

#### FEATURES

**44 V supply maximum ratings**  
**±15 V analog signal range**  
**Low on resistance (< 35 Ω)**  
**Ultralow power dissipation (35 μW)**  
**Fast switching times**  
 $t_{ON} < 175 \text{ ns}$   
 $t_{OFF} < 145 \text{ ns}$   
**TTL-/CMOS-compatible**  
**Plug-in replacement for DG411/DG412/DG413**

#### APPLICATIONS

**Audio and video switching**  
**Automatic test equipment**  
**Precision data acquisition**  
**Battery-powered systems**  
**Sample-and-hold systems**  
**Communication systems**

#### GENERAL DESCRIPTION

The ADG411, ADG412, and ADG413 are monolithic CMOS devices comprising four independently selectable switches. They are designed on an enhanced LC<sup>2</sup>MOS process which provides low power dissipation yet gives high switching speed and low on resistance.

The on resistance profile is very flat over the full analog input range ensuring excellent linearity and low distortion when switching audio signals. Fast switching speed coupled with high signal bandwidth also make the parts suitable for video signal switching. CMOS construction ensures ultralow power dissipation, making the parts ideally suited for portable and battery-powered instruments.

The ADG411, ADG412, and ADG413 contain four independent SPST switches. The ADG411 and ADG412 differ only in that the digital control logic is inverted. The ADG411 switches are turned on with a logic low on the appropriate control input, while a logic high is required for the ADG412. The ADG413 has two switches with digital control logic similar to that of the ADG411 while the logic is inverted on the other two switches.

Each switch conducts equally well in both directions when on, and each has an input signal range that extends to the supplies. In the off condition, signal levels up to the supplies are blocked. All switches exhibit break-before-make switching action for use in multiplexer applications. Inherent in the design is low charge injection for minimum transients when switching the digital inputs.

#### PRODUCT HIGHLIGHTS

1. Extended signal range  
The ADG411, ADG412, and ADG413 are fabricated on an enhanced LC<sup>2</sup>MOS, giving an increased signal range which extends fully to the supply rails.
2. Ultralow power dissipation
3. Low  $R_{ON}$
4. Break-before-make switching  
This prevents channel shorting when the switches are configured as a multiplexer.
5. Single-supply operation  
For applications where the analog signal is unipolar, the ADG411, ADG412, and ADG413 can be operated from a single-rail power supply. The parts are fully specified with a single 12 V power supply and remain functional with single supplies as low as 5 V.

<sup>1</sup> Overvoltages at IN, S, or D are clamped by internal diodes. Current should be limited to the maximum ratings given.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those listed in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Only one absolute maximum rating may be applied at any one time.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## TERMINOLOGY

### $R_{ON}$

Ohmic resistance between D and S.

### $I_S$ (OFF)

Source leakage current with the switch OFF.

### $I_D$ (OFF)

Drain leakage current with the switch OFF.

### $I_D, I_S$ (ON)

Channel leakage current with the switch ON.

### $V_D$ ( $V_S$ )

Analog voltage on terminals D, S.

### $C_S$ (OFF)

OFF switch source capacitance.

### $C_D$ (OFF)

OFF switch drain capacitance.

### $C_D, C_S$ (ON)

ON switch capacitance.

### $t_{ON}$

Delay between applying the digital control input and the output switching on.

### $t_{OFF}$

Delay between applying the digital control input and the output switching off.

### $t_D$

OFF time or ON time measured between the 90% points of both switches, when switching from one address state to another.

### Crosstalk

A measure of unwanted signal which is coupled through from one channel to another as a result of parasitic capacitance.

### Off Isolation

A measure of unwanted signal coupling through an OFF switch.

### Charge Injection

A measure of the glitch impulse transferred from the digital input to the analog output during switching.

## APPLICATIONS

Figure 13 illustrates a precise, fast, sample-and-hold circuit. An AD845 is used as the input buffer while the output operational amplifier is an AD711. During the track mode, SW1 is closed and the output  $V_{OUT}$  follows the input signal  $V_{IN}$ . In the hold mode, SW1 is opened and the signal is held by the hold capacitor  $C_H$ .

Due to switch and capacitor leakage, the voltage on the hold capacitor decreases with time. The ADG411/ADG412/ADG413 minimizes this droop due to its low leakage specifications. The droop rate is further minimized by the use of a polystyrene hold capacitor. The droop rate for the circuit shown is typically  $30 \mu\text{V}/\mu\text{s}$ .

A second switch, SW2, which operates in parallel with SW1, is included in this circuit to reduce pedestal error. Since both switches are at the same potential, they have a differential effect on the op amp AD711, which minimizes charge injection effects. Pedestal error is also reduced by the compensation network  $R_C$  and  $C_C$ . This compensation network also reduces

the hold time glitch while optimizing the acquisition time. Using the illustrated op amps and component values, the pedestal error has a maximum value of 5 mV over the  $\pm 10 \text{ V}$  input range. Both the acquisition and settling times are 850 ns.
