

PRODUCT SPECIFICATION

1. SCOPE

1.1. Content

This specification covers the performance, tests and quality requirements for the AMP\* Tin Plated Non-Bifurcated crimp twin leaf connector assemblies, used to provide a connection method between discrete wiring and printed circuit boards. Contacts are crimp type, snap-in design. These multi-contact connectors have .100, .125 and .156 inch centerline spacing between adjacent contacts.

1.2. Qualification

When tests are performed on the subject product line, the procedures specified in AMP 109 Series specifications shall be used. All inspections shall be performed using the applicable inspection plan and product drawing.

2. APPLICABLE DOCUMENTS

The following documents form a part of this specification to the extent specified herein. In the event of conflict between requirements of this specification and the product drawing, the product drawing shall take precedence. In the event of conflict between the requirements of this specification and the referenced documents, this specification shall take precedence.

2.1. AMP Specifications

- A. 109-1: General Requirements for Test Specifications
- B. 109 Series: Test Specifications as indicated in Figure 1.  
(Comply with MIL-STD-202, MIL-STD-1344 and EIA RS-364)
- C. Corporate Bulletin 76: Cross-reference between AMP Test Specifications and Military or Commercial Documents

2.2. Military Standard

MIL-STD-275: Printed Wiring for Electronic Equipment

### 3. REQUIREMENTS

#### 3.1. Design and Construction

Connectors shall be of the design, construction and physical dimensions specified on the applicable product drawing.

#### 3.2. Materials

- A. Contact: Phosphor bronze, tin plated
- B. Housing Material: Polyester, black

#### 3.3. Ratings

- A. Current: 5 amperes maximum per contact
- B. Operating Temperature: -40° to 85°C

#### 3.4. Performance and Test Description

Connectors shall be designed to meet the electrical, mechanical, and environmental performance requirements specified in Figure 1.

#### 3.5. Test Requirements and Procedures Summary

Test Description	Requirement	Procedure
Examination of Product	Meets requirements of product drawing.	Visual, dimensional, and functional per applicable inspection plan.
<b>ELECTRICAL</b>		
Termination Resistance, Dry Circuit (Low Level)	10 milliohms maximum.	Subject mated contacts assembled in housing to 50 mv open circuit at 100 ma maximum, see Figure 3; AMP Spec 109-6-1.
Dielectric Withstanding Voltage	Altitude, Test Voltage, rms feet    .100cl   .125cl   .156cl Sea Level    1000    1500    1800 50,000    400      525      675 70,000    280      375      450 5 ma leakage maximum.	Test between adjacent contacts of unmated connector assemblies, and contacts to mounting hardware; AMP Spec 109-29-1.

#### 4. QUALITY ASSURANCE PROVISIONS

##### 4.1. Qualification Testing

###### A. Sample Selection

Connector housings and contacts shall be prepared in accordance with applicable Instruction Sheets. They shall be selected at random from current production. Test group 1 and 2 shall consist of three samples of the greatest number of positions of each connector type offered. Two additional specimens shall be selected from the least number of positions offered and tested to Test Group 2. Test group 3 shall consist of 30 contacts of each style and desired wire size. When connectors are required to be mated, mating boards shall conform to Figure 4.

###### B. Test Sequence

Qualification inspection shall be verified by testing samples as specified in Figure 1.

###### C. Acceptance

- (1) Test results from development on pre-qualification samples will be used to determine upper and lower one-sided statistical tolerance limits for 99% reliability at 95% confidence, as follows. Let  $\bar{X}$  and  $s$  denote the sample average and standard deviation, respectively, of the test data. Let  $k$  denote the normal distribution one-sided tolerance factor for 95% confidence and 99% reliability. The value of  $k$  varies with sample size. Values of  $k$  are given in various tables, for example, NBS Handbook 91, Factors for One-Sided Tolerance Limits for Normal Distribution. Suitability of the normal distribution for representing the data shall be verified with normal probability plots, goodness of fit tests, etc.

Then the upper one-sided tolerance limit for 99% reliability at 95% confidence is given by  $\bar{X} + ks$ . The interpretation of this tolerance limit is as follows: based on the test data, and assuming a normal distribution for the test data, we can be 95% confident that 99% of the population of values represented by the sample data will not exceed  $\bar{X} + ks$ . For any test parameter for which there is specified an upper requirement which is not to be exceeded, satisfactory performance of the product is achieved when the value of  $\bar{X} + ks$  does not exceed the requirement value.

The lower one-sided tolerance limit for 95% confidence and 99% reliability is given by  $\bar{X} - ks$ . This has a similar interpretation and corresponding application to lower requirement values.

- (2) Failures attributed to equipment, test setup, or operator deficiencies shall not disqualify the product. When product failure occurs, corrective action shall be taken and samples resubmitted for qualification.

#### 4.2. Requalification Testing

Requalification shall be established by the cognizant divisional engineering function and may consist of all or any part of the overall qualification program provided that it is conducted within the required time period.

#### 4.3. Quality Conformance Inspection

The applicable AMP inspection plan will specify the sampling acceptable quality level to be used. Dimensional and functional requirements shall be in accordance with the applicable product drawing and this specification.

- Notes:
1. Dimensions are in inches.
  2. Unless otherwise specified, tolerance is  $\pm .005$ .
  3. The test card shall extend  $4.00 \pm .02$  from the receptacle after insertion.
  4. Number of contacts shall be the same as on the corresponding printed wiring connector.
  5. Printed circuit test board shall be 2 oz copper and tin/lead over nickel plated per MIL-STD-275.
  6. This dimension shall be the minimum connector card slot length minus .005.
  7. Conductor configuration optional beyond card slot depth.
  8. Printed wiring shall be identical on both sides.

Connector Contact Spacing	A BSC	B
.100	.100	.052
.125	.125	.078
.156	.156	.094
