## MPEG 2.5 LAYER III AUDIO DECODER

- SINGLE CHIP MPEG2 LAYER 3 DECODER SUPPORTING:
  - All features specified for Layer III in ISO/IEC 11172-3 (MPEG 1 Audio) except 44.1KHz Audio
  - All features specified for Layer III 2 channels in ISO/IEC13818-3.2 (MPEG 2 Audio) except 22.05KHz Audio
  - Lower sampling frequencies syntax extension, (not specified by ISO) called MPEG 2.5 except 11.025KHz Audio
- DECODES LAYER III STEREO CHANNELS, DUAL CHANNEL, SINGLE CHANNEL (MONO)
- SUPPORTING THE MPEG 1 & 2 SAMPLING FREQUENCIES AND THE EXTENSION TO MPEG 2.5:

48, 32, 24, 16, 12, 8 KHz

- ACCEPTS MPEG 2.5 LAYER III ELEMENTARY COMPRESSED BITSTREAM WITH DATA RATE FROM 8 Kbit/s UP TO 128 Kbit/s
- DIGITAL VOLUME CONTROL
- DIGITAL BASS & TREBLE CONTLC!
- SERIAL BITSTREAM INPUT INTERFACE
- ANCILLARY DATA EXTRACTION VIA I<sup>2</sup>C INTERFACE.
- SERIAL PCM OU. PUT INTERFACE (I<sup>2</sup>S AND OTHER FORMATS)
- PLL FOP IN ERNAL CLOCK AND FOR OUTPUT PCM CLOCK GENERATION
- CW POWER DATA ELABORATION FOR POWER CONSUMPTION OPTIMISATION
- CRC CHECK AND SYNCHRONISATION ERROR DETECTION WITH SOFTWARE INDICATORS
- I<sup>2</sup>C CONTROL BUS
- LOW POWER 3.3V CMOS TECHNOLOGY

■ 14.72MHz EXTERNAL INPUT CLOCK OR BUILT-IN XTAL OSCILLAT OR

#### APPLICATIONS

STARMAN SATELLITE RADIO RECEIVER

#### DESCRIPTION

The STA003T is a fully integrated high flexibility MPEG Layer III Audio Decoder, capable of decoding Layer III compressed elementary streams, as specified in MPEG 1 and MPEG 2 ISO standards.

The device decodes also elementary streams compressed by using low sampling rates, as specified by MPEG 2.5.

STA003T receives the input data through a Serial Input Interface.

The decoded signal is a stereo, mono, or dual channel digital output that can be sent directly to a D/A converter, by the PCM Output Interface.

This interface is software programmable to adapt the STA003T digital output to the most common DACs architectures used on the market.

The functional STA003T chip partitioning is described in fig. 1.

Other Outputs	100µA	100μΑ	100pF	1.5V			

#### 2.0 FUNCTIONAL DESCRIPTION

#### 2.1 Clock Signal

The STA003T input clock is derivated from an external ource or from a 14.72 MHz crystal. XTI is an input Pad with specific levels.

Symbol	Parameter	Test Condition	Min.	Тур.	Max.	Unit
VIL	Low Level Input Voltage				V <sub>DD</sub> -1.8	V
V <sub>IH</sub>	High Level Input Voltage		V <sub>DD</sub> -0.8			V

#### **CMOS** compatibility

The XTI pad low and high levels are CMOS compatible; XTI pad noise margin is better than typical CMOS pads.

#### TTL compatibility

The XTI pad low level is compatible with TTL while the high level is not compatible (for example if  $V_{DD}$  = 3V TTL min high level = 2.0V while XTI min high level = 2.2V)

#### Figure 4. MPEG Decoder Interfaces.

Figure 5. Serial Input Interface Clocks

#### 2.2 Serial Input Interface

STA003T receives the input data thought the Serial Input Interface (Fig.4). It is a serial communication interface connected to the SDI (Serial Data Input) and SCKR (Receiver Serial Clock).

The interface can be configured to receive data sampled on both rising and falling edge of the SCKR clock.The BIT\_EN pin, when set to low, forces the bitstream input interface to ignore the incoming data. The possible configurations are described in Fig. 5. The bitstream must be sent MSB first to STA003T.

#### 2.3 PLL & Clocks Generation System

The STA003T has a clock generation system that is used by the device core to adjust the core speed, for power saving, adapting the processing speed to the needs of the decoded audio program. The clocks generation system is even used to generate all the PCM output interface clocks:

#### SCKT, LRCKT, and OCLK.

The block diagram in Fig. 6 is a description of STA003T clocks generation system. The input of STA003T clocks system is a 14.72MHz input clock. Internally it is composed by a PLL loop, and the VCO output is fed into a divider stage, used to program the Core speed and the PCM interface clocks. Several registers are programmed by the Layer III decoder core, and by the user, when a specific interface configuration is required.

The PLL can be programmed by a set of registers, as described in the I<sup>2</sup>C Registers section, The partic-

**47**/

6/39

ularity of the STA003T clocks generation system is the possibility to modify the Audio Sampling Frequency (LRCKT) in steps of few ppm to compensate dynamically the audio sampling rate offset between the receiver and the broadcasting station.

The compensation is done by the STA003T core without requiring interaction with the application controller and the sampling rate compensation produces a jittering effect outside the audible range.

The device implements a sampling rate offset control receiving by STA002 (WorldSpace Channel Decoder) a dedicated signal every decoded Broadcast Channel Frame (432ms).

This signal is used as interrupt signal inside STA003T. Within a WorldSpace Broadcast Frame, there are a fixed number of PCM samples, depending on the nominal audio sampling rate (Fig. 7).

Using this information, with the SRC\_INT signal as external timer source, STA003T performs the compensation of the audio sampling rate.

The sampling rate control is done by the STA003T core, by setting PLLFRAC internal register. The PLL-FRAC value is updated, in steps of few ppms, by Update PLLFRAC signal.

Figure 6. PLL and Clocks Generation System

**ل ج ک** 

#### 2.4 PCM Output Interface

The decoded audio data are output in serial PCM format. The interface consists of the following signals:

SDO PCM Serial Data Output

SCKT PCM Serial Clock Output

LRCLK Left/Right Channel Selection Clock

The output samples precision is selectable from 16 to 24 bits/word, by setting the output precision (16, 18, 20 and 24 bits) with PCMCONF register.

Data can be output either with the most significant bit first (MS) or least significant bit first (LS), selected by writing into a flag of the PCMCONF register. Figure 8 gives a description of the STA003T PCM Output Formats. The sample rates set decoded by STA003T is described in Table 1.

#### Figure 8. PCM Output Formats

#### Table 1. MPEG Sampling Rates (KHz)

MPEG 1	MPEG 2	MPEG 2.5
48	24	12
32	16	8

#### 2.5 STA003T Decoding States

There are three different decoder states: **Idle**, **Init**, and **Decode**. Commands to change the decoding states are described in the STA003T I<sup>2</sup>C registers description.

#### Idle Mode

In this mode the decoder is waiting for the RUN command. This mode should be used to initialise the configuration register of the device. The DAC connected to STA003T can be initialised during this mode (set MUTE to 1).

PLAY	MUTE	Clock State	PCM Output
Х	0	Not Running	0
Х	1	Running	0

#### Init Mode

"PLAY" and "MUTE" changes are ignored in this mode. The internal state of the decoder will be updated only when the decoder changes from the state "init" to the state "decode". The "init" phase ends when the first decoded samples are at the output stage of the device.

#### Decode Mode

This mode is completely described by the following table:

PLAY	MUTE	Clock State	PCM Output	Decoding
0	0	Not Running	0	No
0	1	Running	0	No
1	0	Running	Decoded Samples	Yes
1	1	Running	0	Yes

#### **DEVICE OPERATION**

#### 3.0 I<sup>2</sup>C BUS SPECIFICATION

The STA003T supports the I<sup>2</sup>C protocol. This protocol defines any device that sends data on to the bus as a transmitter and any device that reads the data as a receiver. The device that controls the data transfer is known as the master and the others as the slave.

The master will always start the transfer and provides the serial clock for synchronisation. The STA003T is always a slave device in all its communications.

Q.

#### 3.1 COMMUNICATION PROTOCOL

#### 3.1.0 Data transition or change

Data changes on the SDA line must only occur when the SCL clock is low. SDA transitions while the clock is high are used to identify START or STOP condition.

#### 3.1.1 Start condition

START is identified by a high to low transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A START condition must precede any command for data transfer.

#### 3.1.2 Stop condition

STOP is identified by low to high transition of the data bus SDA signal while the clock signal SCL is stable in the high state. A STOP condition terminates communications between STA003T and the bus master.

#### 3.1.3 Acknowledge bit

An acknowledge bit is used to indicate a successful data transfer. The bus transmitter, either master or slave, will release the SDA bus after sending 8 bits of data. During the 9th clock pulse the receiver pulls the SDA bus low to acknowledge the receipt of 8 bits of data.

#### 3.1.4 Data input

During the data input the STA003T samples the SDA signal on the rising edge of the clock SCL. For correct device operation the SDA signal has to be stable during the rising edge of the clock and the data can change only when the SCL line is low.

#### 3.2 DEVICE ADDRESSING

To start communication between the master and the STA003T, the master must initiate with a start condition. Following this the master sends onto the SDA line 8 bits (MSB first) corresponding to the device

select address and read or write mode. The 7 most significant bits are the device address identifier, corresponding to the  $I^2C$  bus definition. For the STA003T these are fixed as 1000011.

The 8th bit (LSB) is the read or write operation bit (RW; set to 1 in read mode and to 0 in write mode). After a START condition the STA003T identifies on the bus the device address and if match is found, it acknowledges the identification on SDA bus during the 9th bit time. The following byte after the device identification byte are the internal space address.

#### 3.3 WRITE OPERATION (see fig. 9)

Following a START condition the master sends a device select code with the RW bit set to 0.

The STA003T acknowledges this and waits for the byte of internal address. After receiving the internal bytes address the STA003T again responds with an acknowledge.

#### 3.3.1 Byte write

In the byte write mode the master sends one data byte and this is acknowledged by STA003T. The master then terminates the transfer by generating a STOP condition.

#### 3.3.2 Multibyte write

The multibyte write mode can start from any internal address. The transfer is terminated by the master generating a STOP condition.

#### Figure 9. Write Mode Sequence

#### Figure 10. Read Mode Sequence

#### 3.4 READ OPERATION (see Fig. 10)

#### 3.4.1 Current byte address read

The STA003T has an internal byte address counter. Each time a byte is written or read, this counter, is incremented .

For the current byte address read mode, following a START condition the master sends the device address with the RW bit set to 1. The STA003T acknowledges this and outputs the byte addressed by the internal byte address counter.

47/

The master does not acknowledge the received byte, but terminates the transfer with a STOP condition.

#### 3.4.2 Sequential address read

This mode can be initiated with either a current address read or a random address read. However in this case the master does acknowledge the data byte output and the STA003T continues to output the next byte in sequence.

To terminate the stream of bytes the master does not acknowledge the last received byte, but terminates the transfer with a STOP condition.

The output data stream is from consecutive byte addresses, with the internal byte address counter automatically incremented after each byte output.

#### 4.0 I<sup>2</sup>C REGISTERS

The following table gives a description of the MPEG Source Decoder (STA003T) register list. The first column (HEX\_COD) is the hexadecimal code for the sub-address.

The second column (DEC\_COD) is the decimal code. The third column (DESCRIPTION) is the description of the information contained in the register.

The fourth column (RESET) inidicate the reset value if any. When no reset value is specifyed, the default is "undefined". The fifth column (R/W) is the flag to distinguish register "read only" and "read and write", and the useful size of the register itself.

Each register is 8 bit wide. The master shall operate reading or writing on 8 bits only.

#### 4.1 STA003T REGISTER DESCRIPTION

The STA003T device includes 128 I<sup>2</sup>C registers. In this document, only the user-oriented registers are described. The undocumented registers are reserved. These registers must never be accessed (in Read or in Write mode). The Read- Only registers must never be written. The following table describes the meaning of the abbreviations used in the I<sub>2</sub>C registers description:

Symbol	Comment
NA	Not Applicable
UND	Undefined
NC	No Charge
RO	Read Only
WO	Write Only
R/W	Read and Write
R/WS	Read, Write in specific mode

The HEAD registers can be viewed as logically concatenated to store the MPEG Layer III Header content. The set of three registers is updated every time the synchronisation to the new MPEG frame is achieved .

The meaning of the flags are shown in the following tables:

IDex	ID							
0	0	MPEG 2.5						
0	1	reserved						
1	0	MPEG 2						
1	1	MPEG 1						
Layer								
in Layer III these two flags must be	set always to "01".	)						

#### Layer

#### Protection bit

It equals "1" if no redundancy has been added and "0" if redundancy has been added.

#### Bitrate index

indicates the bitrate (Kbit/sec) depending on the MPEG ID.

bitrate index	ID = 1	ID = 0
,0000,	free	free
'0001'	32	8
'0010'	40	16
'0011'	48	24
'0100'	56	32
'0101'	64	40
'0110'	80	48
'0111'	96	56
'1000'	112	64
'1001'	128	80
'1010'	not supported	96
'1011'	not supported	112
'1100'	not supported	128
'1101'	not supported	not supported
'1110'	not supported	not supported
'1111'	forbidden	forbidden

#### **Sampling Frequency**

indicates the sampling frequency of the encoded audio signal (KHz) depending on the MPEG ID

Sampling Frequency	MPEG1	MPEG2	MPEG2.5
,00,	not supported	not supported	not supported
'01'	48	24	12
'10'	32	16	8
'11'	reserved	reserved	reserved

#### Padding bit

if this bit equals '1', the frame contains an additional slot to adjust the mean bitrate to the sampling frequency, otherwise this bit is set to '0'.

#### Private bit

Bit for private use. This bit will not be used in the future by ISO/IEC.Mode

Indicates the mode according to the following table. The joint stereo mode is intensity\_stereo and/or ms\_stereo.

mode	mode specified
'00'	stereo
'01'	joint stereo (intensity_stereo and/or ms_stereo)
'10'	dual_channel
'11'	single_channel (mono)

#### Mode extension

These bits are used in joint stereo mode. They indicates which type of joint stereo coding method is applied. The frequency ranges, over which the intensity\_stereo and ms\_stereo modes are applied, are implicit in the algorithm.

#### Copyright

If this bit is equal to '0', there is no copyright on the bitstream, '1' means copyright protected.

#### Original/Copy

This bit equals '0' if the bitstream is a copy, '1' if it is original.

#### Emphasis

Indicates the type of de-emphasis that shall be used.

emphasis	emphasis <b>specified</b>
,00,	none
'01'	50/15 microseconds
'10'	reserved
'11'	CCITT J,17

DRB register is used to re-direct the Right Channel on the Left, or to mix both the Channels. Default value is 0x00, corresponding at the maximum attenuation in the re-direction channel.

#### PCMDIVIDER

#### Address: 0x54

Type: RW

Software Reset: 0x01

Hardware Reset: 0x01

7	6	5	4	3	2	1	0
PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0

PCMDIVIDER is used to set the frequency ratio between the OCLK (Oversampling Clock for DACs), and the SCKT (Serial Audio Transmitter Clock).

The relation is the following:

$$SCKT_freq = \frac{OCLK_freq}{2(1 + PCMDIVIDER)}$$

The Oversampling Factor (O\_FAC) is related to OCLK and SCKT by the following expression:

1) OCLK\_freq = O\_FAC \* LRCKT\_ Freq (DAC relation)

2) OCLK\_ Freq = 2 \* (1+PCMDIVIDER) \* 32\* LRCKT\_Freq (when 16 bit PCM mode is used)

3) OCLK\_ Freq = 2 \* (1+PCMDIVIDER) \* 64\* LRCKT\_Freq (when 32 bit PCM mode is used)

4) PCMDIVIDER = (O\_FAC/64) - 1 in 16 bit mode

5) PCMDIVIDER = (O\_FAC/128) - 1 in 32 bit mode

Example for setting:

MSB							LSB		
b7	b6	b5	b4	b3	b2	b1	b0	Desc	cription
PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0		
0	0	0	0	0	1	1	1	16 bit mode	512 x Fs
0	0	0	0	0	1	0	1	16 bit mode	384 x Fs
0	0	0	0	0	0	1	1	16 bit mode	256 x Fs
0	0	0	0	0	0	1	1	32 bit mode	512 x Fs
0	0	0	0	0	0	1	0	32 bit mode	384 x Fs
0	0	0	0	0	0	0	1	32 bit mode	256 x Fs

for 16 bit PCM Mode

O\_FAC = 512 ; PCMDIVIDER = 7 O\_FAC = 256 ; PCMDIVIDER = 3 O\_FAC = 384 ; PCMDIVIDER = 5

for 32 bit PCM Mode

O\_FAC = 512 ; PCMDIVIDER = 3 O\_FAC = 256 ; PCMDIVIDER = 1 O\_FAC = 384 ; PCMDIVIDER = 2

MSB

Software Reset: 0x21 Hardware Reset: 0x21

LSB

		·	·		i			•
b7	b6	b5	b4	b3	b2	b1	b0	Description
Х	ORD	DIF	INV	FOR	SCL	PREC [1]	PREC ([0]	
Х	1							PCM order the LS bit is transmitted First
Х	0							PCM order the MS bit is transmitted First
Х		0						The word is right padded
Х		1						The word is left padded
Х			1					LRCKT Polarity compliant to I2S format
Х			0					LRCKT Polarity inverted
х				0				I <sup>2</sup> S format
Х				1				Different formats
Х					1			Data are sent on the rising edge of SCKT
Х					0			Data are sent on the falling edge of SCKT
Х						0	0	16 bit mode (32 slots transmitted per LRCKT period)
Х						0	1	18 bit mode (64 slots transmitted per LRCKT period)
Х						1	0	20 bit mode (64 slots transmitted per LRCKT period)
Х						1	1	24 bit mode (64 slots transmitted per LRCKT period)

PCMCONF is used to set the PCM Output Interface configuration:

ORD: PCM order. If this bit is set to'1', the LS Bit is transmitted first, otherwise MS Bit is transmitted first.

DIF: PCM DIFF. It is used to select the position of the valid data into the transmitted word. This setting is significant only in 18/20/24 bit/word ode. If it is set to '0' the word is right-padded, otherwise it is left-padded.

INV (fig.12): It is used to select the LRCKT clock polarity. If it is set to '1' the polarity is compliant to 2S format (low -> left, high -> right), otherwise the LRCKT is inverted. The default value is '0'. (if I<sup>2</sup>S have to be selected, must be set to '1' in the STA003T configuration phase).

#### Figure 12. LRCKT Polarity Selection

FOR: FORMAT is used to select the PCM Output Interface format.

After hw and sw reset the value is set to 0 corresponding to I<sup>2</sup>S format.

SCL (fig. 13); used to select the Transmitter Serial Clock polarity. If set to '1' the data are sent on the rising edge of SCKT and sampled on the falling. If set to '0', the data are sent on the falling edge and sampled on the rising. This last option is the most commonly used by the commercial DACs.

The default configuration for this flag is '0'.

#### Figure 13. SCKT Polarity Selection

#### PREC [1:0]: PCM PRECISION

It is used to select the PCM samples precision, as follows:

'00': 16 bit (16 slots transmitted per LCKT period)

'01': 18 bit (32 slots transmitted per LCKT period)

'10': 20 bit (32 slots transmitted per LCKT period)

'11': 24 bit (32 slots transmitted per LCKT period)

The PCM samples precision in STA003T can be 16 or 18-20-24 bits.

urai Proofe br When STA003T operates with a 16 (18-20-24) bits precision, the number of bits transmitted during a LRCKT period is 32 (64).

#### ANCILLARY DATA BUFFER

Address: 0x59 - 0x5D

Type: RO

Software Reset: 0x00

Hardware Reset: 0x00

STA003T can extract max 56 bytes/MPEG frame. To know the number of A.D. bits available every MPEG frame, the ANCCOUNT L and ANCCOUNT H registers (0x41 and 0x42) have to be read.

The buffer dimension is 5 bytes, written by STA003T core in sequential order. The timing information to read the buffer can be obtained by reading the FRAME\_CNT registers (0x67 - 0x69). To fill up the buffer with a new 5-bytes slot, the STA003T waits until a CMD\_INTERRUPT register is written by the master.

In the digital output audio, the full signal is achieved with 0 dB of attenuation. For this reason, before applying Bass & Treble Control, the user has to set the TONE\_ATTEN register to the maximum value of enhancement is going to perform. For example, in case of a 0 dB signal (max. level) only attenuation would be possible. If enhancement is desired, the signal has to be attenuated accordingly before in order to reserve a margin in dB.

An increment of a decimal unit corresponds to a Tone Attenuation step of 1.5dB.

#### 5.2 MPEG Ancillary Data Description:

As specifyed in the ISO standard, the MPEG Layer III frames have a variable bit lenght, and are constant in time depending on the audio sampling frequencies. The time duration of the Layer III frames is shown in Tab 2.

#### **MPEG Layer III Frames Time Duration**

Sampling Frequency (KHz)	48	32	24	16	12	8
MPEG Frame Lenght (ms)	24	36	24	36	48	72

The Ancillary Data extraction on STA003T can be described as follow:

STA003T has a specific 5 bytes Ancillary Data buffer, mapped into the I<sup>2</sup>C registers:

0x59	ANC_DATA_1
0x5A	ANC_DATA_2
0x5B	ANC_DATA_3
0x5C	ANC_DATA_4
0x5D	ANC_DATA_5

Since the content of Ancillary Data into an MPEG Frame is max. 56 bytes, a specific register, to require new 5 bytes, is needed.

This register is:

0x16	CMD_INTERRUPT

The interrupt register, is sensitive to any non-zero value written by the Microcontroller. When this register is updated the Ancillary Data buffer is filled up with new values and the registers

0x41	ACCOUNT_L
0x42	ACCOUNT_H

are updated (decremented) accordingly.

#### 5.3 I/O CELL DESCRIPTION

1) CMOS Tristate Output Pad Buffer, 4mA, with Slew Rate Control / Pins number 9, 10, 11, 20, 28,

#### 2) CMOS Bidir Pad Buffer, 4mA, with Slew Rate Control / Pins number 3, 12

#### 3) CMOS Input Pad Buffer / Pin number 4, 5, 6, 8, 21, 25

#### 4) CMOS Input Pad Buffer with Active Pull-Up / Pins number 7, 24, 26

INPUT PIN	CAPACITANCE
A	3.5pF

#### 5.4 TIMING DIAGRAMS

#### 5.4.1 Audio DAC Interface

a) OCLK in output. The audio PLL is used to clock the DAC

tsdo = 3.5 + pad\_timing (Cload\_SDO) - pad\_timing (Cload\_ OCLK) tsckt = 4 + pad\_timing (Cload\_SCKT) - pad\_timing (Cload\_ OCLK) tlrckt = 3.5 + pad\_timing (Cload\_LRCCKT) - pad\_timing (Cload\_OCLK)

#### Pad-timing versus load

$1300 = 3.5 + pad_timing (Cload_SDO) - pad_tim$	ling (Cload_ UCLK)
tsckt = 4 + pad_timing (Cload_SCKT) - pad_tim	ing (Cload_ OCLK)
tlrckt = 3.5 + pad_timing (Cload_LRCCKT) - pad	d_timing (Cload_OCLK)
Pad-timing versus load	00000
Load (pF)	Pad_timing
25	2.90ns
50	3.82ns
75	4.68ns
100	5.52ns

Cload\_XXX is the load in pF on the XXX output.

Pad\_timing (Cload\_XXX) is the propagation delay added to the XXX pad due to the load.

#### b) OCLK in input

Thi min = 3ns

Tlo min = 3ns

Toclk min = 25ns

tsdo = 5.5 + pad\_timing (Cload\_SDO) ns

tsckt = 6 + pad\_timing (Cload\_SCKT) ns

tlrckt = 5.5 + pad\_timing (Cload\_LRCKT) ns

**ά**τ/

#### 5.4.2 Bitstream input interface (SDI, SCKR, BIT\_EN)

t\_src\_low min duration is 50ns (1DSP clock period)

t\_src\_high min duration is 50ns (1DSP clock period)

### 5.4.4 XTI, XTO and CLK\_OUT timings

**لركم** 

txto = 1.40 + pad\_timing (Cload\_XTO) ns

#### 5.4.5 RESET

The Reset min duration (t\_reset\_low\_min) is 100ns

RESET

#### 5.5 DAC RELATED REGISTERS CONFIGURATION

The different DAC registers must be configured for 48kHz audio frequency: this is the reference frequency. The STA003T will use these parameters to derivate the register configurations for the other audio frequencies (32, 24, 16, 12, 8 KHz) according to the bistream informations. The STA003T DAC and PLL register must be configured according to the following steps:

1) OCLK\_Freq determination from the DAC oversampling factor O\_FAC.

- As all STA003T registers must be configured for 48KHz reference frequency, the OCLK frquency is: OCLK\_Freq = O\_FAC × 48KHz ex: O\_FAC = 384, OCLK\_Freq = 18.432MHz
- 2) PCMDIVIDER (0 x 54) register configuration. The PCMDIVIDER register is used to configure the frequency ratio between OCLK\_Freq and SCKT\_Freq:

$$SCKT_freq = \frac{OCLK_freq}{(2 \cdot (1 + PCMDIVIDER))}$$

The SCKT signal is the bit clock for the DAC serial output. The SCKT frequency depends on the number of bits to be transmitted to the DAC during one LRCKT (Left/Right clock) clock period.

These number of bit depends on the DAC precision (16, 18, 20 or 24bits) and on the mode that is used to transmit the data to the DAC (see figure 8).

Once the PCMCONF register is set according to the DAC requirements, the number of SCKT clock periods per LRCKT clock period is 16x2 or 32x2.

a) LRCKT\_period = 16x2 SCKT\_periods

SCKT\_freq = LRCKT\_freq 
$$\cdot$$
 32 =  $\frac{OCLK_freq}{(2 \cdot (1 + PCMDIVIDER)))}$ 

As the reference audio frequency is 48 KHz, the previous relation becomes:

 $48 \text{KHz} \cdot 32 = 48 \text{kHz} \cdot \text{O}_{\text{FAC}} (2 \cdot (1 + \text{PCMDIVIDER}))$ 

Consequently:

PCMDIVIDER = (O\_FAC/64)-1

ex: O\_FAC = 384, PCMCONF[1:0] = 00, PCMDIVIDER = 5

b) LRCKT\_period = 32x2 SCKT\_periods

SCKT\_freq = LRCKT\_freq 
$$\cdot$$
 64 =  $\frac{OCLK_freq}{(2 \cdot (1 + PCMDIVIDER))}$ 

Consequently:

PCMDIVIDER = (O\_FAC/128)-1

3) Configuration of the PLL registers to set OCLK\_FREQ to the desired value computed in step 1. The PLL configuration in direct relation with the XTI input clock frequency (14.72 MHz).

$$\mathsf{OCLK\_freq} \ = \ \frac{1}{1 + \mathsf{MFSDF}(X)} \cdot \left(\frac{14.72\,\mathsf{MHz}}{1 + \mathsf{PLLCT}\overline{\mathsf{L}\_N}}\right) \cdot \left(\mathsf{PLCT}\overline{\mathsf{L}\_M} + 1 + \frac{\mathsf{PLLFRAC}}{65536}\right)$$

- MFSDF(X) is the value of the MFSDF(X)(0x61) register.
- PLLCTL\_N is the value of the PLLCTL\_N (0x07) register.
- PLLCTL\_M is the value of the PLLCTL\_N (0x07) register.
- PLLFRAC (decimal) is the value of the PLLFRAC\_H and PLLFRAC\_L registers as PLLFRAC = 256
  × PLLFRAC\_H + PLLFRAC\_L.

The following table gives the possible values for these registers according to different OCLK\_Freq values. Other values can be supported on request to STMicroelectronics.

O_FAC	OCLK_Freq AT 48KHz	PLLCTL_N	PLLCTL_M	PLLFRAC	MFSDF
128	6.144MHz	0	12	23365	31
