

## Serial real-time clock with 44 bytes NVRAM and reset

### Features

- Counters for tenths/hundredths of seconds, seconds, minutes, hours, day, date, month, year, and century
- 32 KHz crystal oscillator integrating load capacitance (12.5 pF) providing exceptional oscillator stability and high crystal series resistance operation
- Serial peripheral interface (2 MHz SPI)
- Ultralow battery supply current of 500 nA (max)
- 2.7 to 5.5 V operating voltage
- 2.5 to 5.5 V oscillator operating voltage
- Battery low flag
- Automatic switchover and deselect circuitry
- 44 bytes of general purpose RAM
- Programmable alarm and interrupt function (valid even during battery backup mode)
- Accurate programmable watchdog timer (from 62.5 ms to 128 s)
- Microprocessor power-on reset
- Choice of power-fail deselect voltages ( $V_{CC} = 2.7$  to  $5.5$  V):
  - $T_{HS} = V_{SS}$ ;  $2.55\text{ V} \leq V_{PFD} \leq 2.70\text{ V}$
  - $T_{HS} = V_{CC}$ ;  $4.20\text{ V} \leq V_{PFD} \leq 4.50\text{ V}$
- Packaging includes a 28-lead SOIC and SNAPHAT® top (to be ordered separately) or 16-lead SOIC
- 28-lead SOIC package provides direct connection for a SNAPHAT® top which contains the battery and crystal
- RoHS compliant
  - Lead-free second level interconnect

SO16 (MQ)

SNAPHAT® (SH)  
battery & crystal

SOH28 (MH)

# 1 Description

The M41T94 is a serial real-time clock with 44 bytes of NVRAM and a RESET output. A built-in 32,768 Hz oscillator (external crystal controlled) and 8 bytes of the SRAM (see [Table 4 on page 18](#)) are used for the clock/calendar function and are configured in binary coded decimal (BCD) format.

An additional 12 bytes of RAM provide status/control of alarm, watchdog and square wave functions. Addresses and data are transferred serially via a serial SPI interface. The built-in address register is incremented automatically after each WRITE or READ data byte. The M41T94 has a built-in power sense circuit which detects power failures and automatically switches to the battery supply when a power failure occurs. The energy needed to sustain the SRAM and clock operations can be supplied by a small lithium button-cell supply when a power failure occurs. Functions available to the user include a non-volatile, time-of-day clock/calendar, alarm interrupts, watchdog timer and programmable square wave output. Other features include a power-on reset as well as two additional debounced inputs ( $\overline{\text{RSTIN1}}$  and  $\overline{\text{RSTIN2}}$ ) which can also generate an output reset ( $\overline{\text{RST}}$ ). The eight clock address locations contain the century, year, month, date, day, hour, minute, second and tenths/hundredths of a second in 24-hour BCD format. Corrections for 28, 29 (leap year - valid until year 2100), 30 and 31 day months are made automatically. The ninth clock address location controls user access to the clock information and also stores the clock software calibration setting.

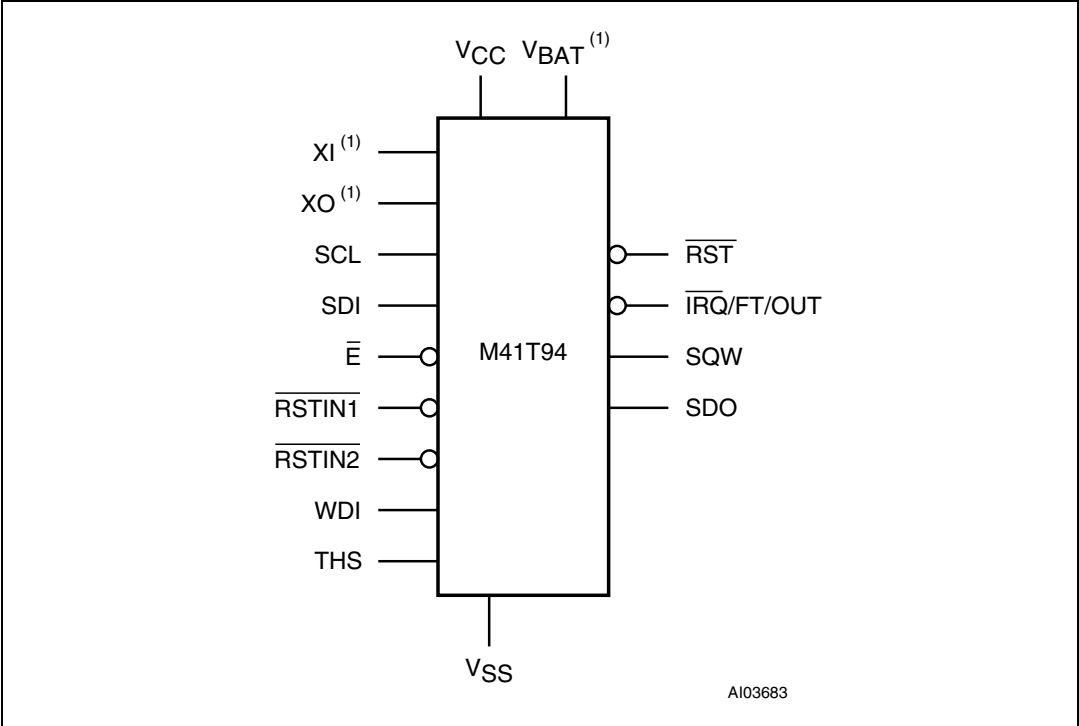

The M41T94 is supplied in either a 16-lead plastic SOIC (requiring user supplied crystal and battery) or a 28-lead SOIC SNAPHAT® package (which integrates both crystal and battery in a single SNAPHAT top). The 28-pin, 330 mil SOIC provides sockets with gold plated contacts at both ends for direct connection to a separate SNAPHAT housing containing the battery and crystal. The unique design allows the SNAPHAT battery/crystal package to be mounted on top of the SOIC package after the completion of the surface mount process.

Insertion of the SNAPHAT housing after reflow prevents potential battery and crystal damage due to the high temperatures required for device surface-mounting. The SNAPHAT housing is also keyed to prevent reverse insertion.

The SOIC and battery/crystal packages are shipped separately in plastic anti-static tubes or in tape & reel form. For the 28-lead SOIC, the battery/crystal package (e.g., SNAPHAT) part number is "M4TXX-BR12SH" (see [Table 21 on page 37](#)).

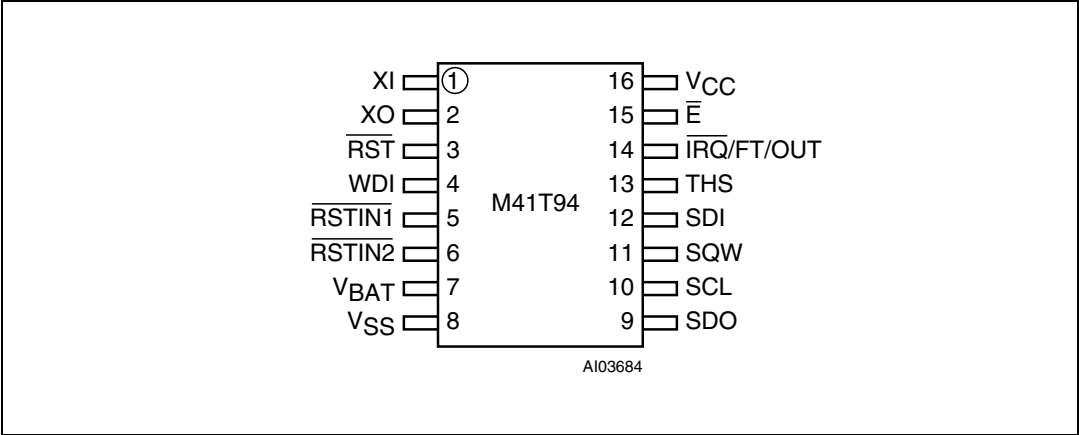

**Caution:** Do not place the SNAPHAT battery/crystal top in conductive foam, as this will drain the lithium button-cell battery.

1. CPOL (clock polarity) and CPHA (clock phase) are bits that may be set in the SPI control register of the MCU.

Table 2.     Function table

| Mode          | $\bar{E}$ | SCL   | SDI            | SDO                                |
|---------------|-----------|---|----------------|------------------------------------|
| Disable reset | H         | Input disabled  | Input disabled | High Z                             |
| WRITE         | L         |  | Data bit latch | High Z                             |
| READ          | L         |  | X              | Next data bit shift <sup>(1)</sup> |

1. SDO remains at High Z until eight bits of data are ready to be shifted out during a READ.

Figure 6.   Data and clock timing

## 2 Signal description

### 2.1 Serial data output (SDO)

The output pin is used to transfer data serially out of the memory. Data is shifted out on the falling edge of the serial clock.

### 2.2 Serial data input (SDI)

The input pin is used to transfer data serially into the device. Instructions, addresses, and the data to be written, are each received this way. Input is latched on the rising edge of the serial clock.

### 2.3 Serial clock (SCL)

The serial clock provides the timing for the serial interface (as shown in [Figure 7 on page 13](#) and [Figure 8 on page 14](#)). The W/R bit, addresses, or data are latched, from the input pin, on the rising edge of the clock input. The output data on the SDO pin changes state after the falling edge of the clock input.

The M41T94 can be driven by a microcontroller with its SPI peripheral running in either of the two following modes:

- (CPOL, CPHA) = ('0', '0') or
- (CPOL, CPHA) = ('1', '1').

For these two modes, input data (SDI) is latched in by the low-to-high transition of clock SCL, and output data (SDO) is shifted out on the high-to-low transition of SCL (see [Table 2 on page 10](#) and [Figure 6 on page 10](#)).

### 2.4 Chip enable ( $\bar{E}$ )

When  $\bar{E}$  is high, the memory device is deselected, and the SDO output pin is held in its high impedance state. After power-on, a high-to-low transition on  $\bar{E}$  is required prior to the start of any operation.

### 3 Operation

The M41T94 clock operates as a slave device on the SPI serial bus. Each memory device is accessed by a simple serial interface that is SPI bus compatible. The bus signals are SCL, SDI and SDO (see [Table 1 on page 8](#) and [Figure 5 on page 9](#)). The device is selected when the chip enable input ( $\overline{E}$ ) is held low. All instructions, addresses and data are shifted serially in and out of the chip. The most significant bit is presented first, with the data input (SDI) sampled on the first rising edge of the clock (SCL) after the chip enable ( $\overline{E}$ ) goes low. The 64 bytes contained in the device can then be accessed sequentially in the following order:

- 1<sup>st</sup> byte: tenths/hundredths of a second register
- 2<sup>nd</sup> byte: seconds register
- 3<sup>rd</sup> byte: minutes register
- 4<sup>th</sup> byte: century/hours register
- 5<sup>th</sup> byte: day register
- 6<sup>th</sup> byte: date register
- 7<sup>th</sup> byte: month register
- 8<sup>th</sup> byte: year register
- 9<sup>th</sup> byte: control register
- 10<sup>th</sup> byte: watchdog register
- 11<sup>th</sup> - 16<sup>th</sup> bytes: Alarm registers
- 17<sup>th</sup> - 19<sup>th</sup> bytes: reserved
- 20<sup>th</sup> byte: square wave register
- 21<sup>st</sup> - 64<sup>th</sup> bytes: user RAM

The M41T94 clock continually monitors  $V_{CC}$  for an out-of tolerance condition. Should  $V_{CC}$  fall below  $V_{PFD}$ , the device terminates an access in progress and resets the device address counter. Inputs to the device will not be recognized at this time to prevent erroneous data from being written to the device from an out-of-tolerance system. When  $V_{CC}$  falls below  $V_{SO}$ , the device automatically switches over to the battery and powers down into an ultra low current mode of operation to conserve battery life. As system power returns and  $V_{CC}$  rises above  $V_{SO}$ , the battery is disconnected, and the power supply is switched to external  $V_{CC}$ .

Write protection continues until  $V_{CC}$  reaches  $V_{PFD}$  (min) plus  $t_{REC}$  (min). For more information on battery storage life refer to application note AN1012.

### 3.1 SPI bus characteristics

The serial peripheral interface (SPI) bus is intended for synchronous communication between different ICs. It consists of four signal lines: serial data input (SDI), serial data output (SDO), serial clock (SCL) and a chip enable ( $\bar{E}$ ).

By definition a device that gives out a message is called “transmitter,” the receiving device that gets the message is called “receiver.” The device that controls the message is called “master.” The devices that are controlled by the master are called “slaves.”

The  $\bar{E}$  input is used to initiate and terminate a data transfer. The SCL input is used to synchronize data transfer between the master (micro) and the slave (M41T94) devices.

The SCL input, which is generated by the microcontroller, is active only during address and data transfer to any device on the SPI bus (see [Figure 5 on page 9](#)).

The M41T94 can be driven by a microcontroller with its SPI peripheral running in either of the two following modes:

- (CPOL, CPHA) = ('0', '0') or
- (CPOL, CPHA) = ('1', '1').

For these two modes, input data (SDI) is latched in by the low-to-high transition of clock SCL, and output data (SDO) is shifted out on the high-to-low transition of SCL (see [Table 2 on page 10](#) and [Figure 6 on page 10](#)).

There is one clock for each bit transferred. Address and data bits are transferred in groups of eight bits. Due to memory size the second most significant address bit is a Don't Care (address bit 6).

**Figure 7. Input timing requirements**

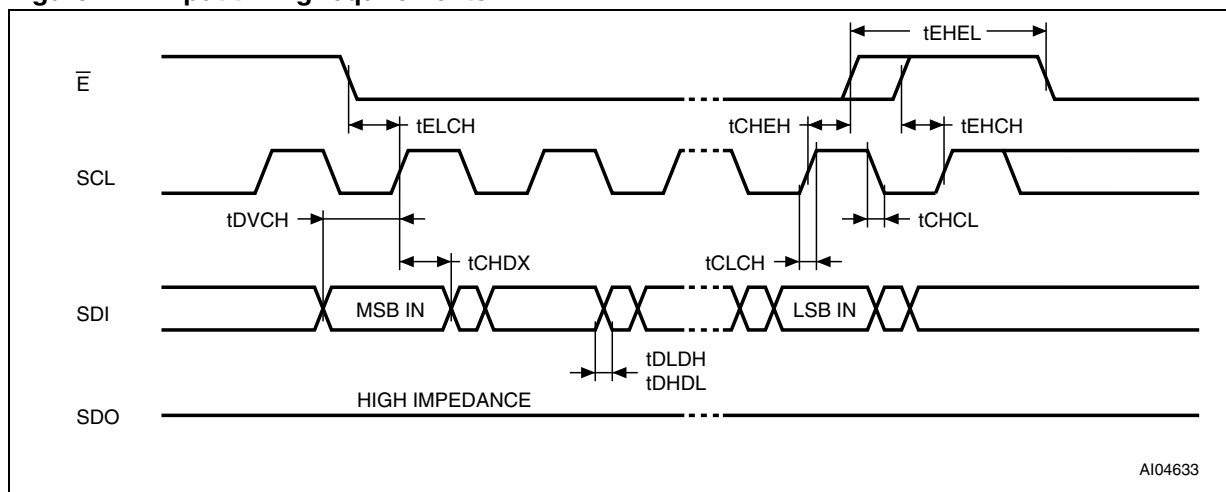

Figure 8. Output timing requirements

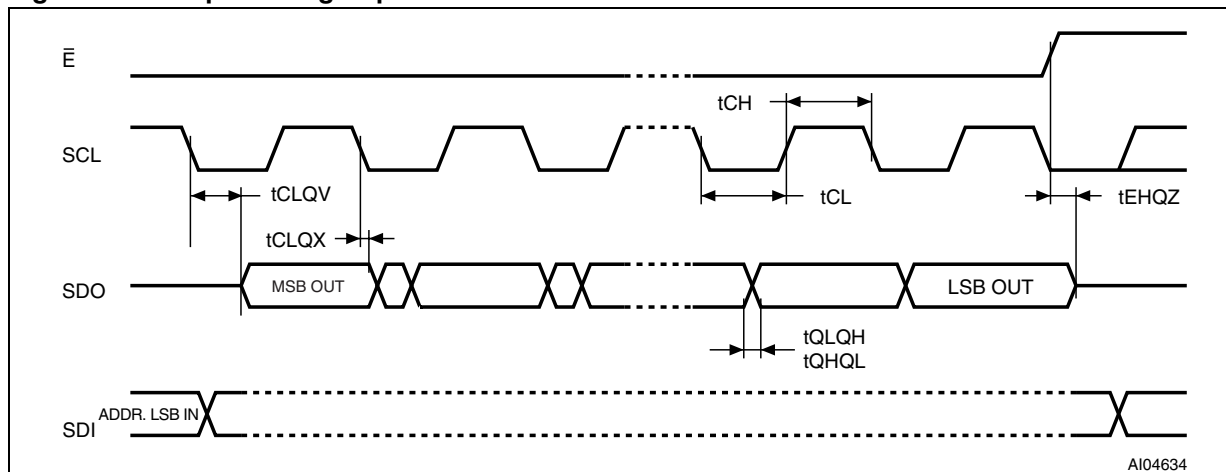

Table 3. AC characteristics

| Symbol           | Parameter <sup>(1)</sup>                         | Min | Max | Unit    |
|------------------|--|-----|-----|---------|
| $f_{SCL}$        | Serial clock input frequency                     | DC  | 2   | MHz     |
| $t_{CH}^{(2)}$   | Clock high                                       | 200 |     | ns      |

| $t_{CHEH}$       | Serial clock input high to chip enable high      | 200 |     | ns      |
| $t_{CL}^{(2)}$   | Clock low  | 200 |     | ns      |
| $t_{CLCH}^{(3)}$ | Clock transition (rise time)                     |     | 1   | $\mu$ s |
| $t_{CLQV}$       | Serial clock input low to output valid           |     | 150 | ns      |
| $t_{CLQX}$       | Serial clock input low to output data transition | 0   |     | ns      |
| $t_{DHDL}^{(3)}$ | Input data transition (fall time)                |     | 1   | $\mu$ s |
| $t_{DLDH}^{(3)}$ | Input data transition (rise time)                |     | 1   | $\mu$ s |
| $t_{DVCH}$       | Input data to serial clock input high            | 40  |     | ns      |
| $t_{EHCH}$       | Chip enable high to serial clock input high      | 200 |     | ns      |
| $t_{EHEL}$       | Chip enable high to chip enable low              | 200 |     | ns      |
| $t_{EHQZ}^{(3)}$ | Chip enable high to output high-z                |     | 250 | ns      |
| $t_{ELCH}$       | Chip enable low to serial clock input high       | 200 |     | ns      |
| $t_{QHQL}^{(3)}$ | Output data transition (fall time)               |     | 100 | ns      |
| $t_{QLQH}^{(3)}$ | Output data transition (rise time)               |     | 100 | ns      |

1. Valid for ambient operating temperature:  $T_A = -40$  to  $85^\circ\text{C}$ ;  $V_{CC} = 2.7$  to  $5.5$  V (except where noted).

2.  $t_{CH} + t_{CL} \geq 1/f_{SCL}$

3. Value guaranteed by design, not 100% tested in production.

### 3.2 Read and write cycles

Address and data are shifted MSB first into the serial data input (SDI) and out of the serial data output (SDO). Any data transfer considers the first bit to define whether a READ or WRITE will occur. This is followed by seven bits defining the address to be read or written. Data is transferred out of the SDO for a READ operation and into the SDI for a WRITE operation. The address is always the second through the eighth bit written after the Enable ( $\overline{E}$ ) pin goes low. If the first bit is a '1,' one or more WRITE cycles will occur. If the first bit is a '0,' one or more READ cycles will occur (see Figure [Figure 9 on page 16](#) and [Figure 10 on page 16](#)).

Data transfers can occur one byte at a time or in multiple byte burst mode, during which the address pointer will be automatically incremented. For a single byte transfer, one byte is read or written and then  $\overline{E}$  is driven high. For a multiple byte transfer all that is required is that  $\overline{E}$  continue to remain low. Under this condition, the address pointer will continue to increment as stated previously. Incrementing will continue until the device is deselected by taking  $\overline{E}$  high. The address will wrap to 00h after incrementing to 3Fh.

The system-to-user transfer of clock data will be halted whenever the address being read is a clock address (00h to 07h). Although the clock continues to maintain the correct time, this will prevent updates of time and date during either a READ or WRITE of these address locations by the user. The update will resume either due to a deselect condition or when the pointer increments to a non-clock or RAM address (08h to 3Fh).

*Note:* This is true both in READ and WRITE mode.

### 3.3 Data retention mode

With valid  $V_{CC}$  applied, the M41T94 can be accessed as described above with READ or WRITE cycles. Should the supply voltage decay, the M41T94 will automatically deselect, write protecting itself when  $V_{CC}$  falls between  $V_{PFD}(\text{max})$  and  $V_{PFD}(\text{min})$  (see [Figure 17 on page 31](#)). At this time, the reset pin ( $\overline{RST}$ ) is driven active and will remain active until  $V_{CC}$  returns to nominal levels. When  $V_{CC}$  falls below the switchover voltage ( $V_{SO}$ ), power input is switched from the  $V_{CC}$  pin to the SNAPHAT battery (or external battery for SO16) at this time, and the clock registers are maintained from the attached battery supply. All outputs become high impedance. On power-up, when  $V_{CC}$  returns to a nominal value, write protection continues for  $t_{REC}$  by internally inhibiting  $\overline{E}$ . The  $\overline{RST}$  signal also remains active during this time (see [Figure 17 on page 31](#)). Before the next active cycle, chip enable should be taken high for at least  $t_{EHL}$ , then low.

For a further more detailed review of battery lifetime calculations, please see application note AN1012.

Figure 9. Read mode sequence

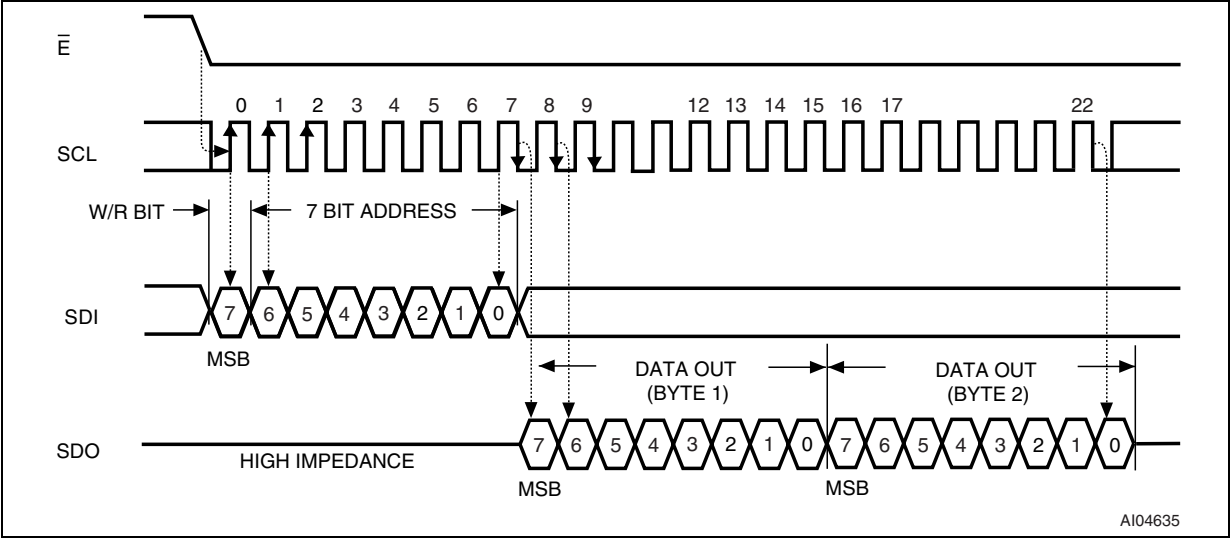

Figure 10. Write mode sequence

## 4 Clock operations

The eight byte clock register (see [Table 4 on page 18](#)) is used to both set the clock and to read the date and time from the clock, in a binary coded decimal format. Tenths/hundredths of seconds, seconds, minutes, and hours are contained within the first four registers. Bits D6 and D7 of clock register 03h (century/hours register) contain the CENTURY ENABLE bit (CEB) and the CENTURY bit (CB). Setting CEB to a '1' will cause CB to toggle, either from '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0,' CB will not toggle. Bits D0 through D2 of register 04h contain the day (day of week). Registers 05h, 06h, and 07h contain the date (day of month), month and years. The ninth clock register is the control register (this is described in the clock calibration section). Bit D7 of register 01h contains the STOP bit (ST). Setting this bit to a '1' will cause the oscillator to stop. If the device is expected to spend a significant amount of time on the shelf, the oscillator may be stopped to reduce current drain. When reset to a '0' the oscillator restarts within one second.

The eight clock registers may be read one byte at a time, or in a sequential block. The control register (address location 08h) may be accessed independently. Provision has been made to assure that a clock update does not occur while any of the eight clock addresses are being read. If a clock address is being read, an update of the clock registers will be halted. This will prevent a transition of data during the READ.

### 4.1 Power-down time-stamp

When a power failure occurs, the halt update bit (HT) will automatically be set to a '1.' This will prevent the clock from updating the clock registers, and will allow the user to read the exact time of the power-down event. Resetting the HT bit to a '0' will allow the clock to update the clock registers with the current time. For more information, see application note AN1572.

### 4.2 Clock registers

The M41T94 offers 20 internal registers which contain clock, alarm, watchdog, flag, square wave and control data (see [Table 4 on page 18](#)). These registers are memory locations which contain external (user accessible) and internal copies of the data (usually referred to as BiPORT™ cells). The external copies are independent of internal functions except that they are updated periodically by the simultaneous transfer of the incremented internal copy. The internal divider (or clock) chain will be reset upon the completion of a WRITE to any clock address.

The system-to-user transfer of clock data will be halted whenever the clock addresses (00h to 07h) are being written. The update will resume either due to a deselect condition or when the pointer increments to a non-clock or RAM address.

Clock and alarm registers store data in BCD. Control, watchdog and square wave registers store data in binary format.

Table 4. Clock register map<sup>(1)</sup>

| Addr |             |                  |            |             |                        |             |     |     | Function/range<br>BCD format |           |

1. Keys:
- S = Sign bit
  - FT = Frequency test bit
  - ST = Stop bit
  - 0 = Must be set to zero
  - BL = Battery low flag (read only)
  - BMB0-BMB4 = Watchdog multiplier bits
  - CEB = Century enable bit
  - CB = Century bit
  - OUT = Output level
  - AFE = Alarm flag enable flag
  - RB0-RB1 = Watchdog resolution bits
  - WDS = Watchdog steering bit
  - ABE = Alarm in battery back-up mode enable bit
  - RPT1-RPT5 = Alarm repeat mode bits
  - WDF = Watchdog flag (read only)
  - WDF = Watchdog flag (read only)
  - AF = Alarm flag (read only)
  - SQWE = Square wave enable
  - RS0-RS3 = SQW frequency
  - HT = Halt update bit
  - TR =  $t_{REC}$  bit

### 4.3 Setting alarm clock registers

Address locations 0Ah-0Eh contain the alarm settings. The alarm can be configured to go off at a prescribed time on a specific month, date, hour, minute, or second, or repeat every year, month, day, hour, minute, or second. It can also be programmed to go off while the M41T94 is in the battery backup to serve as a system wake-up call.

Bits RPT5-RPT1 put the alarm in the repeat mode of operation. [Table 5 on page 19](#) shows the possible configurations. Codes not listed in the table default to the once per second mode to quickly alert the user of an incorrect alarm setting.

When the clock information matches the alarm clock settings based on the match criteria defined by RPT5-RPT1, the AF (alarm flag) is set. If AFE (alarm flag enable) is also set, the alarm condition activates the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin.

**Note:** *If the address pointer is allowed to increment to the flag register address, an alarm condition will not cause the interrupt/flag to occur until the address pointer is moved to a different address. It should also be noted that if the last address written is the "Alarm Seconds," the address pointer will increment to the flag address, causing this situation to occur.*

To disable the alarm, write '0' to the alarm date register and to RPT1–5. The  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  output is cleared by a READ to the flags register. This READ of the flags register will also reset the alarm flag (D6; register 0Fh). See [Figure 11 on page 19](#).

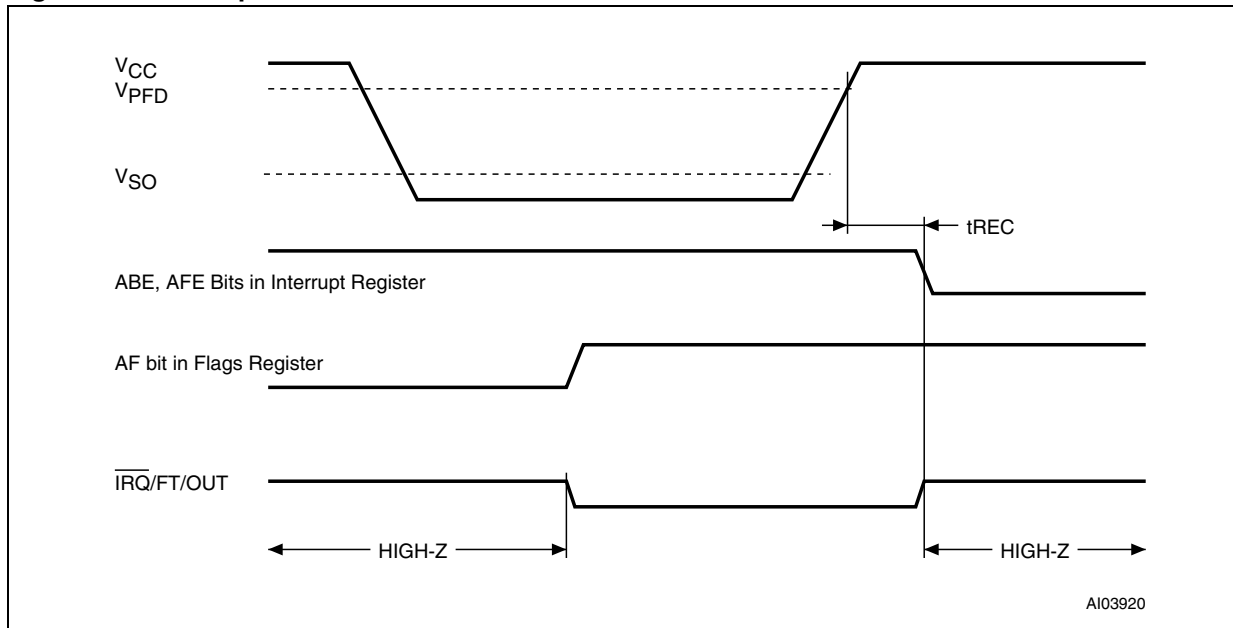

The  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin can also be activated in the battery backup mode. The  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  will go low if an alarm occurs and both ABE (alarm in battery backup mode enable) and AFE are set. The ABE and AFE bits are reset during power-up, therefore an alarm generated during power-up will only set AF. The user can read the flag register at system boot-up to determine if an alarm was generated while the M41T94 was in the deselect mode during power-up. [Figure 12 on page 20](#) illustrates the backup mode alarm timing.

**Table 5. Alarm repeat mode**

| RPT5 | RPT4 | RPT3 | RPT2 | RPT1 | Alarm setting   |
|------|------|------|------|------|-----------------|
| 1    | 1    | 1    | 1    | 1    | Once per second |
| 1    | 1    | 1    | 1    | 0    | Once per minute |
| 1    | 1    | 1    | 0    | 0    | Once per hour   |
| 1    | 1    | 0    | 0    | 0    | Once per day    |
| 1    | 0    | 0    | 0    | 0    | Once per month  |
| 0    | 0    | 0    | 0    | 0    | Once per year   |

**Figure 11. Alarm interrupt reset waveforms**

**Figure 12. Backup mode alarm waveforms**

## 4.4 Watchdog timer

The watchdog timer can be used to detect an out-of-control microprocessor. The user programs the watchdog timer by setting the desired amount of time-out into the Watchdog register, address 09h. bits BMB4-BMB0 store a binary multiplier and the two lower order bits RB1-RB0 select the resolution, where 00 =  $\frac{1}{16}$  second, 01 =  $\frac{1}{4}$  second, 10 = 1 second, and 11 = 4 seconds. The amount of time-out is then determined to be the multiplication of the five-bit multiplier value with the resolution. (For example: writing 00001110 in the Watchdog register =  $3 \times 1$  or 3 seconds).

*Note: Accuracy of timer is within  $\pm$  the selected resolution.*

If the processor does not reset the timer within the specified period, the M41T94 sets the WDF (watchdog flag) and generates a watchdog interrupt or a microprocessor reset. WDF is reset by reading the flags register (0Fh).

The most significant bit of the watchdog register is the watchdog steering bit (WDS). When set to a '0,' the watchdog will activate the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin when timed-out. When WDS is set to a '1,' the watchdog will output a negative pulse on the RST pin for  $t_{\text{REC}}$ . The watchdog register and the AFE, ABE, SQWE, and FT bits will reset to a '0' at the end of a watchdog time-out when the WDS bit is set to a '1.'

The watchdog timer can be reset by two methods:

1. a transition (high-to-low or low-to-high) can be applied to the watchdog input pin (WDI), or
2. the microprocessor can perform a WRITE of the watchdog register.

The time-out period then starts over. The WDI pin should be tied to  $V_{\text{SS}}$  if not used. In order to perform a software reset of the watchdog timer, the original time-out period can be written into the watchdog register, effectively restarting the count-down cycle.

Should the watchdog timer time-out, and the WDS bit is programmed to output an interrupt, a value of 00h needs to be written to the watchdog register in order to clear the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin. This will also disable the watchdog function until it is again programmed correctly. A READ of the flags register will reset the watchdog flag (bit D7; register 0Fh).

The watchdog function is automatically disabled upon power-up and the watchdog register is cleared. If the watchdog function is set to output to the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin and the frequency test (FT) function is activated, the watchdog function prevails and the frequency test function is denied.

## 4.5 Square wave output

The M41T94 offers the user a programmable square wave function which is output on the SQW pin. RS3-RS0 bits located in 13h establish the square wave output frequency. These frequencies are listed in Table [Table 6 on page 22](#). Once the selection of the SQW frequency has been completed, the SQW pin can be turned on and off under software control with the square wave enable bit (SQWE) located in register 0Ah.

**Table 6. Square wave output frequency**

| Square wave bits |     |     |     | Square wave |       |
|------------------|-----|-----|-----|-------------|-------|
| RS3              | RS2 | RS1 | RS0 | Frequency   | Units |
| 0                | 0   | 0   | 0   | None        | –     |
| 0                | 0   | 0   | 1   | 32.768      | kHz   |
| 0                | 0   | 1   | 0   | 8.192       | kHz   |
| 0                | 0   | 1   | 1   | 4.096       | kHz   |
| 0                | 1   | 0   | 0   | 2.048       | kHz   |
| 0                | 1   | 0   | 1   | 1.024       | kHz   |
| 0                | 1   | 1   | 0   | 512         | Hz    |
| 0                | 1   | 1   | 1   | 256         | Hz    |
| 1                | 0   | 0   | 0   | 128         | Hz    |
| 1                | 0   | 0   | 1   | 64          | Hz    |
| 1                | 0   | 1   | 0   | 32          | Hz    |
| 1                | 0   | 1   | 1   | 16          | Hz    |
| 1                | 1   | 0   | 0   | 8           | Hz    |
| 1                | 1   | 0   | 1   | 4           | Hz    |
| 1                | 1   | 1   | 0   | 2           | Hz    |
| 1                | 1   | 1   | 1   | 1           | Hz    |

## 4.6 Power-on reset

The M41T94 continuously monitors  $V_{CC}$ . When  $V_{CC}$  falls to the power fail detect trip point, the  $\overline{RST}$  pulls low (open drain) and remains low on power-up for  $t_{REC}$  after  $V_{CC}$  passes  $V_{PFD}$  (max). The  $\overline{RST}$  pin is an open drain output and an appropriate pull-up resistor should be chosen to control rise time.

## 4.7 Reset inputs ( $\overline{RSTIN1}$ & $\overline{RSTIN2}$ )

The M41T94 provides two independent inputs which can generate an output reset. The duration and function of these resets is identical to a reset generated by a power cycle. [Table 7 on page 23](#) and [Figure 13 on page 23](#) illustrate the AC reset characteristics of this function. Pulses shorter than  $t_{RLRH1}$  and  $t_{RLRH2}$  will not generate a reset condition.  $\overline{RSTIN1}$  and  $\overline{RSTIN2}$  are each internally pulled up to  $V_{CC}$  through a 100 k $\Omega$  resistor.

**Figure 13.  $\overline{\text{RSTIN1}}$  and  $\overline{\text{RSTIN2}}$  timing waveforms**

AI03665

**Table 7. Reset AC characteristics<sup>(1)</sup>**

| Symbol                   | Parameter   | Min | Max | Unit |
|--------------------------|---|-----|-----|------|
| $t_{\text{RLRH1}}^{(2)}$ | $\overline{\text{RSTIN1}}$ low to $\overline{\text{RSTIN1}}$ high | 200 |     | ns   |
| $t_{\text{RLRH2}}^{(3)}$ | $\overline{\text{RSTIN2}}$ low to $\overline{\text{RSTIN2}}$ high | 100 |     | ms   |
| $t_{\text{R1HRH}}^{(4)}$ | $\overline{\text{RSTIN1}}$ high to $\overline{\text{RST}}$ high   | 40  | 200 | ms   |
| $t_{\text{R2HRH}}^{(4)}$ | $\overline{\text{RSTIN2}}$ high to $\overline{\text{RST}}$ high   | 40  | 200 | ms   |

1. Valid for ambient operating temperature:  $T_A = -40$  to  $85^\circ\text{C}$ ;  $V_{\text{CC}} = 2.7$  to  $5.5$  V (except where noted).

2. Pulse width less than 50 ns will result in no RESET (for noise immunity).

3. Pulse width less than 20 ms will result in no RESET (for noise immunity).

4. Programmable (see [Table on page 27](#)).

## 4.8 Calibrating the clock

The M41T94 is driven by a quartz-controlled oscillator with a nominal frequency of 32,768 Hz. Uncalibrated clock accuracy will not exceed  $\pm 35$  ppm (parts per million) oscillator frequency error at  $25^\circ\text{C}$ , which equates to about  $\pm 1.53$  minutes per month. When the Calibration circuit is properly employed, accuracy improves to better than  $\pm 2$  ppm at  $25^\circ\text{C}$ .

The oscillation rate of crystals changes with temperature (see [Figure 14 on page 25](#)). Therefore, the M41T94 design employs periodic counter correction. The calibration circuit adds or subtracts counts from the oscillator divider circuit at the divide by 256 stage, as shown in [Figure 15 on page 25](#). The number of times pulses are blanked (subtracted, negative calibration) or split (added, positive calibration) depends upon the value loaded into the five calibration bits found in the control register. Adding counts speeds the clock up, subtracting counts slows the clock down.

The calibration bits occupy the five lower order bits (D4-D0) in the control register (8h). These bits can be set to represent any value between 0 and 31 in binary form. Bit D5 is a sign bit; '1' indicates positive calibration, '0' indicates negative calibration. Calibration occurs within a 64 minute cycle. The first 62 minutes in the cycle may, once per minute, have one second either shortened by 128 or lengthened by 256 oscillator cycles. If a binary '1' is loaded into the register, only the first 2 minutes in the 64 minute cycle will be modified; if a binary 6 is loaded, the first 12 will be affected, and so on.

Therefore, each calibration step has the effect of adding 512 or subtracting 256 oscillator cycles for every 125,829,120 actual oscillator cycles, that is +4.068 or –2.034 ppm of adjustment per calibration step in the calibration register. Assuming that the oscillator is running at exactly 32,768 Hz, each of the 31 increments in the calibration byte would represent +10.7 or –5.35 seconds per month which corresponds to a total range of +5.5 or –2.75 minutes per month.

Two methods are available for ascertaining how much calibration a given M41T94 may require.

The first involves setting the clock, letting it run for a month and comparing it to a known accurate reference and recording deviation over a fixed period of time. Calibration values, including the number of seconds lost or gained in a given period, can be found in application note AN934: TIMEKEEPER® calibration. This allows the designer to give the end user the ability to calibrate the clock as the environment requires, even if the final product is packaged in a non-user serviceable enclosure. The designer could provide a simple utility that accesses the calibration byte.

The second approach is better suited to a manufacturing environment, and involves the use of the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin. The pin will toggle at 512 Hz, when the stop bit (ST, D7 of 1h) is '0,' the frequency test bit (FT, D6 of 8h) is '1,' the alarm flag enable bit (AFE, D7 of Ah) is '0,' and the watchdog steering bit (WDS, D7 of 9h) is '1' or the watchdog register (9h = 0) is reset.

Any deviation from 512 Hz indicates the degree and direction of oscillator frequency shift at the test temperature. For example, a reading of 512.010124 Hz would indicate a +20 ppm oscillator frequency error, requiring a –10 (XX001010) to be loaded into the calibration byte for correction.

*Note: Setting or changing the calibration byte does not affect the frequency test output frequency.*

The  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin is an open drain output which requires a pull-up resistor for proper operation. A 500 to 10 k $\Omega$  resistor is recommended in order to control the rise time. The FT bit is cleared on power-down.

**Figure 14. Crystal accuracy across temperature****Figure 15. Calibration waveform**

## 4.9 Century bit

Bits D7 and D6 of clock register 03h contain the CENTURY ENABLE bit (CEB) and the CENTURY bit (CB). Setting CEB to a '1' will cause CB to toggle, either from a '0' to '1' or from '1' to '0' at the turn of the century (depending upon its initial state). If CEB is set to a '0,' CB will not toggle.

## 4.10 Output driver pin

When the FT bit, AFE bit and watchdog register are not set, the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin becomes an output driver that reflects the contents of D7 of the control register. In other words, when D7 (OUT bit) and D6 (FT bit) of address location 08h are a '0,' then the  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin will be driven low.

*Note:* The  $\overline{\text{IRQ}}/\text{FT}/\text{OUT}$  pin is an open drain which requires an external pull-up resistor.

## 4.11 Battery low warning

The M41T94 automatically performs battery voltage monitoring upon power-up and at factory-programmed time intervals of approximately 24 hours. The battery low (BL) bit, bit D4 of flags register 0Fh, will be asserted if the battery voltage is found to be less than approximately 2.5 V. The BL bit will remain asserted until completion of battery replacement and subsequent battery low monitoring tests, either during the next power-up sequence or the next scheduled 24-hour interval.

If a battery low is generated during a power-up sequence, this indicates that the battery is below approximately 2.5 volts and may not be able to maintain data integrity in the SRAM. Data should be considered suspect and verified as correct. A fresh battery should be installed.

If a battery low indication is generated during the 24-hour interval check, this indicates that the battery is near end of life. However, data is not compromised due to the fact that a nominal  $V_{CC}$  is supplied. In order to insure data integrity during subsequent periods of battery backup mode, the battery should be replaced. The SNAPHAT<sup>®</sup> top may be replaced while  $V_{CC}$  is applied to the device.

*Note:* This will cause the clock to lose time during the interval the SNAPHAT<sup>®</sup> battery/crystal top is disconnected.

The M41T94 only monitors the battery when a nominal  $V_{CC}$  is applied to the device. Thus applications which require extensive durations in the battery backup mode should be powered-up periodically (at least once every few months) in order for this technique to be beneficial. Additionally, if a battery low is indicated, data integrity should be verified upon power-up via a checksum or other technique.

## 4.12 $t_{REC}$ bit

Bit D7 of clock register 04h contains the  $t_{REC}$  bit (TR).  $t_{REC}$  refers to the automatic continuation of the deselect time after  $V_{CC}$  reaches  $V_{PFD}$ . This allows for a voltage setting time before WRITES may again be performed to the device after a power-down condition. The  $t_{REC}$  bit will allow the user to set the length of this deselect time as defined by [Table 8 on page 27](#).

## 4.13 Initial power-on defaults

Upon initial application of power to the device, the following register bits are set to a '0' state: Watchdog register, TR, FT, AFE, ABE, and SQWE. The following bits are set to a '1' state: ST, OUT, and HT (see [Table 9: Default values](#)).

**Table 8.**  $t_{REC}$  definitions

| $t_{REC}$ bit (TR) | STOP bit (ST) | $t_{REC}$ time |                    | Units |
|--------------------|---------------|----------------|--------------------|-------|
|                    |               | Min            | Max                |       |
| 0                  | 0             | 96             | 98                 | ms    |
| 0                  | 1             | 40             | 200 <sup>(1)</sup> | ms    |
| 1                  | X             | 50             | 2000               | μs    |

1. Default setting

**Table 9.** Default values

| Condition   | TR | ST | HT | Out | FT | AFE | ABE | SQWE | WATCHDOG register <sup>(1)</sup> |
|---|----|----|----|-----|----|-----|-----|------|----------------------------------|
| Initial power-up (battery attach for SNAPHAT®) <sup>(2)</sup> | 0  | 1  | 1  | 1   | 0  | 0   | 0   | 0    | 0                                |
| Subsequent power-up (with battery backup) <sup>(3)</sup>      | UC | UC | 1  | UC  | 0  | 0   | 0   | 0    | 0                                |

1. BMB0-BMB4, RB0, RB1.

2. State of other control bits undefined.

3. UC = Unchanged

## 5 Maximum ratings

Stressing the device above the rating listed in the absolute maximum ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 10. Absolute maximum ratings**

| Symbol                          | Parameter   |          | Value                        | Unit |
|---------------------------------|---|----------|------------------------------|------|
| T <sub>STG</sub>                | Storage temperature (V <sub>CC</sub> off, oscillator off) | SNAPHAT® | –40 to 85                    | °C   |
|                                 |   | SOIC     | –55 to 125                   | °C   |
| V <sub>CC</sub>                 | Supply voltage  |          | –0.3 to 7                    | V    |
| T <sub>SLD</sub> <sup>(1)</sup> | Lead solder temperature for 10 seconds                    |          | 260                          | °C   |
| V <sub>IO</sub>                 | Input or output voltage                                   |          | –0.3 to V <sub>CC</sub> +0.3 | V    |
| I <sub>O</sub>                  | Output current  |          | 20                           | mA   |
| P <sub>D</sub>                  | Power dissipation   |          | 1                            | W    |

1. For SO16 and SOH28 package, lead-free (Pb-free) lead finish: reflow at peak temperature of 260°C (the time above 255°C must not exceed 30 seconds).

**Caution:** *Negative undershoots below –0.3 V are not allowed on any pin while in the battery backup mode.*

**Caution:** *Do NOT wave solder SOIC to avoid damaging SNAPHAT® sockets.*

## 6 DC and AC parameters

This section summarizes the operating and measurement conditions, as well as the DC and AC characteristics of the device. The parameters in the following DC and AC characteristic tables are derived from tests performed under the measurement conditions listed in the relevant tables. Designers should check that the operating conditions in their projects match the measurement conditions when using the quoted parameters.

**Table 11. DC and AC measurement conditions<sup>(1)</sup>**

| Parameter                             | M41T94              |
|---------------------------------------|---------------------|
| $V_{CC}$ supply voltage               | 2.7 to 5.5 V        |
| Ambient operating temperature         | −40 to 85°C         |
| Load capacitance ( $C_L$ )            | 100 pF              |
| Input rise and fall times             | ≤ 50 ns             |
| Input pulse voltages                  | 0.2 to 0.8 $V_{CC}$ |
| Input and output timing ref. voltages | 0.3 to 0.7 $V_{CC}$ |

1. Output Hi-Z is defined as the point where data is no longer driven.

**Figure 16. AC testing input/output waveforms**

**Table 12. Capacitance**

| Symbol          | Parameter <sup>(1)(2)</sup>                       | Min | Max | Unit |
|-----------------|---|-----|-----|------|
| $C_{IN}$        | Input capacitance                                 |     | 7   | pF   |
| $C_{OUT}^{(3)}$ | Output capacitance                                |     | 10  | pF   |
| $t_{LP}$        | Low-pass filter input time constant (SDA and SCL) |     | 50  | ns   |

1. Effective capacitance measured with power supply at 5 V; sampled only, not 100% tested.

2. At 25°C,  $f = 1$  MHz.

3. Outputs are deselected.

Table 13. DC characteristics

| Symb.                          | Parameter                                      | Test condition <sup>(1)</sup>   | Min                | Typ  | Max                   | Unit |
|--------------------------------|--|---|--------------------|------|-----------------------|------|
| I <sub>BAT</sub>               | Battery current OSC on                         | T <sub>A</sub> = 25°C, V <sub>CC</sub> = 0 V,<br>V <sub>BAT</sub> = 3 V |                    | 400  | 500                   | nA   |

| V <sub>IL</sub>                | Input low voltage                              |   | –0.3               |      | 0.3V <sub>CC</sub>    | V    |
| V <sub>BAT</sub>               | Battery voltage                                |   | 2.5                |      | 3.5 <sup>(4)</sup>    | V    |
| V <sub>OH</sub>                | Output high voltage <sup>(5)</sup>             | I <sub>OH</sub> = –1.0 mA   | 2.4                |      |                       | V    |
| V <sub>OL</sub>                | Output low voltage <sup>(5)</sup>              | I <sub>OL</sub> = 3.0 mA  |                    |      | 0.4                   | V    |
|                                | Output low voltage (open drain) <sup>(6)</sup> | I <sub>OL</sub> = 10 mA   |                    |      | 0.4                   |      |
|                                | Pull-up supply voltage (open drain)            | $\overline{\text{RST}}$ , $\overline{\text{IRQ}}$ /FT/OUT               |                    |      | 5.5                   | V    |
| V <sub>PFD</sub>               | Power fail deselect (THS = V <sub>CC</sub> )   |   | 4.20               | 4.40 | 4.50                  | V    |
|                                | Power fail deselect (THS = V <sub>SS</sub> )   |   | 2.55               | 2.60 | 2.70                  |      |
| V <sub>SO</sub>                | Battery backup switchover                      |   |                    | 2.5  |                       | V    |

- Valid for ambient operating temperature: T<sub>A</sub> = –40 to 85°C; V<sub>CC</sub> = 2.7 to 5.5 V (except where noted).
- $\overline{\text{RSTIN1}}$  and  $\overline{\text{RSTIN2}}$  internally pulled up to V<sub>CC</sub> through 100 KΩ resistor. WDI internally pulled-down to V<sub>SS</sub> through 100 KΩ resistor.
- Outputs deselected.
- For rechargeable back-up, V<sub>BAT</sub> (max) may be considered V<sub>CC</sub>.
- For SQW pin (CMOS).
- For  $\overline{\text{IRQ}}$ /FT/OUT,  $\overline{\text{RST}}$  pins (open drain): if pulled up to supply other than V<sub>CC</sub>, this supply must be equal to, or less than 3.0 V when V<sub>CC</sub> = 0 V (during battery backup mode).

Table 14. Crystal electrical characteristics (externally supplied)

| Symbol         | Parameter <sup>(1)(2)</sup> | Typ    | Min | Max | Unit |
|----------------|-----------------------------|--------|-----|-----|------|
| f <sub>0</sub> | Resonant frequency          | 32.768 |     |     | kHz  |
| R <sub>S</sub> | Series resistance           |        |     | 50  | kΩ   |
| C <sub>L</sub> | Load capacitance            | 12.5   |     |     | pF   |

- Load capacitors are integrated within the M41T94. Circuit board layout considerations for the 32.768 kHz crystal of minimum trace lengths and isolation from RF generating signals should be taken into account. These characteristics are externally supplied.
- STMicroelectronics recommends the KDS DT-38: 1TA/1TC252E127, Tuning Fork Type (thru-hole) or the DMX-26S: 1TJS125FH2A212, (SMD) quartz crystal for industrial temperature operations. For contact information on this crystal type, see [Section 10: References on page 39](#).

Figure 17. Power down/up mode AC waveforms

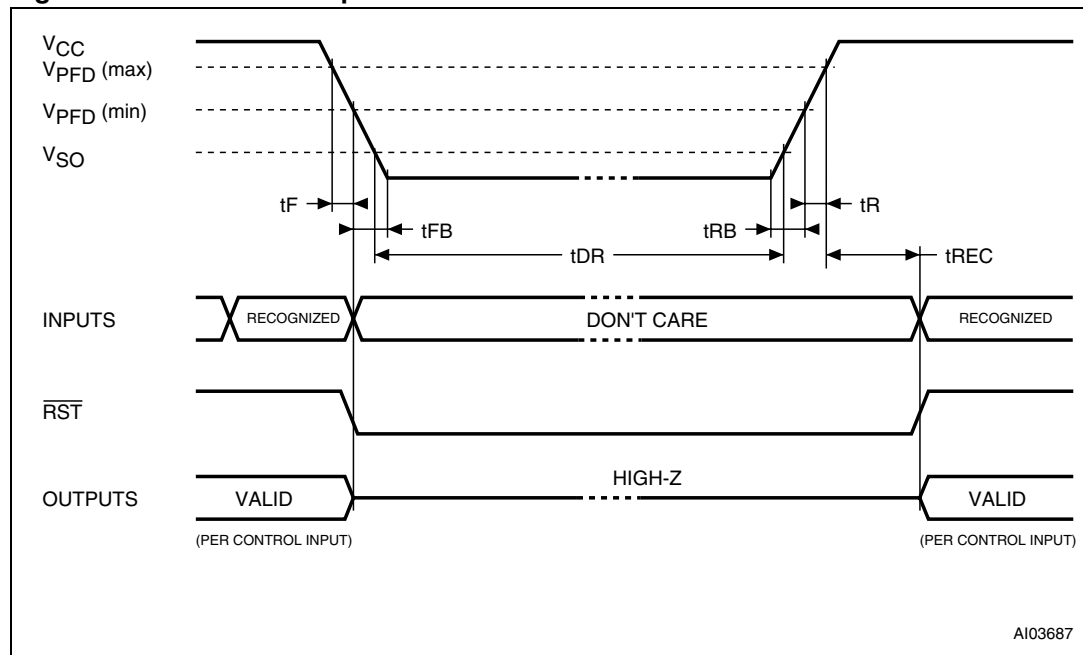

Table 15. Power down/up AC characteristics

| Symbol          | Parameter <sup>(1)</sup>                              | Min        | Typ | Max | Unit    |
|-----------------|---|------------|-----|-----|---------|
| $t_F^{(2)}$     | $V_{PFD} (max)$ to $V_{PFD} (min)$ $V_{CC}$ fall time | 300        |     |     | $\mu s$ |
| $t_{FB}^{(3)}$  | $V_{PFD} (min)$ to $V_{SS}$ $V_{CC}$ fall time        | 10         |     |     | $\mu s$ |
| $t_R$           | $V_{PFD} (min)$ to $V_{PFD} (max)$ $V_{CC}$ rise time | 10         |     |     | $\mu s$ |
| $t_{RB}$        | $V_{SS}$ to $V_{PFD} (min)$ $V_{CC}$ rise time        | 1          |     |     | $\mu s$ |
| $t_{REC}^{(4)}$ | Power up deselect time                                | 40         |     | 200 | ms      |
| $t_{DR}$        | Expected data retention time                          | $10^{(5)}$ |     |     | YEARS   |

- Valid for ambient operating temperature:  $T_A = -40$  to  $85^\circ C$ ;  $V_{CC} = 2.7$  to  $5.5$  V (except where noted).
- $V_{PFD} (max)$  to  $V_{PFD} (min)$  fall time of less than  $t_F$  may result in deselection/write protection not occurring until  $200 \mu s$  after  $V_{CC}$  passes  $V_{PFD} (min)$ .
- $V_{PFD} (min)$  to  $V_{SS}$  fall time of less than  $t_{FB}$  may cause corruption of RAM data.
- Programmable (see [Table 8 on page 27](#)).
- At  $25^\circ C$ ,  $V_{CC} = 0$  V (when using SOH28 + M4T28-BR12SH SNAPHAT<sup>®</sup> top).

## 7 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK® is an ST trademark.

## 8 Part numbering

**Table 20. Ordering information scheme**

|   |      |    |    |   |   |
|---|------|----|----|---|---|
| Example:  | M41T | 94 | MH | 6 | E |
| <b>Device type</b>  |      |    |    |   |   |
| M41T  |      |    |    |   |   |
| <b>Supply voltage and write protect voltage</b>   |      |    |    |   |   |
| 94 = $V_{CC} = 2.7$ to $5.5$ V  |      |    |    |   |   |
| THS = $V_{CC}$ ; $4.20$ V $\leq V_{PFD} \leq 4.50$ V  |      |    |    |   |   |
| THS = $V_{SS}$ ; $2.55$ V $\leq V_{PFD} \leq 2.70$ V  |      |    |    |   |   |
| <b>Package</b>  |      |    |    |   |   |
| MQ = SO16   |      |    |    |   |   |
| MH <sup>(1)</sup> = SOH28   |      |    |    |   |   |
| <b>Temperature range</b>  |      |    |    |   |   |
| 6 = $-40$ to $85^{\circ}\text{C}$   |      |    |    |   |   |
| <b>Shipping method</b>  |      |    |    |   |   |
| E = Lead-free package (ECOPACK <sup>®</sup> ), tubes  |      |    |    |   |   |
| F = Lead-free package (ECOPACK <sup>®</sup> ), tape & reel  |      |    |    |   |   |
| 1. The 28-pin SOIC package (SOH28) requires the SNAPHAT <sup>®</sup> battery/crystal package which is ordered separately under the part number "M4TXX-BR12SHX" in plastic tube or "M4TXX-BR12SHXTR" in tape & reel form (see Table <a href="#">Table 21 on page 37</a> ). |      |    |    |   |   |

**Caution:** Do not place the SNAPHAT<sup>®</sup> battery package "M4TXX-BR12SH" in conductive foam as it will drain the lithium button-cell battery.

For other options, or for more information on any aspect of this device, please contact the ST sales office nearest you.

**Table 21. SNAPHAT<sup>®</sup> battery table**

| Part number   | Description  | Package |
|---------------|--|---------|
| M4T28-BR12SH1 | Lithium battery (48 mAh) and crystal SNAPHAT <sup>®</sup>  | SH      |
| M4T32-BR12SHx | Lithium battery (120 mAh) and crystal SNAPHAT <sup>®</sup> | SH      |

## 9 Environmental information

Figure 22. Recycling symbols

This product contains a non-rechargeable lithium (lithium carbon monofluoride chemistry) button cell battery fully encapsulated in the final product.

Recycle or dispose of batteries in accordance with the battery manufacturer's instructions and local/national disposal and recycling regulations.

Please refer to the following web site address for additional information regarding compliance statements and waste recycling.

Go to [www.st.com/rtc](http://www.st.com/rtc), then select "Lithium Battery Recycling" from "Related Topics".

# 11 Revision history

**Table 22. Document revision history**

| Date        | Revision | Changes   |
|-------------|----------|---|
| Apr-2002    | 1        | First edition   |
| 25-Apr-2002 | 1.1      | Adjust graphic ( <a href="#">Figure 4 on page 9</a> ); fix table text ( <a href="#">Table 10 on page 28</a> , <a href="#">Table 20 on page 37</a> ); adjust characteristics ( <a href="#">Table 13 on page 30</a> , <a href="#">Table 14 on page 30</a> )   |
| 03-Jul-2002 | 1.2      | Modify DC, Crystal Electrical Characteristics footnotes, Default Value table ( <a href="#">Table 13 on page 30</a> , <a href="#">Table 14 on page 30</a> , <a href="#">Table 9 on page 27</a> )   |
| 06-Nov-2002 | 1.3      | Correct dimensions ( <a href="#">Table 19 on page 36</a> )  |
| 26-Mar-2003 | 1.4      | Update test condition ( <a href="#">Table 15 on page 31</a> )   |
| 28-Apr-2003 | 2        | New Si changes ( <a href="#">Figure 4 on page 9</a> ; <a href="#">Table 15 on page 31</a> , <a href="#">Table 7 on page 23</a> , <a href="#">Table 8 on page 27</a> , <a href="#">Table 9 on page 27</a> )  |
| 15-Jun-2004 | 3        | Reformatted; added Lead-free information; update characteristics ( <a href="#">Figure 14 on page 25</a> ; <a href="#">Table 10 on page 28</a> , <a href="#">Table 13 on page 30</a> , <a href="#">Table 20 on page 37</a> )   |
| 29-Aug-2006 | 4        | Changed document to new template; amalgamated diagrams in <a href="#">Features on page 1</a> ; updated Package mechanical data in <a href="#">Section 7: Package mechanical data</a> ; small text changes for entire document, ECOPACK compliant  |
| 09-Nov-2007 | 5        | Added lead-free second level interconnect information to cover page and <a href="#">Section 7: Package mechanical data</a> ; minor formatting changes throughout document; updated <a href="#">Table 10</a> , footnote 1 in <a href="#">Table 14</a> , <a href="#">Table 20</a> , <a href="#">21</a> ; addition of <a href="#">Section 10: References</a> . |
| 13-Jan-2009 | 6        | Updated <a href="#">Table 10</a> ; updated text in <a href="#">Section 7: Package mechanical data</a> ; added <a href="#">Section 9: Environmental information</a> .  |

**Please Read Carefully:**

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

**UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.**

**UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.**

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
