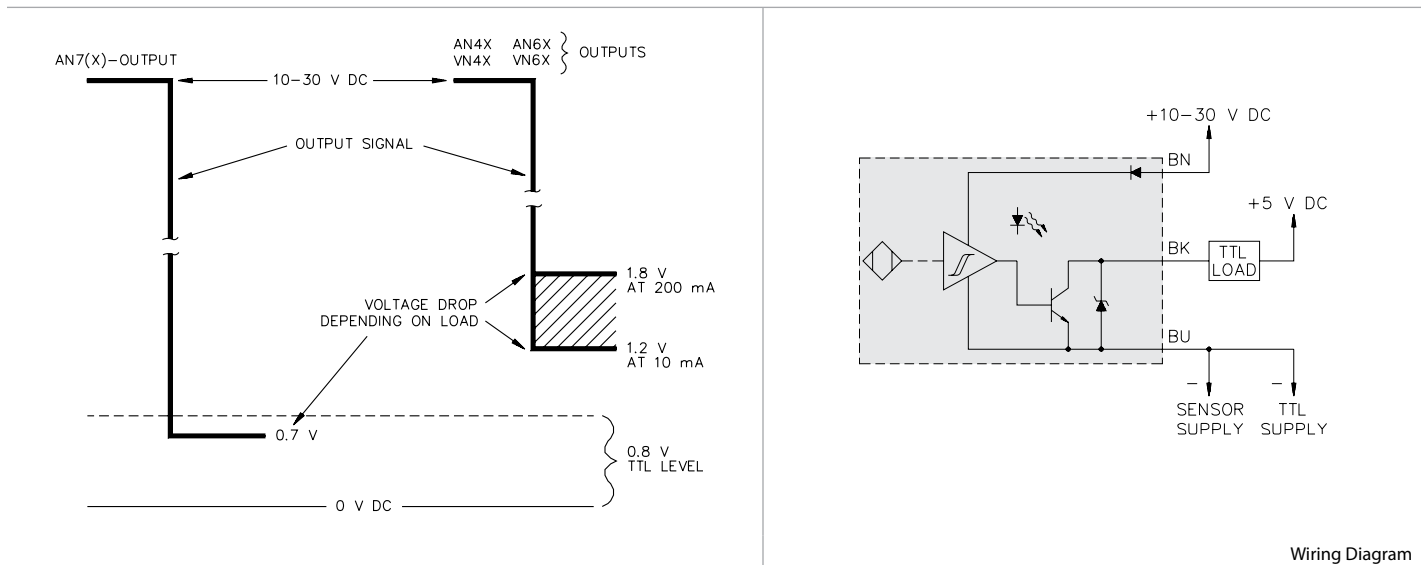

### Short-Circuit and Overload Protection

Turck DC sensors with a Voltage Range designation of "4", "6" or "8" in the part number are short-circuit and overload protected (automatic reset). These sensors incorporate a specially designed circuit which continuously monitors the ON state output current for a short-circuit or overload condition. If either of these fault conditions occurs, the output is turned OFF and pulse tested until the fault is removed. This added protection causes a  $\leq 1.8$  V drop across the output in the normal ON state. This may be a problem when interfacing with some logic low inputs (see TTL compatibility).

### TTL Compatibility

Certain inputs require a 5 VDC signal level to operate correctly. Typically, these types of inputs are described as TTL Level inputs and will only work correctly with a TTL compatible sensor. In order to meet TTL Signal requirements, the output of these sensors will have a voltage drop of  $\leq 0.7$  V (0.3 V typical). Do not use voltage ranges "4" and "6" when TTL compatibility is required. Contact the factory for a list of part numbers with this specification.

We reserve the right to make technical alterations without prior notice.

Wiring Diagram

Voltage drop is measured from output wire black (BK) to ground wire blue (BU).

## DC Outputs

### "LIU" 4-Wire Linear Analog DC Output

Electronic Output Circuit

Wiring Diagram

Typical Response Curve

Linear Analog Output; Current and Voltage

We reserve the right to make technical alterations without prior notice.

## Series/Parallel Connection

### Logic functions with DC proximity sensors:

Self-contained proximity sensors can be wired in series or parallel to perform such logic functions as AND, OR, NAND, NOR. The wiring diagrams show the hook-up of four sensors with NPN and PNP outputs. Take into account the accumulated no-load current and voltage drop per sensor added in the series string.

#### Series-connection:

- N.O. sensors: AND Function  
(target present, all sensors: load "on")
- N.C. sensors: NOR Function  
(target present, any sensor: load "off")

#### Parallel-connection:

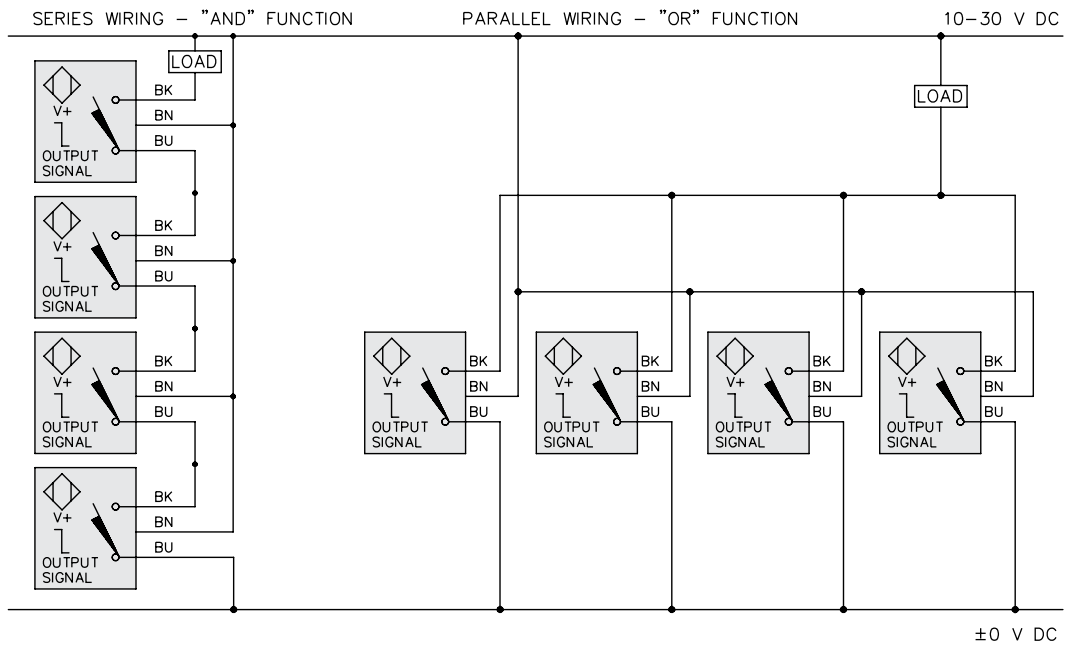

- N.O. sensors: OR Function  
(target present, any sensor: load "on")
- N.C. sensors: NAND Function  
(target present, all sensors: load "off")

### Turck Tip

To prevent the load from seeing the cumulative voltage drop of multiple 3-wire sensors in series, alternating polarity sensors can be used provided that the desired polarity is at the load. Wiring 3-wire sensors in series delays the load by the accumulated "time delay before availability" of all sensors in the string.

Series/Parallel Connection

NPN Connection

PNP Connection

Technical Reference | AC Wiring

**Short-Circuit and Overload Protection**

Turck AC sensors with the Voltage Range designation "30" or "32" are short-circuit and overload protected (manual reset). These sensors incorporate a specially designed circuit which continuously monitors the ON state output current for a short-circuit or overload condition. If either of these fault conditions occurs, the output is latched OFF until the power has been cycled OFF and ON again.

Always select short-circuit and overload protected sensors whenever possible.

**CAUTION!**

**DO NOT** operate an incandescent light bulb as a load. The extremely high cold current will cause an overload condition.

**DO NOT** directly operate a motor with a proximity sensor. The inrush current can cause an overload condition. Always use a motor starter, relay or other appropriate device.

**DO NOT** operate a proximity sensor from a wall outlet without a load. This is considered a "dead" short and can cause catastrophic damage to nonshort-circuit protected sensors.

**DO NOT** forget to ground. AC and AC/DC sensors must be grounded or there exists a potential of electrical shock.

We reserve the right to make technical alterations without prior notice.

**AC and AC/DC Outputs**

These sensors are used as pilot devices for AC-operated loads such as relays, contactors, solenoids, etc. The solid-state output permits use of the sensors directly on the line in series with an appropriate load. They, therefore, replace mechanical limit switches without alteration of circuitry, where operating speed or environmental conditions require the application of solid-state sensors.

These sensors are typically available in a voltage range of 20-250 VAC. All models are available with either normally open (N.O.), normally closed (N.C.) or programmable outputs (from N.O. to N.C.). Careful consideration must be given to the voltage drop across AC/DC sensors when used at 24 VDC.

AC/DC Outputs - "3", "31", "33", non-SCP

Electronic Output Circuit

AC/DC Outputs - "30", "32", SCP

Electronic Output Circuit

## AC and AC/DC Outputs

Electro-Mechanical Equivalents

Since the sensors are connected in series with the load by means of only two leads, an off-state current flows through the load in the magnitude of approximately 1.7 mA.

This, however, does not affect the proper and reliable performance of most AC loads. Another characteristic of solid state sensors is a 5 to 7 volt drop developed across the sensor in the ON state.

All models contain a snubber network to protect against transients from inductive loads, which can cause false triggering.

## Series Connection

### Series-connection:

- N.O. sensors: AND Function (target present, all sensors: load "ON")
- N.C. sensors: NOR Function (target present, any sensor: load "OFF")

The maximum number of sensors to be operated in series depends on the stability of the line voltage and the operating characteristics of the load in question. The supply voltage minus the accumulative on state voltage drop across the series connection (approximately 7 V<sub>rms</sub> per sensor) must be ≥ the minimum required load voltage.

## Mechanical Switches in Series

### Problem:

Mechanical switches in series with proximity sensors should always be avoided because they can create an open circuit, leaving the proximity sensor without power. In order to operate properly, a proximity sensor should be powered continuously. A typical problem encountered when the mechanical contact closes while the target is present is a short time delay that is experienced before the load energizes (time delay before availability).

### Solution:

A 33 kΩ, 1W by-pass resistor can be added across the mechanical contact to eliminate the time delay before availability. This will allow enough leakage current to keep the sensor ready for instantaneous operation.

Technical Reference | AC Wiring

**Parallel Connection**

**Parallel Connection:**  
 N.O. sensors: OR Function  
 (target present, any sensor: load "ON")  
 N.C. sensors: NAND Function  
 (target present, all sensors: load "OFF")

Wiring AC proximity sensors in parallel can result in inconsistent operation and should generally be avoided.

**On-state voltage drop:** With any sensor ON, the voltage across all other sensors is typically 7 Vrms. Since the minimum rated voltage for AC sensors is 20 Vrms, no other sensor with a target present can turn ON until the first sensor turns OFF. This transition is not instantaneous due to the time delay before availability, during which the load may drop out.

**Leakage current through the load:** This is equal to the total leakage of all sensors wired in parallel. Too much leakage into a solid state load can cause the input to turn ON and not turn OFF. Small relays may not drop out if the leakage current exceeds the relay's holding current.

We reserve the right to make technical alterations without prior notice.

**Mechanical Switches in Parallel**

**Problem:**  
 As previously discussed, proximity sensors should be powered continuously to avoid the time delay before availability during power-up.

With mechanical switches in parallel, the sensor is shorted out every time the contact is closed, leaving it without power. If the target is present when the mechanical contact is opened, a small delay will be experienced during which the load may drop out.

**Solution:**  
 This delay can be avoided by adding a resistor in series with the mechanical contact. The voltage drop developed across the resistor with the contact closed will be enough to keep the sensor active. Use the formula below to determine the value and wattage.

**Formula:**

$$R = \frac{\text{minimum operating voltage of proximity sensor}}{\text{load current at operating voltage}}$$

**Example:**

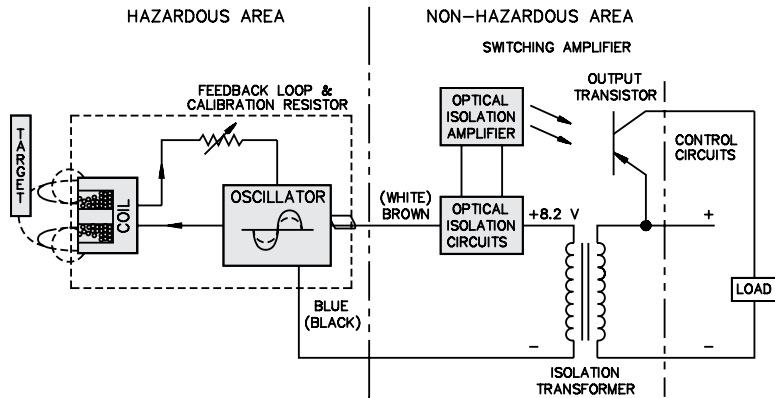

$$R = \frac{20\text{ V}}{180\text{ mA}}$$

$$R = 110\ \Omega$$

Minimum resistor wattage rating:  $E \times I$   
 Example:  $20\text{ V} \times 180\text{ mA} = 3.6\text{ W} \approx 5\text{ watts}$  recommended

**NAMUR (Y0 and Y1) Output**

The NAMUR (Y0 and Y1) sensor behaves like a variable resistor when a target approaches. The impedance increases or decreases between 1 kΩ and 8 kΩ.

NAMUR sensors are 2-wire sensing devices used with switching amplifiers. Because of the small amount of energy needed to operate NAMUR sensors, they can be used in intrinsically safe applications.

The operation of this sensor is similar to that of a variable resistor with a change in impedance as a target approaches the sensor. When no metal is being sensed, the inductive sensor is in a low impedance state and draws a current of more than 2.2 mA. When a metal target enters the high-frequency field radiated from the sensor head, the impedance increases as the target approaches. When fully damped, the sensor draws less than 1.0 mA.

**Note: For capacitive and inductive magnet operated sensors, the current change characteristics are opposite.**

The current differential from the undamped to the damped (metal present) state is used to trigger an amplifier at a defined switching point. These sensors contain a relatively small number of components, which allows the construction of small devices and also assures a high degree of reliability.

In the undamped and damped state, the devices have fairly low impedance and are therefore, unaffected by most transients. NAMUR sensor circuits operate on direct current. Therefore, cable runs of several sensors may be run parallel to one another without mutual interference.

**Typical Output Curves**

**Note:** The typical curve of current versus sensing distance with 8.2 V DC supply and 1 kΩ source impedance. All NAMUR (Y0 and Y1) sensors are calibrated to pass through 1.55 mA at nominal sensing range ±10%.

## Typical Intrinsically Safe Installation

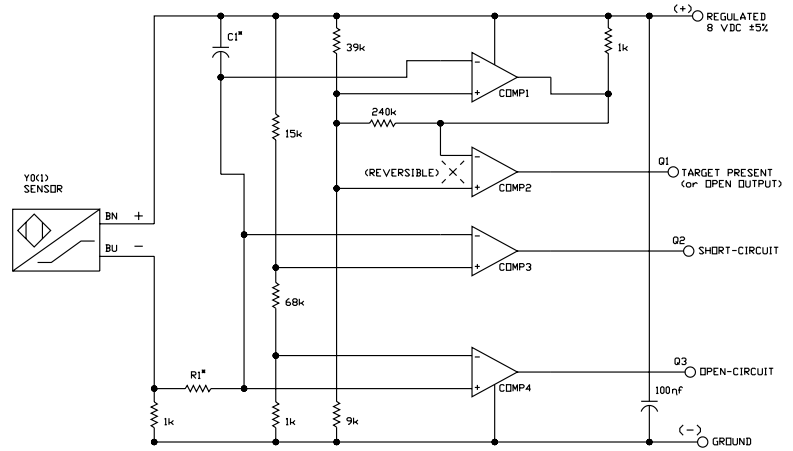

For guidance on installation of Turck intrinsically safe systems, refer to the Instrument Society of America publication ISA-RP12.6-1995, "Wiring Practices for Hazardous (Classified) Locations Instrumentation".

The complete line of Intrinsically Safe and Associated Apparatus can be found on Turck's website.

We reserve the right to make technical alterations without prior notice.

## Custom Interface Circuits

NAMUR sensors can operate outside the nominal operating values when the sensor is used in a nonhazardous area. The supply voltage limits are:  $V_{min} = 5 \text{ VDC}$ ;  $V_{max} = 30 \text{ VDC}$

Within this voltage range the load resistance  $R_i$  must be adjusted for the supply voltage. The following table gives typical values:

$V_{supply} \text{ (DC)}$	$R_i \text{ (k}\Omega\text{)}$	$I_{sn} \text{ (mA)}$	$\Delta I \text{ (mA)}$
5	0.39	$\approx 0.7$	$\approx 0.1$
12	1.8	$\approx 2.3$	$\approx 0.3$
15	2.2	$\approx 2.9$	$\approx 0.4$
24	3.9	$\approx 3.8$	$\approx 0.5$

If these values are used, the current  $I_{sn}$  corresponds to the rated operating distance ( $S_n$ ) of the sensor. NAMUR sensors are short-circuit protected up to 15 VDC and reverse polarity protected up to 10 VDC.

## Technical Reference | Compliances

Third Party Approval and Certification Bodies		
<b>Canadian Standards Association (CSA)</b>	CSA is a Canadian provider of product testing and certification services. CSA certifies products for use in hazardous (classified) locations as well as non-hazardous locations. CSA is accredited by the Standards Council of Canada and is also a US NRTL (Nationally Recognized Test Laboratory), an ATEX Notified Body, and an IECEx ExCB (IECEx Certification Body).	
<b>FM Approvals (FM)</b>	FM approves devices for use in hazardous (classified) locations as well as products in other loss prevention categories. FM is a US NRTL (Nationally Recognized Test Laboratory), an ATEX Notified Body, and an IECEx ExCB (IECEx Certification Body), and is SCC accredited for Canada.	
<b>Underwriters Laboratories (UL)</b>	UL is a US-based provider of product safety testing and certification services for a broad range of both industrial and consumer products. UL lists stand-alone devices, such as sensors, and recognizes system components, such as relays, PWAs, etc. UL is a US NRTL (Nationally Recognized Test Laboratory), an ATEX Notified Body, and an IECEx ExCB (IECEx Certification Body), and is SCC accredited for Canada.	
<b>ATEX</b>	ATEX is the name of the European Union Directive 2014/34/EU covering hazardous location equipment and environments. Product testing and certification is carried out by ATEX Notified Bodies, which are organizations that have been accredited by an EU member state to conduct such testing according to EN Standards.	
<b>IECEx</b>	The IECEx System is the International Electrotechnical Commission's (IEC) system for providing assurance that products meet specified IEC standards. The system aims to provide internationally accepted and standardized certifications. Product testing and certification are carried out by IECEx ExCBs (IECEx Certification Bodies).	
<b>CE</b>	CE marking is a certification mark that indicates conformity with health, safety, and environmental protection standards for products sold within the European Economic Area (EEA).[1] The CE marking is also found on products sold outside the EEA that are manufactured in, or designed to be sold in, the EEA. This makes the CE marking recognizable worldwide even to people who are not familiar with the European Economic Area. It is in that sense similar to the FCC Declaration of Conformity used on certain electronic devices sold in the United States.	
<b>CCC</b>	CCC stands for China Compulsory Certificate Mark and is required for products imported into China as well as products built in China. The CCC Mark was created in 2002 when China joined the World Trade Organization. The CCC applies to a wide range of products. As part of the approval process, product samples are subjected to conformity testing and once approved the manufacture will be subject to regular audits. The approval is required for sensors with operating voltages in excess of 36 volts.	
<b>RoHS</b>	RoHS stands for Restriction of Hazardous Substances. RoHS, also known as Directive 2002/95/EC, originated in the European Union and restricts the use of specific hazardous materials found in electrical and electronic products. All applicable products in the EU market after July 1, 2006 must pass RoHS compliance.	

We reserve the right to make technical alterations without prior notice.

**Note:**

Turck products comply with many International standards. Consult factory for more information.

## Hazardous Location Definitions

### Class/Division Classifications:

<b>Class I</b>	Locations in which flammable gases or vapors exist or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures.
<b>Class II</b>	Locations that are hazardous because of the presence of combustible dust.
<b>Class III</b>	Locations that are hazardous because of the presence of easily ignitable fibers or flyings, but in which such fibers or flyings are not likely to be suspended in the air in quantities sufficient to produce ignitable mixtures.
<b>Division 1</b>	Locations in which hazardous concentrations in the air exist continuously, intermittently, or periodically under normal operating conditions.
<b>Division 2</b>	Locations in which hazardous materials are handled, processed or used, but in which they are normally confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown.
<b>Group A</b>	Atmospheres containing acetylene.
<b>Group B</b>	Atmospheres containing hydrogen, fuel and combustible process gases containing more than 30% hydrogen by volume, or gases or vapors of equivalent hazard such as butadiene, ethylene oxide, propylene oxide and acrolein.
<b>Group C</b>	Atmospheres such as ethyl ether, ethylene, acetaldehyde, cyclopropane, or gases or vapors of equivalent hazard.
<b>Group D</b>	Atmospheres such as acetone, alcohol, ammonia, benzene, butane, cyclopropane, ethylene dichloride, gasoline, hexane, lacquer solvent vapors, methane, natural gas, naphtha, propane, xylene, or gases or vapors of equivalent hazard.
<b>Group E</b>	Atmospheres containing combustible metal dusts, including aluminum, magnesium, and their commercial alloys, and other combustible dusts with similarly hazardous characteristics.
<b>Group F</b>	Atmospheres containing combustible carbonaceous dusts, including carbon black, charcoal and coal.
<b>Group G</b>	Atmospheres containing other combustible dusts, such as chemical, agricultural or plastic dusts.

We reserve the right to make technical alterations without prior notice.

### Class I Zone Classifications:

<b>Zone 0</b>	Locations in which ignitable mixtures exist continuously or for long periods of time.
<b>Zone 1</b>	Locations in which ignitable mixtures are likely to occur during normal operation.
<b>Zone 2</b>	Locations in which ignitable mixtures are not likely to occur during normal operation.
<b>Gas Group IIC</b>	Atmospheres containing acetylene or hydrogen, or gases and vapors of equivalent hazard.
<b>Gas Group IIB</b>	Atmospheres containing ethylene, or gases and vapors of equivalent hazard.
<b>Gas Group IIA</b>	Atmospheres containing propane, or gases and vapors of equivalent hazard.

## Technical Reference | Protection

### Enclosure Ratings

#### NEMA 250-1991

<b>NEMA 1</b>	Enclosures are intended for indoor use primarily to provide a degree of protection against limited amounts of falling dirt.
<b>NEMA 3</b>	Enclosures are intended for outdoor use primarily to provide a degree of protection against rain, sleet, windblown dust, and damage from external ice formation.
<b>NEMA 4</b>	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against windblown dust and rain, splashing water, hose-directed water, and damage from external ice formation.
<b>NEMA 4X</b>	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against corrosion, windblown dust and rain, splashing water, hose-directed water and damage from external ice formation.
<b>NEMA 6</b>	Enclosures are intended for indoor or outdoor use primarily to provide a degree of protection against hose-directed water, the entry of water during occasional temporary submersion at a limited depth, and damage from external ice formation.

#### IEC 529

<b>IP 40</b>	Protection against solid bodies larger than 1 mm. No protection against liquids.
<b>IP 65</b>	Dust tight. Protection against water spray from all directions at 14.2 PSI through a 12.5 mm nozzle.
<b>IP 67</b>	Dust tight. Protection against the effects of immersion in water for 30 minutes at 1 meter.
<b>IP 68</b>	Dust tight. Protection against the effects of indefinite immersion in water at a pressure specified by the manufacturer. Ex. Turck's IP 68 definitions is IP 67 plus. <ul style="list-style-type: none"> <li>■ 24 hours at 70 °C</li> <li>■ 24 hours at -25 °C</li> <li>■ 7 days at 1 meter under water at a constant temperature</li> <li>■ 10 cycles +70 °C and -25 °C, minimum of 1 hour at each temperature</li> </ul>
<b>IP 69K</b>	Hot steam jet cleaning per EN 60529 (IP enclosure ratings) and DIN 40050-9.

We reserve the right to make technical alterations without prior notice.

#### Turck Tip

#### For oily environments

Use plastic sensors with quick disconnects and Turck TPU "/>

#### For washdown environments

Use Turck's Uprox+ Washdown Sensors and appropriate mating cordsets.

## Material Descriptions

### Plastics

<b>ABS - Acrylonitrile-Butadiene-Styrene</b>	Impact resistant, rigid. Resistant to aqueous acids, alkalis, salts, alcohols, oils, concentrated hydrochloric acid; disintegrated by concentrated sulfuric or nitric acids, esters, ketones
<b>CPE, Thermoset (rubber cables)</b>	Excellent resistance to oils, acids, chemicals, ozone, extreme temperatures, cuts, abrasions; flame retardant in welding applications
<b>PA - Polyamide (nylon)</b>	Good mechanical strength, temperature resistant
<b>PA, Amorphous (Trogamid T)</b>	Similar properties to nylon, but transparent. Hard, rigid, good chemical resistance
<b>PA 12-GF30</b>	Nylon 12, 30% glass filled
<b>PA 66-GF25-V0</b>	Nylon 66, 25% glass filled, self-extinguishing
<b>PBT - Polybutylene Terephthalate (when glass reinforced, Crastin®)</b>	Good mechanical strength; resistant to abrasion; resistant to alcohols, oils, some acids, trichloroethylene
<b>PBT-GF30-V0</b>	PBT, 30% glass filled, self-extinguishing
<b>PEI - Polyetherimide (Ultem®)</b>	Excellent resistance to most commercial automotive fluids, fully hydrogenated hydrocarbons, alcohols, weak aqueous solutions. Withstands higher temperatures.
<b>POM - Polyoxymethylene / Polyacetal (Delrin®)</b>	High impact resistance; good mechanical strength; good resistance to oils, alcohols, alkalis, gasoline, xylene, toluene. Dielectric constant 3.7
<b>PP - Polypropylene</b>	Excellent resistance against chemicals including acids, solvents and solutions. High temperature resistance and good mechanical strength
<b>PTFE - Polytetrafluoroethylene</b>	Optimum resistance against high temperature and chemicals; low dielectric constant (2.0)
<b>TPU, Thermoplastic Polyurethane</b>	Elastic, resistant to abrasion, impact-resistant, oil- and grease-tolerant
<b>PVC - Polyvinylchloride</b>	Good mechanical strength, viscosity to impact; resistant to acids, alkalis
<b>PVC, irradiated</b>	Heat and chemical resistant, withstands short-term temperatures to 482° F
<b>PVDF - Polyvinylidene fluoride (Kynar®)</b>	Resistant to high and low temperatures, good resistance to chemicals (similar to PTFE), high mechanical strength
<b>Silicon</b>	For use at high or low ambient temperatures (-50 to +180 °C), moderate mechanical strength, average resistance against alkalis, acids, oils, and solvents
<b>IRPA12 - Irradiated Polyamide (nylon)</b>	Good mechanical strength, temp. resistant
<b>EPTR - Elastomer, Polymer Thermal Plastic</b>	Good fluid resistance
<b>TROG - Trogamid T</b>	Hard, rigid, good chemical resistance

### Metals

<b>AG</b>	Armorguard®
<b>SS</b>	Stainless Steel
<b>CPB</b>	Chrome Plated Brass
<b>CuZn - Brass</b>	Generally good resistance to industrial atmospheres
<b>GD - AISI12 - Aluminum, die-cast</b>	Low specific weight, long-life characteristics
<b>GD - ZnAl4Cu1 (Z410) - Zinc, die-cast</b>	Long-life characteristics
<b>TC</b>	PTFE Coated
<b>WG</b>	Weldguard®
<b>AL</b>	Anodized Aluminum
<b>SF - Stoneface®</b>	High abrasion resistance, excellent for MIG welding applications, high heat and weld flow immunity
<b>TS - Tool Steel</b>	Excellent durability

We reserve the right to make technical alterations without prior notice.

### Maximum Tightening Torque Specifications

The tightening torque should be considered for all threaded sensors to prevent premature failures of sensors due to stresses on the barrel and/or internal electronics. The values below are the absolute maximum ratings and apply only to the mounting hardware provided with each sensor. It is recommended to always allow for tolerances when specifying a tightening torque to prevent accidental over-tightening of the sensor. Liquid thread sealants of an anaerobic base, such as Loctite, are recommended if strong vibrations are likely.

Caution: Sensor barrels are typically brass. Consider break torque when selecting grade of thread sealant.

Barrel Size	Metal Barrel	Plastic Barrel
5 mm	5 Nm (3.7 ft-lb)	----
8 mm	5 Nm (3.7 ft-lb)	----
8 mm (M08 Ferrite)	7 Nm (5.2 ft-lb)	----
12 mm	10 Nm (7.4 ft-lb)	1 Nm (0.7 ft-lb)
18 mm	25 Nm (18 ft-lb)	2 Nm (1.4 ft-lb)
30 mm	75 Nm (55 ft-lb)	5 Nm (3.7 ft-lb)
47 mm	90 Nm (66 ft-lb)	----

## Millimeters Equivalents of Decimals and Fractions

Notes:

1M = 100 cm = 1000 mm

For conversions not given use the following formulas:

Millimeters = Inches x 25.4

Inches = Millimeters ÷ 25.4

We reserve the right to make technical alterations without prior notice.

Technical Reference

## Technical Reference | Glossary

### **Axial Approach**

The approach of the target with its center maintained on the sensor reference axis.

### **Axially Polarized Ring Magnet**

A ring magnet whose poles are the two flat sides of the disk. Mounted on pistons for permaprox® cylinder position sensing through nonmagnetic cylinder walls.

### **Capacitive Proximity Sensor**

A proximity sensor producing an electrostatic field that senses conductive targets and nonconductive materials having a dielectric constant of >1 within its sensing zone.

### **Complementary Output**

Two outputs, one normally open and one normally closed, that can be used simultaneously.

### **Continuous Load Current**

The maximum current allowed to continuously flow through the sensor output in the ON state.

### **Correction Factors**

Percentage of the rated operating distance (Sn) that represents the operating distance for targets constructed from materials other than mild steel (mild steel's correction factor is 1.0).

### **Differential Travel (Hysteresis)**

The difference between the operating point as the target approaches the sensor face, and the release point as the target moves away. Given as a percentage of the operating distance (Sn).

### **Dynamic Output**

A sensor output that stays energized for a set duration of time, independent of the time the target is present (one-shot).

### **Embeddable (Shielded) Proximity Sensor**

A sensor that can be flush-mounted in any material without that material influencing the sensing characteristics.

### **Free Zone**

The space around a proximity sensor that must be kept free of any material capable of affecting the sensing characteristics.

### **Inductive Proximity Sensor**

A proximity sensor producing an electromagnetic field that senses only metal targets within its sensing zone.

### **Inductive Magnet Operated Sensor (Permaprox®)**

A solid-state proximity sensor using inductive technology to detect magnetic fields, giving a switch point output similar to that of an inductive proximity sensor.

### **Inrush Current**

The maximum instantaneous load current that a sensor can tolerate when switching the output. Commonly seen with capacitive loads.

### **IP Rating**

Ingress Protection rating per IEC 529.

### **Lateral Approach**

The approach of a target perpendicular to the sensor reference axis.

### **Load**

A device or circuit that is operated by the energy output of another device such as a proximity sensor.

### **M Threading**

ISO 68 Metric straight threading, designated as "Nominal Size" X "Pitch", in mm. (Ex. M5X0.5)

### **Minimum Load Current**

For 2-Wire sensors, the minimum load current defines the smallest specified current that a sensor requires for reliable operation.

### **NAMUR**

The acronym for a European standards organization.

### **NAMUR Sensor**

A 2-wire variable-resistance DC sensor whose operating characteristics conform to DIN 19 234. Requires a remote amplifier for operation. Typically used for intrinsically safe applications.

### **NEMA Rating**

An enclosure rating per NEMA Standard 250.

### **No-Load Current**

The current drawn by a DC proximity sensor from the power supply when the outputs are not connected to a load.

### **Nonembeddable (Nonshielded) Proximity Sensor**

A sensor is nonembeddable when a specified free zone must be maintained around its sensing face in order not to influence the sensing characteristics.

### **Normally Closed (N.C.)**

The output is OFF when the target is detected by the sensor.

### **Normally Open (N.O.)**

The output is ON when the target is detected by the sensor.

### **NPN Output (Current Sinking)**

A transistor output that switches the common or negative voltage to the load. Load is between sensor and positive supply voltage.

### **NPSM Threading**

American National Standard Straight Pipe Thread for Free-Fitting Mechanical Parts.

### **NPT Threading**

American National Standard Taper Pipe Thread.

## Technical Reference | Glossary

### Off-State (Leakage) Current

The current that flows through the load circuit when the sensor is in the OFF-state. Also known as leakage or residual current.

### Operating Distance

A distance at which the target approaching the sensing face along the reference axis causes the output signal to change.

### PG Threading

Steel conduit threading per German standard DIN 40 430.

### PNP Output (Current Sourcing)

Transistor output that switches the positive voltage to the load. Load is between sensor and common.

### Programmable Output

Sensor output whose N.O. or N.C. function can be selected by means of a jumper or specific terminal connection.

### Radially Polarized Ring Magnet

A ring magnet whose poles are the inner and outer diameter rings.

### Rated Operating Distance (Sn)

A conventional quantity used to designate the operating distance. It does not take into account either manufacturing tolerances or variations due to external conditions such as operating voltage and temperature.

### Reference Axis

An axis perpendicular to the sensing face and passing through its center.

### Repeatability

The deviation in the actual operating distance measured at a constant temperature and voltage over an 8-hour period. It is expressed as a percentage (%) of the rated operating distance (Sn).

### Response frequency

The maximum rate that the output can change in response to the input and still maintain linearity.

### Response Time

The time required for the device switching element to respond after the target enters or exits the sensing zone.

### Reverse Polarity Protection

Internal components that prevent damage to the sensor due to the incorrect connection of the power supply.

### Ripple

The alternating component remaining on a DC signal after rectifying, expressed in percentage of rated voltage.

### Sensing Face

The surface of the proximity sensor through which the electromagnetic (or electrostatic) field emerges.

### Short-Circuit Protection

The ability of a sensor to withstand a shorted condition (no current-limiting load connected) without damage.

### Slew Rate

The rate of change of the output voltage with respect to a step change in input. A change in output of 0 to 10 volts at a slew rate of 1.25 V/ms would take 8 ms to slew to the new value.

### Solid State

Pertains to devices using semiconductors instead of mechanical parts.

### Static Output

A sensor output that stays energized as long as the target is present.

### Switching Frequency

The maximum number of times per second that the sensor can change state (ON and OFF) under ideal conditions, usually expressed in Hertz (Hz).

### Time-Delay Before Availability

The length of time after power is applied to the sensor before it is ready to operate correctly, expressed in milliseconds (ms).

### Uprox Sensor®

An inductive proximity sensor that detects all metals at the same range. Uprox sensors are inherently weld-field immune, operate over a wider temperature range and have a higher switching frequency than standard inductive sensors.

### Uprox+ Sensor®

Same basic characteristics as the Uprox Sensor, but with a redesigned multi coil system which provides increased sensing capabilities. Uprox+ also carries an IP68 environmental rating

### Weld-Field Immunity (WFI)

The ability of a sensor not to false-trigger in the presence of strong magnetic fields typically produced by resistance welders.

### Wire-Break Protection

Results in the output being OFF on a DC sensor if either supply wire is broken.

# Warranty Terms and Conditions

## **RISK OF LOSS**

Delivery of the equipment to a common carrier shall constitute delivery to the Purchaser and the risk of loss shall transfer at that time to Purchaser. Should delivery be delayed due to an act or omission on the part of the Purchaser, risk of loss shall transfer to the Purchaser upon notification by Turck Inc. that the order is complete and ready for shipment.

## **WARRANTIES**

Turck Inc. (hereinafter "Turck") offers five (5) WARRANTIES to cover all products sold. They are as follows:

- 1) The **12-MONTH WARRANTY** is available for the products listed - generally those not covered by **LIFETIME, 5-YEAR, 24-MONTH or 18-MONTH** warranty. No registration required.
- 2) The **18-MONTH WARRANTY** is available for the products listed - generally those not covered by **LIFETIME or 5-YEAR WARRANTY**. No registration is required.
- 3) The **24-MONTH WARRANTY** is available for the products listed - generally those not covered by **LIFETIME, 5-YEAR or 18-MONTH**. No registration is required.
- 4) The **5-YEAR WARRANTY** is available generally for the products listed. No registration is required.
- 5) A **LIFETIME WARRANTY** is available for the products listed. It becomes effective when the accompanying **TURCK LIFETIME WARRANTY REGISTRATION** is completed and returned to Turck.

## **GENERAL TERMS AND CONDITIONS FOR ALL WARRANTIES**

- **12-MONTH STANDARD WARRANTY**
- **18-MONTH STANDARD WARRANTY**
- **24-MONTH STANDARD WARRANTY**
- **5-YEAR WARRANTY**
- **LIFETIME WARRANTY**

Turck warrants the Products covered by the respective WARRANTY AGREEMENTS to be free from defects in material and workmanship under normal and proper usage for the respective time periods listed above from the date of shipment from Turck. In addition, certain specific terms apply to the various WARRANTIES.

**THESE EXPRESS WARRANTIES ARE IN LIEU OF AND EXCLUDE ALL OTHER REPRESENTATIONS MADE - BOTH EXPRESSED AND IMPLIED. THERE ARE NO WARRANTIES OF MERCHANTABILITY OR OF FITNESS FOR A PARTICULAR PURPOSE FOR PRODUCTS COVERED BY THESE TERMS AND CONDITIONS.**

Turck warrants that the goods sold are as described, but no promise, description, affirmation of fact, sample model or representation, oral or written shall be part of an order, unless set forth in these terms and conditions, or are in writing and signed by an authorized representative of Turck. These WARRANTIES do not apply to any Product which has been subject to misuse, negligence, or accident - or to any Product which has been modified or repaired, improperly installed, altered, or disassembled - except according to Turck's written instructions.

These WARRANTIES are subject to the following conditions:

- 1) These WARRANTIES are limited to the electronic and mechanical performance only, as expressly detailed in the Product specifications and NOT to cosmetic performance.
- 2) These WARRANTIES shall not apply to any cables attached to, or integrated with the Product. However, the **18-MONTH WARRANTY** shall apply to cables sold separately by Turck.
- 3) These WARRANTIES shall not apply to any Products which are stored, or utilized, in harsh environmental or electrical conditions outside Turck's written specifications.
- 4) The WARRANTIES are applicable only to Products shipped from Turck subsequent to January 1, 1988.

## **ADDITIONAL SPECIFIC TERMS FOR:**

**(12-MONTH STANDARD WARRANTY) for Linear Displacement Transducers, EZ Track, RFID Products, Draw Wire Assemblies and Slip Rings.**

**(18-MONTH STANDARD WARRANTY) FOR Q-TRACK INDUCTIVE SENSORS, ULTRASONIC SENSORS, FLOW SENSORS, PRESSURE SENSORS, TEMPERATURE SENSORS, INCLINOMETERS, CABLES AND ALL NON-SENSING PRODUCTS SOLD BY TURCK INC. INCLUDING MULTI-SAFE, MULTI-MODUL, MULTI-CART AND RELATED AMPLIFIER PRODUCTS, RELAYS AND TIMERS.**

**(24-MONTH STANDARD WARRANTY) FOR ENCODERS excluding Draw Wire Assemblies.**

**5-YEAR WARRANTY FOR INDUCTIVE AND CAPACITIVE PROXIMITY SENSORS: The periods covered for the above WARRANTIES and Products shall be 12 MONTHS, 18-MONTHS, 24-MONTHS and 5-YEARS, respectively, from the date of shipment from Turck.**

**LIFETIME WARRANTY (OPTIONAL - REGISTRATION REQUIRED) FOR INDUCTIVE, INDUCTIVE MAGNET OPERATED AND CAPACITIVE PROXIMITY SENSORS SOLD TO THE ORIGINAL PURCHASER FOR THE LIFETIME OF THE ORIGINAL APPLICATION.**

# Warranty Terms and Conditions

## **THE FOLLOWING TERMS APPLY TO THE LIFETIME WARRANTY IN ADDITION TO THE GENERAL TERMS:**

- 1) This WARRANTY shall be effective only when the LIFETIME WARRANTY REGISTRATION has been completed, signed by the End User and an authorized Turck Representative or Distributor and has been received by Turck no later than six (6) months after installation in the End User's Plant, or two (2) years from the date product was shipped from Turck, whichever is sooner.
- 2) This warranty is available only to Turck's authorized Representatives, Distributors and to the Original User. (The term "Original User" means that person, firm, or corporation which first uses the Product on a continuous basis in connection with the operation of a production line, piece of machinery, equipment, or similar device.) In the event the ownership of the product is transferred to a person, firm or corporation other than the Original User, this WARRANTY shall terminate.
- 3) This WARRANTY is applicable only to the Original Application. In the event the machinery, equipment, or production line to which the Product is connected, or on which it is installed, is substituted, changed, moved or replaced, the WARRANTY shall terminate.
- 4) This WARRANTY shall be valid only if the Product was purchased by the Original User from Turck, or from an authorized Turck Distributor, or was an integral part of a piece of machinery and equipment obtained by the Original user from an Original Equipment Manufacturer, which itself, was purchased directly from Turck or from an authorized Distributor.

## **PURCHASER'S REMEDIES**

This Remedy shall apply to all WARRANTIES. If a Turck Distributor desires to make a WARRANTY Claim, the Distributor shall, if requested by Turck, ship the Product to Turck's factory in Minneapolis, Minnesota, postage or freight prepaid. If the User desires to make a WARRANTY Claim, they shall notify the authorized Turck Distributor from whom it was purchased or, if such Distributor is unknown, shall notify Turck. Turck shall, at its option, take any of the following two courses of action for any products which Turck determines are defective in materials or workmanship.

- 1) Repair or replace the Product and ship the Product to the Original Purchaser or to the authorized Turck Distributor, postage or freight prepaid; or
- 2) Repay to the Original Purchaser that price paid by the Original Purchaser; provided that if the claim is made under the LIFETIME WARRANTY, and such Product is not then being manufactured by Turck, then the amount to be repaid by Turck to the Original Purchaser shall be reduced according to the following schedule:

<b><u>Number of Years Since Date of Purchase by Original Purchaser</u></b>	<b><u>Percent of Original Purchase Price To Be Paid by Turck</u></b>
10	50%
15	25%
20	10%
More than 20	5%

**PURCHASER'S REMEDIES SHALL BE LIMITED EXCLUSIVELY TO THE RIGHT OF REPLACEMENT, REPAIR OR REPAYMENT AS PROVIDED AND DOES NOT INCLUDE ANY LABOR COST OR REPLACEMENT AT ORIGINAL PURCHASER'S SITE. TURCK SHALL NOT BE LIABLE FOR ANY CONSEQUENTIAL DAMAGES RESULTING FROM ANY BREACH OF ANY WARRANTY, EXPRESSED OR IMPLIED, APPLICABLE TO THE PRODUCT, INCLUDING WITHOUT LIMITATION, ANY DAMAGES RESULTING FROM PROPERTY DAMAGE, PERSONAL INJURY OR BUSINESS INTERRUPTION.**

## **CONSIDER SAFETY AND PROTECTION PRECAUTIONS**

Turck takes great care to design and build reliable and dependable products, however, some products can fail eventually. You must take precautions to design your equipment to prevent property damage and personal injury in the unlikely event of failure. As a matter of policy, Turck does NOT recommend the installation of electronic controls as the sole device FOR THE PROTECTION OF PERSONNEL in connection with power driven presses, brakes, shears and similar equipment and, therefore, the customer should build in redundancy or dual control using approved safety devices for these applications.
