

## SY54017R

Low Voltage 1.2V/1.8V CML 2:1 MUX  
with Fail Safe Inputs, 3.2Gbps, 2.5GHz

### General Description

The SY54017R is a fully differential, low voltage 1.2V/1.8V CML 2:1 MUX with Fail Safe Inputs. The SY54017R can process clock signals as fast as 2.5GHz or data patterns up to 3.2Gbps.

The differential input includes Micrel's unique, 3-pin input termination architecture that interfaces to LVPECL, LVDS or CML differential signals, (AC- or DC-coupled from a 2.5V driver) as small as 100mV (200mV<sub>PP</sub>) without any level-shifting or termination resistor networks in the signal path. For AC-coupled input interface applications, an internal voltage reference is provided to bias the V<sub>T</sub> pin. The outputs are CML, with extremely fast rise/fall times guaranteed to be less than 95ps.

The SY54017R operates from a 2.5V ±5% core supply and a 1.8V or 1.2V ±5% output supply and is guaranteed over the full industrial temperature range (−40°C to +85°C). The SY54017R is part of Micrel's high-speed, Precision Edge<sup>®</sup> product line.

Datasheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

### Features

- 1.2V/1.8V CML 2:1 MUX with Fail Safe Inputs
- Guaranteed AC performance over temperature and voltage:
  - DC-to- > 3.2Gbps throughput
  - <390ps propagation delay (IN-to-Q)
  - <20ps Input-to-Input skew
  - <95ps rise/fall times
- Ultra-low jitter design
  - <1ps<sub>RMS</sub> cycle-to-cycle jitter
  - <10ps<sub>PP</sub> total jitter
  - <1ps<sub>RMS</sub> random jitter
  - <10ps<sub>PP</sub> deterministic jitter
- High-speed CML outputs
- 2.5V ±5% , 1.8/1.2V ±5% power supply operation
- Industrial temperature range: −40°C to +85°C
- Available in 16-pin (3mm x 3mm) MLF<sup>®</sup> package

### Applications

- Data Distribution: OC-48, OC-48+FEC
- SONET clock and data distribution
- Fibre Channel clock and data distribution
- Gigabit Ethernet clock and data distribution

### Markets

- Storage
- ATE
- Test and measurement
- Enterprise networking equipment
- High-end servers
- Access
- Metro area network equipment

## Pin Configuration

**16-Pin MLF<sup>®</sup> (MLF-16)**

## Pin Description

Pin Number	Pin Name	Pin Function
16,1 4,5	IN0, /IN0 IN1, /IN1	Differential Inputs: These input pairs are the differential signal inputs to the device. They accept differential signals as small as 100mV (200mV <sub>PP</sub> ). Each input pin internally terminates with 50Ω to the VT pin. If the input swing falls below a certain threshold (typical 30mV), the Fail Safe Input (FSI) feature will guarantee a stable output by latching the output to its last valid state.
2 3	VT0 VT1	Input Termination Center-Tap: Each side of the differential input pair terminates to a VT pin. This pin provides a center-tap to a termination network for maximum interface flexibility. An internal high impedance resistor divider biases VT to allow input AC coupling. For AC-coupling, bypass VT with a 0.1μF low ESR capacitor to VCC. See "Interface Applications" subsection and Figure 2a.
15	SEL	This single-ended TTL/CMOS compatible input selects the inputs to the multiplexer. Note that this input is internally connected to a 25k ohm pull-up resistor and will default to a logic HIGH state if left open.
7	VCC	Positive Power Supply: Bypass with 0.1uF//0.01uF low ESR capacitors as close to the V <sub>CC</sub> pin as possible. Supplies input and core circuitry.
8,13	VCCO	Output Supply: Bypass with 0.1uF//0.01uF low ESR capacitors as close to the V <sub>CCO</sub> pins as possible. Supplies the output buffer.
14	GND, Exposed pad	Ground: Exposed pad must be connected to a ground plane that is the same potential as the ground pin.
11,10	Q, /Q	CML Differential Output Pair: Differential buffered copy of the input signal. The output swing is typically 390mV. See "Interface Applications" subsection for termination information.

**Notes:**

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum ratings conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Package thermal resistance assumes exposed pad is soldered (or equivalent) to the device's most negative potential on the PCB.  $\psi_{JB}$  and  $\theta_{JA}$  values are determined for a 4-layer board in still-air number, unless otherwise stated.
4. The circuit is designed to meet the DC specifications shown in the above table after thermal equilibrium has been established.

### Notes:

- Propagation delay is measured with input  $t_r/t_f \leq 300ps$  (20% to 80%).
- Input-to-Input skew is the difference in time between both inputs and the output for the same temperature, voltage and transition.
- Part-to-part skew is defined for two parts with identical power supply voltages at the same temperature and no skew at the edges at the respective inputs.  $V_{in} > 200mV$  with input  $t_r/t_f \leq 300ps$  (20% to 80%).
- Random jitter is measured with a K28.7 pattern, measured at  $\leq f_{MAX}$ .
- Deterministic jitter is measured at 2.5Gbps with both K28.5 and  $2^{23}-1$  PRBS pattern.
- Cycle-to-cycle jitter definition: the variation period between adjacent cycles over a random sample of adjacent cycle pairs.  $t_{JITTER\_CC} = T_n - T_{n+1}$ , where T is the time between rising edges of the output signal.
- Total jitter definition: with an ideal clock input frequency of  $\leq f_{MAX}$  (device), no more than one output edge in  $10^{12}$  output edges will deviate by more than the specified peak-to-peak jitter value.
- Crosstalk induced jitter is defined as the added jitter that results from signals applied to the adjacent channel. It is measured at the output while applying a similar, differential clock frequencies that are asynchronous with respect to each other at the adjacent input.

## Functional Description

### Fail-Safe Input (FSI)

The input includes a special failsafe circuit to sense the amplitude of the input signal and to latch the output when there is no input signal present, or when the amplitude of the input signal drops sufficiently below  $100\text{mV}_{\text{PK}}$  ( $200\text{mV}_{\text{PP}}$ ), typically  $30\text{mV}_{\text{PK}}$ . Maximum frequency of the SY54017R is limited by the FSI function.

### Input Clock Failure Case

If the input clock fails to a floating, static, or extremely low signal swing, the FSI function will eliminate a metastable condition and guarantee a stable output. No ringing and no undetermined state will occur at the output under these conditions.

Note that the FSI function will not prevent duty cycle distortion in case of a slowly deteriorating (but still toggling) input signal close to the FSI threshold. Due to the FSI function, the propagation delay will depend on rise and fall time of the input signal and on its amplitude. Refer to "Typical Characteristics" for detailed information

## Interface Applications

For Input Interface Applications, see Figures 4a-f and for CML Output Termination, see Figures 5a-d.

### CML Output Termination with VCCO 1.2V

For VCCO of 1.2V, Figure 5a, terminate the output with  $50\Omega$ -to-1.2V, DC-coupled, not  $100\Omega$  differentially across the outputs.

If AC-coupling is used, Figure 5d, terminate into  $50\Omega$  to 1.2V before the coupling capacitor and then connect to a high value resistor to a reference voltage.

Do not AC couple with internally terminated receiver. For example,  $50\Omega$  ANY-IN input. AC-coupling will offset the output voltage by 200mV and this offset voltage will be too low for proper driver operation.

### CML Output Termination with VCCO 1.8V

For VCCO of 1.8V, Figure 5a and Figure b, terminate with either  $50\Omega$ -to-1.8V or  $100\Omega$  differentially across the outputs. AC- or DC-coupling is fine.

### Input AC-Coupling

The SY54017R input can accept AC-coupling from any driver. Bypass VT with a  $0.1\mu\text{F}$  low ESR capacitor to VCC as shown in Figures 4c and 4d. VT has an internal high impedance resistor divider as shown in Figure 2a, to provide a bias voltage for AC-coupling.
