SHARC Processor

ADSP-21477/ADSP-21478/ADSP-21479

SUMMARY

High performance 32-bit/40-bit floating-point processor optimized for high performance audio processing

Single-instruction, multiple-data (SIMD) computational architecture

On-chip memory—up to 5M bits of on-chip RAM, 4M bits of on-chip ROM

Up to 300 MHz operating frequency

Qualified for automotive applications. See Automotive Products

Code compatible with all other members of the SHARC family

The ADSP-2147x processors are available with unique audio-centric peripherals, such as the digital applications interface, serial ports, precision clock generators, S/PDIF transceiver, asynchronous sample rate converters, input data port, and more.

Factory programmed ROM versions containing latest audio decoders from Dolby and DTS, available to IP licenses
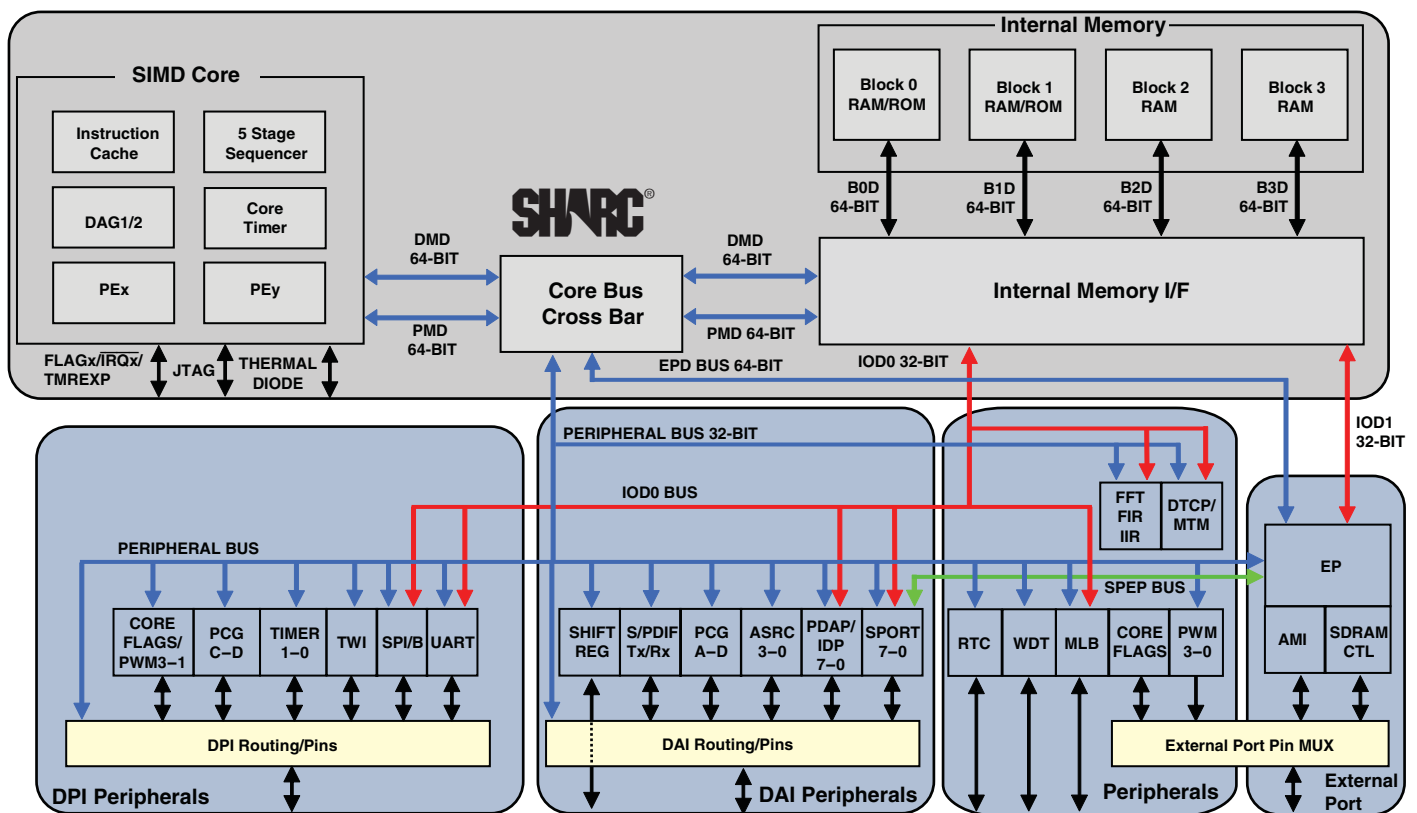

For complete ordering information, see Ordering Guide.

PRODUCT APPLICATION RESTRICTION

Not for use in in-vivo applications for body fluid constituent monitoring, including monitoring one or more of the components that form, or may be a part of, or contaminate human blood or other body fluids, such as, but not limited to, carboxyhemoglobin, methemoglobin total hemoglobin, oxygen saturation, oxygen content, fractional arterial oxygen saturation, bilirubin, glucose, drugs, lipids, water, protein, and pH.

GENERAL DESCRIPTION

The ADSP-2147x SHARC® processors are members of the SIMD SHARC family of DSPs that feature Analog Devices' Super Harvard Architecture. The processors are source code compatible with the ADSP-2126x, ADSP-2136x, ADSP-2137x, ADSP-2146x, and ADSP-2116x DSPs as well as with first generation ADSP-2106x SHARC processors in SISD (single-instruction, single-data) mode. These processors are 32-bit/40-bit floating-point processors optimized for high performance audio applications with a large on-chip SRAM, multiple internal buses to eliminate I/O bottlenecks, and an innovative digital applications interface (DAI).

Table 1 shows performance benchmarks for the ADSP-2147x processors. Table 2 shows the features of the individual product offerings.

Table 1. Processor Benchmarks

Benchmark Algorithm	Speed (at 300 MHz)	Speed (at 200 MHz)
1024 Point Complex FFT (Radix 4, with Reversal)	30.59 μs	45.885 μs
FIR Filter (per Tap)[1]	1.66 ns	2.49 ns
IIR Filter (per Biquad)[1]	6.65 ns	9.975 ns
Matrix Multiply (Pipelined) [3 × 3] × [3 × 1] [4 × 4] × [4 × 1]	14.99 ns 26.66 ns	22.485 ns 39.99 ns
Divide (y/x)	11.61 ns	17.41 ns
Inverse Square Root	18.08 ns	27.12 ns

[1] Assumes two files in multichannel SIMD mode.

Table 2. ADSP-2147x Family Features

Feature	ADSP-21477	ADSP-21478	ADSP-21479
Frequency	200 MHz	Up to 300 MHz	
RAM	2M bits	3M bits	5M bits
ROM	N/A	4M bits	
Pulse-Width Modulation	3	4 units (3 in 100-lead package)	
External Port Interface (SDRAM, AMI)[1]	No	Yes, 16-Bit	
Serial Ports	8		
Direct DMA from SPORTs to External Memory	No	Yes	
FIR, IIR, FFT Accelerator	Yes		
MediaLB Interface	No	Automotive models only	

Table 2. ADSP-2147x Family Features (Continued)

Feature	ADSP-21477	ADSP-21478	ADSP-21479
Watch Dog Timer[2]	No	Yes	
Real-Time Clock[2, 3]	No	Yes	
Shift Register[2]	No	Yes	
IDP/PDAP	Yes		
UART	1		
DAI (SRU)/DPI (SRU2)	20/14 Pins		
S/PDIF Transceiver	1		
SPI	2		
TWI	1		
SRC SNR Performance	−128 dB		
Thermal Diode[4]	Yes		
VISA Support	Yes		
Package[1]	100-Lead LQFP 88-Lead LFCSP_VQ	196-Ball CSP_BGA 100-Lead LQFP 88-lead LFCSP_VQ	

[1] The 100-lead and 88-lead packages of the processors do not contain an external port. The SDRAM controller pins must be disabled when using this package. For more information, see Pin Function Descriptions.

[2] Available on the 196-ball CSP_BGA package only.

[3] Real Time Clock (RTC) is supported only for products with a temperature range of 0°C to +70°C and not supported for all other temperature grades.

[4] Available on the 88-lead and 100-lead packages only.

The diagram on Page 1 shows the two clock domains (core and I/O processor) that make up the ADSP-2147x processors. The core clock domain contains the following features.

- Two processing elements (PEx, PEy), each of which comprises an ALU, multiplier, shifter, and data register file
- Two data address generators (DAG1, DAG2)
- A program sequencer with instruction cache
- PM and DM buses capable of supporting 2 × 64-bit data transfers between memory and the core at every core processor cycle
- One periodic interval timer with pinout
- On-chip SRAM (up to 5M bit)
- A JTAG test access port for emulation and boundary scan. The JTAG provides software debug through user breakpoints, which allows flexible exception handling.

ADSP-21477/ADSP-21478/ADSP-21479

The block diagram of the ADSP-2147x on Page 1 also shows the peripheral clock domain (also known as the I/O processor), which contains the following features:

- IOD0 (peripheral DMA) and IOD1 (external port DMA) buses for 32-bit data transfers

- Peripheral and external port buses for core connection

- External port with an asynchronous memory interface (AMI) and SDRAM controller

- 4 units for pulse width modulation (PWM) control

- 1 memory-to-memory (MTM) unit for internal-to-internal memory transfers

- Digital applications interface that includes four precision clock generators (PCG), an input data port (IDP/PDAP) for serial and parallel interconnect, an S/PDIF receiver/transmitter, four asynchronous sample rate converters, eight serial ports, a shift register, and a flexible signal routing unit (DAI SRU).

- Digital peripheral interface that includes two timers, a 2-wire interface, one UART, two serial peripheral interfaces (SPI), two precision clock generators (PCG), three pulse width modulation (PWM) units, and a flexible signal routing unit (DPI SRU).

As shown in the SHARC core block diagram on Page 5, the processors use two computational units to deliver a significant performance increase over the previous SHARC processors on a range of DSP algorithms. With its SIMD computational hardware, the processors can perform 1.8 GFLOPS running at 300 MHz.

FAMILY CORE ARCHITECTURE

The processors are code compatible at the assembly level with the ADSP-2146x, ADSP-2137x, ADSP-2136x, ADSP-2126x, ADSP-21160, and ADSP-21161, and with the first generation ADSP-2106x SHARC processors. The ADSP-2147x share architectural features with the ADSP-2126x, ADSP-2136x, ADSP-2137x, ADSP-2146x, and ADSP-2116x SIMD SHARC processors, as shown in Figure 2 and detailed in the following sections.

SIMD Computational Engine

The processors contain two computational processing elements that operate as a single-instruction, multiple-data (SIMD) engine. The processing elements are referred to as PEX and PEY and each contains an ALU, multiplier, shifter, and register file. PEX is always active, and PEY may be enabled by setting the PEYEN mode bit in the MODE1 register. SIMD mode allows the processor to execute the same instruction in both processing elements, but each processing element operates on different data. This architecture is efficient at executing math intensive DSP algorithms.

SIMD mode also affects the way data is transferred between memory and the processing elements because twice the data bandwidth is required to sustain computational operation in the processing elements. Therefore, entering SIMD mode also doubles the bandwidth between memory and the processing

elements. When using the DAGs to transfer data in SIMD mode, two data values are transferred with each memory or register file access.

SIMD mode is supported from external SDRAM but is not supported in the AMI.

Independent, Parallel Computation Units

Within each processing element is a set of computational units. The computational units consist of an arithmetic/logic unit (ALU), multiplier, and shifter. These units perform all operations in a single cycle. The three units within each processing element are arranged in parallel, maximizing computational throughput. Single multifunction instructions execute parallel ALU and multiplier operations. In SIMD mode, the parallel ALU and multiplier operations occur in both processing elements. These computation units support IEEE 32-bit single-precision floating-point, 40-bit extended precision floating-point, and 32-bit fixed-point data formats.

Timer

The processor contains a core timer that can generate periodic software interrupts. The core timer can be configured to use FLAG3 as a timer expired signal.

Data Register File

Each processing element contains a general-purpose data register file. The register files transfer data between the computation units and the data buses, and store intermediate results. These 10-port, 32-register (16 primary, 16 secondary) register files, combined with the processor's enhanced Harvard architecture, allow unconstrained data flow between computation units and internal memory. The registers in PEX are referred to as R0–R15 and in PEY as S0–S15.

Context Switch

Many of the processor's registers have secondary registers that can be activated during interrupt servicing for a fast context switch. The data registers in the register file, the DAG registers, and the multiplier result registers all have secondary registers. The primary registers are active at reset, while the secondary registers are activated by control bits in a mode control register.

Universal Registers

Universal registers can be used for general-purpose tasks. The USTAT (4) registers allow easy bit manipulations (Set, Clear, Toggle, Test, XOR) for all peripheral control and status registers.

The data bus exchange register (PX) permits data to be passed between the 64-bit PM data bus and the 64-bit DM data bus, or between the 40-bit register file and the PM/DM data bus. These registers contain hardware to handle the data width difference.

Single-Cycle Fetch of Instruction and Four Operands

The processors feature an enhanced Harvard architecture in which the data memory (DM) bus transfers data and the program memory (PM) bus transfers both instructions and data (see Figure 2). With its separate program and data memory

buses and on-chip instruction cache, the processor can simultaneously fetch four operands (two over each data bus) and one instruction (from the cache), all in a single cycle.

Figure 2. SHARC Core Block Diagram

Instruction Cache

The processor includes an on-chip instruction cache that enables three-bus operation for fetching an instruction and four data values. The cache is selective—only the instructions whose fetches conflict with PM bus data accesses are cached. This cache allows full speed execution of core looped operations such as digital filter multiply-accumulates, and FFT butterfly processing.

Data Address Generators with Zero-Overhead Hardware Circular Buffer Support

The processor's two data address generators (DAGs) are used for indirect addressing and implementing circular data buffers in hardware. Circular buffers allow efficient programming of delay lines and other data structures required in digital signal processing, and are commonly used in digital filters and Fourier transforms. The two DAGs of the processors contain sufficient registers to allow the creation of up to 32 circular buffers (16

primary register sets, 16 secondary). The DAGs automatically handle address pointer wraparound, reduce overhead, increase performance, and simplify implementation. Circular buffers can start and end at any memory location.

Flexible Instruction Set

The 48-bit instruction word accommodates a variety of parallel operations, for concise programming. For example, the processors can conditionally execute a multiply, an add, and a subtract in both processing elements while branching and fetching up to four 32-bit values from memory—all in a single instruction.

Variable Instruction Set Architecture (VISA)

In addition to supporting the standard 48-bit instructions from previous SHARC processors, the processors support new instructions of 16 and 32 bits. This feature, called Variable Instruction Set Architecture (VISA), drops redundant/unused

bits within the 48-bit instruction to create more efficient and compact code. The program sequencer supports fetching these 16-bit and 32-bit instructions from both internal and external SDRAM memory. This support is not extended to the asynchronous memory interface (AMI). Source modules need to be built using the VISA option, in order to allow code generation tools to create these more efficient opcodes.

On-Chip Memory

The processors contain varying amounts of internal RAM and internal ROM which is shown in Table 3 through Table 5. Each block can be configured for different combinations of code and data storage. Each memory block supports single-cycle, independent accesses by the core processor and I/O processor.

The processor's SRAM can be configured as a maximum of 160k words of 32-bit data, 320k words of 16-bit data, 106.7k words of 48-bit instructions (or 40-bit data), or combinations of different word sizes up to 5M bits. All of the memory can be accessed as 16-bit, 32-bit, 48-bit, or 64-bit words. A 16-bit

floating-point storage format is supported that effectively doubles the amount of data that may be stored on-chip. Conversion between the 32-bit floating-point and 16-bit floating-point formats is performed in a single instruction. While each memory block can store combinations of code and data, accesses are most efficient when one block stores data using the DM bus for transfers, and the other block stores instructions and data using the PM bus for transfers.

Using the DM bus and PM buses, with one bus dedicated to a memory block, assures single-cycle execution with two data transfers. In this case, the instruction must be available in the cache.

The memory maps in Table 3 through Table 5 display the internal memory address space of the processors. The 48-bit space section describes what this address range looks like to an instruction that retrieves 48-bit memory. The 32-bit section describes what this address range looks like to an instruction that retrieves 32-bit memory.

[1] Some processors include a customer-definable ROM block. ROM addresses on these models are not reserved as shown in this table. Please contact your Analog Devices sales representative for additional details.

On-Chip Memory Bandwidth

The internal memory architecture allows programs to have four accesses at the same time to any of the four blocks (assuming there are no block conflicts). The total bandwidth is realized using the DMD and PMD buses (2 × 64-bit at CCLK speed) and the IOD0/1 buses (2 × 32-bit at PCLK speed).

ROM Based Security

The processors have a ROM security feature that provides hardware support for securing user software code by preventing unauthorized reading from the internal code. When using this feature, the processors do not boot-load any external code, executing exclusively from internal ROM. Additionally, the processor is not freely accessible via the JTAG port. Instead, a unique 64-bit key, which must be scanned in through the JTAG or Test Access Port, is assigned to each customer. The device ignores an incorrect key. Emulation features are available after the correct key is scanned.

Digital Transmission Content Protection

The DTCP specification defines a cryptographic protocol for protecting audio entertainment content from illegal copying, intercepting, and tampering as it traverses high performance digital buses, such as the IEEE 1394 standard. Only legitimate entertainment content delivered to a source device via another approved copy protection system (such as the DVD content scrambling system) is protected by this copy protection system. For more information on this feature, contact your local ADI sales office.

FAMILY PERIPHERAL ARCHITECTURE

The ADSP-2147x family contains a rich set of peripherals that support a wide variety of applications including high quality audio, medical imaging, communications, military, test equipment, 3D graphics, speech recognition, motor control, imaging, and other applications.

External Memory

The external memory interface supports access to the external memory through core and DMA accesses. The external memory address space is divided into four banks. Any bank can be programmed as either asynchronous or synchronous memory. The external ports are comprised of the following modules.

- An AMI which communicates with SRAM, FLASH, and other devices that meet the standard asynchronous SRAM access protocol. The AMI supports 6M words of external memory in Bank 0 and 8M words of external memory in Bank 1, Bank 2, and Bank 3.

- An SDRAM controller that supports a glueless interface with any of the standard SDRAMs. The SDC supports 62M words of external memory in Bank 0, and 64M words of external memory in Bank 1, Bank 2, and Bank 3.

- Arbitration logic to coordinate core and DMA transfers between internal and external memory over the external port.

External Port

The external port provides a high performance, glueless interface to a wide variety of industry-standard memory devices. The external port, available on the 196-ball CSP_BGA, may be used to interface to synchronous and/or asynchronous memory devices through the use of its separate internal memory controllers. The first is an SDRAM controller for connection of industry-standard synchronous DRAM devices while the second is an asynchronous memory controller intended to interface to a variety of memory devices. Four memory select pins enable up to four separate devices to coexist, supporting any desired combination of synchronous and asynchronous device types. Non-SDRAM external memory address space is shown in Table 6.

Table 6. External Memory for Non-SDRAM Addresses

Bank	Size in Words	Address Range
Bank 0	6M	0x0020 0000–0x007F FFFF
Bank 1	8M	0x0400 0000–0x047F FFFF
Bank 2	8M	0x0800 0000–0x087F FFFF
Bank 3	8M	0x0C00 0000–0x0C7F FFFF

SIMD Access to External Memory

The SDRAM controller supports SIMD access on the 64-bit external port data bus (EPD) which allows access to the complementary registers on the PEy unit in the normal word space (NW). This improves performance since there is no need to explicitly load the complementary registers (as in SISD mode).

VISA and ISA Access to External Memory

The SDRAM controller supports VISA code operation which reduces the memory load since the VISA instructions are compressed. Moreover, bus fetching is reduced because, in the best case, one 48-bit fetch contains three valid instructions. Code execution from the traditional ISA operation is also supported.

Note that code execution is only supported from Bank 0 regardless of VISA/ISA. Table 7 shows the address ranges for instruction fetch in each mode.

Table 7. External Bank 0 Instruction Fetch

Access Type	Size in Words	Address Range
ISA (NW)	4M	0x0020 0000–0x005F FFFF
VISA (SW)	10M	0x0060 0000–0x00FF FFFF

SDRAM Controller

The SDRAM controller, available on the ADSP-2147x in the 196-ball CSP_BGA package, provides an interface of up to four separate banks of industry-standard SDRAM devices or DIMMs, at speeds up to f_{SDCLK}. Fully compliant with the SDRAM standard, each bank has its own memory select line ($\overline{MS0}$–$\overline{MS3}$), and can be configured to contain between 4 Mbytes and 256 Mbytes of memory. SDRAM external memory address space is shown in Table 8.

Table 8. External Memory for SDRAM Addresses

Bank	Size in Words	Address Range
Bank 0	62M	0x0020 0000–0x03FF FFFF
Bank 1	64M	0x0400 0000–0x07FF FFFF
Bank 2	64M	0x0800 0000–0x0BFF FFFF
Bank 3	64M	0x0C00 0000–0x0FFF FFFF

A set of programmable timing parameters is available to configure the SDRAM banks to support slower memory devices. The SDRAM and the AMI interface do not support 32-bit wide devices.

The SDRAM controller address, data, clock, and control pins can drive loads up to distributed 30 pF. For larger memory systems, the SDRAM controller external buffer timing should be selected and external buffering should be provided so that the load on the SDRAM controller pins does not exceed 30 pF.

Note that the external memory bank addresses shown are for normal-word (32-bit) accesses. If 48-bit instructions as well as 32-bit data are both placed in the same external memory bank, care must be taken while mapping them to avoid overlap.

Asynchronous Memory Controller

The asynchronous memory controller, available on the ADSP-2147x in the 196-ball CSP_BGA package, provides a configurable interface for up to four separate banks of memory or I/O devices. Each bank can be independently programmed with different timing parameters, enabling connection to a wide variety of memory devices including SRAM, flash, and EPROM, as well as I/O devices that interface with standard memory control lines. Bank 0 occupies a 6M word window and Banks 1, 2, and 3

occupy a 8M word window in the processor's address space but, if not fully populated, these windows are not made contiguous by the memory controller logic.

External Port Throughput

The throughput for the external port, based on 133 MHz clock and 16-bit data bus, is 88 Mbytes/sec for the AMI and 266 Mbytes/sec for SDRAM.

MediaLB

The automotive models of the processors have an MLB interface which allows the processor to function as a media local bus device. It includes support for both 3-pin and 5-pin MLB protocols. It supports speeds up to 1024 FS (49.25M bits/sec, FS = 48.1 kHz) and up to 31 logical channels, with up to 124 bytes of data per media local bus frame. For a list of automotive products, see Automotive Products.

Digital Applications Interface (DAI)

The digital applications interface (DAI) provides the ability to connect various peripherals to any of the DAI pins (DAI_P20–1).

Programs make these connections using the signal routing unit (SRU), shown in Figure 1.

The SRU is a matrix routing unit (or group of multiplexers) that enables the peripherals provided by the DAI to be interconnected under software control. This allows easy use of the DAI associated peripherals for a much wider variety of applications by using a larger set of algorithms than is possible with non configurable signal paths.

The associated peripherals include eight serial ports, four precision clock generators (PCG), a S/PDIF transceiver, four ASRCs, and an input data port (IDP). The IDP provides an additional input path to the SHARC core, configurable as either eight channels of serial data, or a single 20-bit wide synchronous parallel data acquisition port. Each data channel has its own DMA channel that is independent from the processor's serial ports.

Serial Ports (SPORTs)

The processors feature eight synchronous serial ports that provide an inexpensive interface to a wide variety of digital and mixed-signal peripheral devices such as Analog Devices' AD183x family of audio codecs, ADCs, and DACs. The serial ports are made up of two data lines, a clock, and frame sync. The data lines can be programmed to either transmit or receive and each data line has a dedicated DMA channel.

Serial ports can support up to 16 transmit or 16 receive DMA channels of audio data when all eight SPORTs are enabled, or four full duplex TDM streams of 128 channels per frame.

Serial port data can be automatically transferred to and from on-chip memory/external memory via dedicated DMA channels. Each of the serial ports can work in conjunction with another serial port to provide TDM support. One SPORT provides two transmit signals while the other SPORT provides the two receive signals. The frame sync and clock are shared.

Serial ports operate in five modes:

- Standard serial mode
- Multichannel (TDM) mode
- I^2S mode
- Packed I^2S mode
- Left-justified mode

S/PDIF-Compatible Digital Audio Receiver/Transmitter

The S/PDIF receiver/transmitter has no separate DMA channels. It receives audio data in serial format and converts it into a bi phase encoded signal. The serial data input to the receiver/transmitter can be formatted as left justified, I^2S or right-justified with word widths of 16, 18, 20, or 24 bits.

The serial data, clock, and frame sync inputs to the S/PDIF receiver/transmitter are routed through the signal routing unit (SRU). They can come from a variety of sources, such as the SPORTs, external pins, the precision clock generators (PCGs), and are controlled by the SRU control registers.

Asynchronous Sample Rate Converter (SRC)

The sample rate converter contains four blocks and is the same core as that used in the AD1896 192 kHz stereo asynchronous sample rate converter. The SRC block provides up to 128 dB SNR and is used to perform synchronous or asynchronous sample rate conversion across independent stereo channels, without using internal processor resources. The four SRC blocks can also be configured to operate together to convert multichannel audio data without phase mismatches. Finally, the SRC can be used to clean up audio data from jittery clock sources such as the S/PDIF receiver.

Input Data Port

The IDP provides up to eight serial input channels—each with its own clock, frame sync, and data inputs. The eight channels are automatically multiplexed into a single 32-bit by eight-deep FIFO. Data is always formatted as a 64-bit frame and divided into two 32-bit words. The serial protocol is designed to receive audio channels in I^2S, left-justified sample pair, or right-justified mode.

The IDP also provides a parallel data acquisition port (PDAP) which can be used for receiving parallel data. The PDAP port has a clock input and a hold input. The data for the PDAP can be received from DAI pins or from the external port pins. The PDAP supports a maximum of 20-bit data and four different packing modes to receive the incoming data.

Precision Clock Generators

The precision clock generators (PCG) consist of four units, each of which generates a pair of signals (clock and frame sync) derived from a clock input signal. The units, A B, C, and D are identical in functionality and operate independently of each other. The two signals generated by each unit are normally used as a serial bit clock/frame sync pair.

The outputs of PCG A and B can be routed through the DAI pins and the outputs of PCG C and D can be driven on to the DAI as well as the DPI pins.

Digital Peripheral Interface (DPI)

The digital peripheral interface provides connections to two serial peripheral interface ports (SPI), one universal asynchronous receiver-transmitter (UART), 12 flags, a 2-wire interface (TWI), three PWM modules (PWM3–1), and two general-purpose timers.

Serial Peripheral (Compatible) Interface (SPI)

The SPI is an industry-standard synchronous serial link, enabling the SPI-compatible port to communicate with other SPI compatible devices. The SPI consists of two data pins, one device select pin, and one clock pin. It is a full-duplex synchronous serial interface, supporting both master and slave modes. The SPI port can operate in a multi-master environment by interfacing with up to four other SPI-compatible devices, either acting as a master or slave device. The SPI-compatible peripheral implementation also features programmable baud rate and clock phase and polarities. The SPI-compatible port uses open drain drivers to support a multi-master configuration and to avoid data contention.

UART Port

The processors provide a full-duplex Universal Asynchronous Receiver/Transmitter (UART) port, which is fully compatible with PC-standard UARTs. The UART port provides a simplified UART interface to other peripherals or hosts, supporting full-duplex, DMA-supported, asynchronous transfers of serial data. The UART also has multiprocessor communication capability using 9-bit address detection. This allows it to be used in multidrop networks through the RS-485 data interface standard. The UART port also includes support for 5 to 8 data bits, 1 or 2 stop bits, and none, even, or odd parity. The UART port supports two modes of operation:

- PIO (programmed I/O) – The processor sends or receives data by writing or reading I/O-mapped UART registers. The data is double-buffered on both transmit and receive.

- DMA (direct memory access) – The DMA controller transfers both transmit and receive data. This reduces the number and frequency of interrupts required to transfer data to and from memory. The UART has two dedicated DMA channels, one for transmit and one for receive. These DMA channels have lower default priority than most DMA channels because of their relatively low service rates.

The UART port's baud rate, serial data format, error code generation and status, and interrupts are programmable:

- Support for bit rates ranging from (f_{PCLK}/1,048,576) to (f_{PCLK}/16) bits per second.

- Support for data formats from 7 to 12 bits per frame.

- Both transmit and receive operations can be configured to generate maskable interrupts to the processor.

In conjunction with the general-purpose timer functions, autobaud detection is supported.

Pulse-Width Modulation

The PWM module is a flexible, programmable, PWM waveform generator that can be programmed to generate the required switching patterns for various applications related to motor and engine control or audio power control. The PWM generator can generate either center-aligned or edge-aligned PWM waveforms. In addition, it can generate complementary signals on two outputs in paired mode or independent signals in non-paired mode (applicable to a single group of four PWM waveforms).

The entire PWM module has four groups of four PWM outputs generating 16 PWM outputs in total. Each PWM group produces two pairs of PWM signals on the four PWM outputs.

The PWM generator is capable of operating in two distinct modes while generating center-aligned PWM waveforms: single update mode or double update mode. In single update mode the duty cycle values are programmable only once per PWM period. This results in PWM patterns that are symmetrical about the midpoint of the PWM period. In double update mode, a second updating of the PWM registers is implemented at the midpoint of the PWM period. In this mode, it is possible to produce asymmetrical PWM patterns that produce lower harmonic distortion in three-phase PWM inverters.

PWM signals can be mapped to the external port address lines or to the DPI pins.

Timers

The processors have a total of three timers: a core timer that can generate periodic software interrupts and two general-purpose timers that can generate periodic interrupts and be independently set to operate in one of three modes:

- Pulse waveform generation mode
- Pulse width count/capture mode
- External event watch dog mode

The core timer can be configured to use FLAG3 as a timer expired signal, and the general-purpose timers have one bidirectional pin and four registers that implement its mode of operation: a 6-bit configuration register, a 32-bit count register, a 32-bit period register, and a 32-bit pulse width register. A single control and status register enables or disables the general-purpose timer.

2-Wire Interface Port (TWI)

The TWI is a bidirectional 2-wire serial bus used to move 8-bit data while maintaining compliance with the I^2C bus protocol. The TWI master incorporates the following features:

- 7-bit addressing
- Simultaneous master and slave operation on multiple device systems with support for multi-master data arbitration
- Digital filtering and timed event processing
- 100 kbps and 400 kbps data rates
- Low interrupt rate

Shift Register

The shift register can be used as a serial to parallel data converter. The shift register module consists of an 18-stage serial shift register, 18-bit latch, and three-state output buffers. The shift register and latch have separate clocks. Data is shifted into the serial shift register on the positive-going transitions of the shift register serial clock (SR_SCLK) input. The data in each flip-flop is transferred to the respective latch on a positive-going transition of the shift register latch clock (SR_LAT) input.

The shift register's signals can be configured as follows.

- The SR_SCLK can come from any of the SPORT0–7 SCLK outputs, PCGA/B clock, any of the DAI pins (1–8), and one dedicated pin (SR_SCLK).

- The SR_LAT can come from any of SPORT0–7 frame sync outputs, PCGA/B frame sync, any of the DAI pins (1–8), and one dedicated pin (SR_LAT).

- The SR_SDI input can from any of SPORT0–7 serial data outputs, any of the DAI pins (1–8), and one dedicated pin (SR_SDI).

Note that the SR_SCLK, SR_LAT, and SR_SDI inputs must come from same source except in the case of where SR_SCLK comes from PCGA/B or SR_SCLK and SR_LAT come from PCGA/B.

If SR_SCLK comes from PCGA/B, then SPORT0–7 generates the SR_LAT and SR_SDI signals. If SR_SCLK and SR_LAT come from PCGA/B, then SPORT0–7 generates the SR_SDI signal.

I/O PROCESSOR FEATURES

The I/O processor provides up to 65 channels of DMA as well as an extensive set of peripherals.

DMA Controller

The DMA controller operates independently and invisibly to the processor core, allowing DMA operations to occur while the core is simultaneously executing its program instructions. DMA transfers can occur between the processor's internal memory and its serial ports, the SPI-compatible (serial peripheral interface) ports, the IDP (input data port), the parallel data acquisition port (PDAP) or the UART.

Up to 65 channels of DMA are available on the processors as shown in Table 9.

Programs can be downloaded using DMA transfers. Other DMA features include interrupt generation upon completion of DMA transfers, and DMA chaining for automatic linked DMA transfers.

Table 9. DMA Channels

Peripheral	DMA Channels
SPORTs	16
PDAP	8
SPI	2
UART	2

Table 9. DMA Channels (Continued)

Peripheral	DMA Channels
External Port	2
Accelerators	2
Memory-to-Memory	2
MediaLB[1]	31

[1] Automotive models only.

Delay Line DMA

The processor provides delay line DMA functionality. This allows processor reads and writes to external delay line buffers (and therefore to external memory) with limited core interaction.

Scatter/Gather DMA

The processor provides scatter/gather DMA functionality. This allows processor DMA reads/writes to/from noncontiguous memory blocks.

FFT Accelerator

The FFT accelerator implements radix-2 complex/real input, complex output FFTs with no core intervention. The FFT accelerator runs at the peripheral clock frequency.

FIR Accelerator

The FIR (finite impulse response) accelerator consists of a 1024 word coefficient memory, a 1024 word deep delay line for the data, and four MAC units. A controller manages the accelerator. The FIR accelerator runs at the peripheral clock frequency.

IIR Accelerator

The IIR (infinite impulse response) accelerator consists of a 1440 word coefficient memory for storage of biquad coefficients, a data memory for storing the intermediate data and one MAC unit. A controller manages the accelerator. The IIR accelerator runs at the peripheral clock frequency.

Watchdog Timer (WDT)

The processors include a 32-bit watchdog timer that can be used to implement a software watchdog function. A software watchdog can improve system reliability by forcing the processor to a known state through generation of a system reset if the timer expires before being reloaded by software. Software initializes the count value of the timer, and then enables the timer.

The WDT is used to supervise the stability of the system software. When used in this way, software reloads the WDT in a regular manner so that the downward counting timer never expires. An expiring timer then indicates that system software might be out of control.

The WDT resets both the core and the internal peripherals. Software must be able to determine if the watch dog was the source of the hardware reset by interrogating a status bit in the watch dog timer control register.

The watch dog timer also has an internal RC oscillator that can be used as the clock source. The internal RC oscillator can be used as an optional alternative to using an external clock applied to the WDT_CLIN pin.

Real-Time Clock

The real-time clock (RTC) provides a robust set of digital watch features, including current time, stopwatch, and alarm. The RTC is clocked by a 32.768 kHz crystal external to the SHARC processor. Connect RTC pins RTXI and RTXO with external components as shown in Figure 3.

The RTC peripheral has dedicated power supply pins so that it can remain powered up and clocked even when the rest of the processor is in a low power state. The RTC provides several programmable interrupt options, including interrupt per second, minute, hour, or day clock ticks, interrupt on programmable stopwatch countdown, or interrupt at a programmed alarm time. An RTCLKOUT signal that operates at 1 Hz is also provided for calibration.
NOTE: C1 AND C2 ARE SPECIFIC TO CRYSTAL SPECIFIED FOR X1. CONTACT CRYSTAL MANUFACTURER FOR DETAILS. C1 AND C2 SPECIFICATIONS ASSUME BOARD TRACE CAPACITANCE OF 3 pF.

Figure 3. External Components for RTC

The 32.768 kHz input clock frequency is divided down to a 1 Hz signal by a prescaler. The counter function of the timer consists of four counters: a 60-second counter, a 60-minute counter, a 24-hour counter, and a 32,768-day counter. When the alarm interrupt is enabled, the alarm function generates an interrupt when the output of the timer matches the programmed value in the alarm control register. There are two alarms: The first alarm is for a time of day. The second alarm is for a day and time of that day.

The stopwatch function counts down from a programmed value, with one-second resolution. When the stopwatch interrupt is enabled and the counter underflows, an interrupt is generated.

SYSTEM DESIGN

The following sections provide an introduction to system design options and power supply issues.

Program Booting

The internal memory boots at system power-up from an 8-bit EPROM via the external port, an SPI master, or an SPI slave. Booting is determined by the boot configuration (BOOT_CFG2–0) pins in Table 10.

Table 10. Boot Mode Selection

BOOT_CFG2–0[1]	Booting Mode
000	SPI Slave Boot
001	SPI Master Boot (from Flash and Other Slaves)
010	AMI User Boot (for 8-bit Flash Boot)
011	No Boot (Processor Executes from Internal ROM After Reset)
100	Reserved
1xx	Reserved

[1] The BOOT_CFG2 pin is not available on the 100-lead or 88-lead packages.

A running reset feature is used to reset the processor core and peripherals without resetting the PLL and SDRAM controller, or performing a boot. The functionality of the $\overline{RESETOUT}$ /$\overline{RUNRSTIN}$ pin has now been extended to also act as the input for initiating a running reset. For more information, see the *ADSP-214xx SHARC Processor Hardware Reference*.

Power Supplies

The processors have separate power supply connections for the internal (V_{DD_INT}) and external (V_{DD_EXT}) power supplies. The internal and analog supplies must meet the V_{DD_INT} specifications. The external supply must meet the V_{DD_EXT} specification. All external supply pins must be connected to the same power supply.

To reduce noise coupling, the PCB should use a parallel pair of power and ground planes for V_{DD_INT} and GND.

Target Board JTAG Emulator Connector

Analog Devices DSP Tools product line of JTAG emulators uses the IEEE 1149.1 JTAG test access port of the processors to monitor and control the target board processor during emulation. Analog Devices DSP Tools product line of JTAG emulators provides emulation at full processor speed, allowing inspection and modification of memory, registers, and processor stacks. The processor's JTAG interface ensures that the emulator will not affect target system loading or timing.

For complete information on Analog Devices' SHARC DSP Tools product line of JTAG emulator operation, see the appropriate emulator hardware user's guide.

DEVELOPMENT TOOLS

Analog Devices supports its processors with a complete line of software and hardware development tools, including integrated development environments (which include CrossCore® Embedded Studio and/or VisualDSP++®), evaluation products, emulators, and a wide variety of software add-ins.

Integrated Development Environments (IDEs)

For C/C++ software writing and editing, code generation, and debug support, Analog Devices offers two IDEs.

The newest IDE, CrossCore Embedded Studio, is based on the Eclipse™ framework. Supporting most Analog Devices processor families, it is the IDE of choice for future processors, including multicore devices. CrossCore Embedded Studio

seamlessly integrates available software add-ins to support real time operating systems, file systems, TCP/IP stacks, USB stacks, algorithmic software modules, and evaluation hardware board support packages. For more information visit www.analog.com/cces.

The other Analog Devices IDE, VisualDSP++, supports processor families introduced prior to the release of CrossCore Embedded Studio. This IDE includes the Analog Devices VDK real time operating system and an open source TCP/IP stack. For more information visit www.analog.com/visualdsp. Note that VisualDSP++ will not support future Analog Devices processors.

EZ-KIT Lite Evaluation Board

For processor evaluation, Analog Devices provides wide range of EZ-KIT Lite® evaluation boards. Including the processor and key peripherals, the evaluation board also supports on-chip emulation capabilities and other evaluation and development features. Also available are various EZ-Extenders®, which are daughter cards delivering additional specialized functionality, including audio and video processing. For more information visit www.analog.com and search on "ezkit" or "ezextender".

EZ-KIT Lite Evaluation Kits

For a cost-effective way to learn more about developing with Analog Devices processors, Analog Devices offer a range of EZ-KIT Lite evaluation kits. Each evaluation kit includes an EZ-KIT Lite evaluation board, directions for downloading an evaluation version of the available IDE(s), a USB cable, and a power supply. The USB controller on the EZ-KIT Lite board connects to the USB port of the user's PC, enabling the chosen IDE evaluation suite to emulate the on-board processor in-circuit. This permits the customer to download, execute, and debug programs for the EZ-KIT Lite system. It also supports in-circuit programming of the on-board Flash device to store user-specific boot code, enabling standalone operation. With the full version of Cross-Core Embedded Studio or VisualDSP++ installed (sold separately), engineers can develop software for supported EZ-KITs or any custom system utilizing supported Analog Devices processors.

Software Add-Ins for CrossCore Embedded Studio

Analog Devices offers software add-ins which seamlessly integrate with CrossCore Embedded Studio to extend its capabilities and reduce development time. Add-ins include board support packages for evaluation hardware, various middleware packages, and algorithmic modules. Documentation, help, configuration dialogs, and coding examples present in these add-ins are viewable through the CrossCore Embedded Studio IDE once the add-in is installed.

Board Support Packages for Evaluation Hardware

Software support for the EZ-KIT Lite evaluation boards and EZ-Extender daughter cards is provided by software add-ins called Board Support Packages (BSPs). The BSPs contain the required drivers, pertinent release notes, and select example code for the given evaluation hardware. A download link for a specific BSP is located on the web page for the associated EZ-KIT or EZ-Extender product. The link is found in the *Product Download* area of the product web page.

Middleware Packages

Analog Devices separately offers middleware add-ins such as real time operating systems, file systems, USB stacks, and TCP/IP stacks. For more information see the following web pages:

- www.analog.com/ucos3
- www.analog.com/ucfs
- www.analog.com/ucusbd
- www.analog.com/lwip

Algorithmic Modules

To speed development, Analog Devices offers add-ins that perform popular audio and video processing algorithms. These are available for use with both CrossCore Embedded Studio and VisualDSP++. For more information visit www.analog.com and search on "Blackfin software modules" or "SHARC software modules".

Designing an Emulator-Compatible DSP Board (Target)

For embedded system test and debug, Analog Devices provides a family of emulators. On each JTAG DSP, Analog Devices supplies an IEEE 1149.1 JTAG Test Access Port (TAP). In-circuit emulation is facilitated by use of this JTAG interface. The emulator accesses the processor's internal features via the processor's TAP, allowing the developer to load code, set breakpoints, and view variables, memory, and registers. The processor must be halted to send data and commands, but once an operation is completed by the emulator, the DSP system is set to run at full speed with no impact on system timing. The emulators require the target board to include a header that supports connection of the DSP's JTAG port to the emulator.

For details on target board design issues including mechanical layout, single processor connections, signal buffering, signal termination, and emulator pod logic, see the *EE-68: Analog Devices JTAG Emulation Technical Reference* on the Analog Devices website (www.analog.com)—use site search on "EE-68." This document is updated regularly to keep pace with improvements to emulator support.

ADDITIONAL INFORMATION

This data sheet provides a general overview of the ADSP-2147x architecture and functionality. For detailed information on the family core architecture and instruction set, refer to the *SHARC Processor Programming Reference.*

RELATED SIGNAL CHAINS

A *signal chain* is a series of signal conditioning electronic components that receive input (data acquired from sampling either real-time phenomena or from stored data) in tandem, with the output of one portion of the chain supplying input to the next. Signal chains are often used in signal processing applications to gather and process data or to apply system controls based on analysis of real-time phenomena.

Analog Devices eases signal processing system development by providing signal processing components that are designed to work together well. A tool for viewing relationships between specific applications and related components is available on the www.analog.com website.

The Reference Designs page provides a link to Circuits from the Lab™ (www.analog.com/signal chains) which contains:

- Graphical circuit block diagram presentation of signal chains for a variety of circuit types and applications

- Drill down links for components in each chain to selection guides and application information

- Reference designs applying best practice design techniques

PIN FUNCTION DESCRIPTIONS

Table 11. Pin Descriptions

Name	Type	State During/ After Reset	Description
ADDR$_{23-0}$	I/O/T (ipu)	High-Z/driven low (boot)	**External Address.** The processor outputs addresses for external memory and peripherals on these pins. The ADDR pins can be multiplexed to support the external memory interface address, FLAGS15–8 (I/O) and PWM (O). After reset, all ADDR pins are in EMIF mode, and FLAG(0–3) pins are in FLAGS mode (default). When configured in the IDP_PDAP_CTL register, IDP channel 0 scans the ADDR$_{23-4}$ pins for parallel input data.
DATA$_{15-0}$	I/O/T (ipu)	High-Z	**External Data.** The data pins can be multiplexed to support the external memory interface data (I/O) and FLAGS$_{7-0}$ (I/O).
AMI_ACK	I (ipu)		**Memory Acknowledge.** External devices can deassert AMI_ACK (low) to add wait states to an external memory access. AMI_ACK is used by I/O devices, memory controllers, or other peripherals to hold off completion of an external memory access.
$\overline{MS}_{0-1}$	O/T (ipu)	High-Z	**Memory Select Lines 0–1.** These lines are asserted (low) as chip selects for the corresponding banks of external memory. The $\overline{MS}_{1-0}$ lines are decoded memory address lines that change at the same time as the other address lines. When no external memory access is occurring the $\overline{MS}_{1-0}$ lines are inactive; they are active however when a conditional memory access instruction is executed, when the condition evaluates as true. The $\overline{MS1}$ pin can be used in EPORT/FLASH boot mode. For more information on processor booting, see the *ADSP-214xx SHARC Processor Hardware Reference*.
$\overline{AMI\_RD}$	O/T (ipu)	High-Z	**AMI Port Read Enable.** $\overline{AMI\_RD}$ is asserted whenever the processor reads a word from external memory.
$\overline{AMI\_WR}$	O/T (ipu)	High-Z	**AMI Port Write Enable.** $\overline{AMI\_WR}$ is asserted when the processor writes a word to external memory.
FLAG0/$\overline{IRQ0}$	I/O (ipu)	FLAG[0] INPUT	**FLAG0/Interrupt Request0.**
FLAG1/$\overline{IRQ1}$	I/O (ipu)	FLAG[1] INPUT	**FLAG1/Interrupt Request1.**
FLAG2/$\overline{IRQ2}$/$\overline{MS2}$	I/O (ipu)	FLAG[2] INPUT	**FLAG2/Interrupt Request2/Memory Select2.** This pin is multiplexed with $\overline{MS2}$ in the 196-ball BGA package only.
FLAG3/TMREXP/$\overline{MS3}$	I/O (ipu)	FLAG[3] INPUT	**FLAG3/Timer Expired/Memory Select3.** This pin is multiplexed with $\overline{MS3}$ in the 196-ball BGA package only.

The following symbols appear in the Type column of Table 11: **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be 26 kΩ to 63 kΩ. The range of an ipd resistor can be 31 kΩ to 85 kΩ. The three-state voltage of ipu pads will not reach to full the V$_{DD\_EXT}$ level; at typical conditions the voltage is in the range of 2.3 V to 2.7 V.

In this table, all pins are LVTTL compliant with the exception of the thermal diode, shift register, and real-time clock (RTC) pins.

Not all pins are available in the 88-lead LFCSP_VQ and 100-lead LQFP package. For more information, see Table 2 on Page 3 and Table 62 on Page 70.

Table 11. Pin Descriptions (Continued)

Name	Type	State During/After Reset	Description
$\overline{SDRAS}$	O/T (ipu)	High-Z/driven high	**SDRAM Row Address Strobe.** Connect to SDRAM's RAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform.
$\overline{SDCAS}$	O/T (ipu)	High-Z/driven high	**SDRAM Column Address Select.** Connect to SDRAM's CAS pin. In conjunction with other SDRAM command pins, defines the operation for the SDRAM to perform.
$\overline{SDWE}$	O/T (ipu)	High-Z/driven high	**SDRAM Write Enable.** Connect to SDRAM's WE or W buffer pin.
SDCKE	O/T (ipu)	High-Z/driven high	**SDRAM Clock Enable.** Connect to SDRAM's CKE pin. Enables and disables the CLK signal. For details, see the data sheet supplied with the SDRAM device.
SDA10	O/T (ipu)	High-Z/driven high	**SDRAM A10 Pin.** Enables applications to refresh an SDRAM in parallel with non-SDRAM accesses. This pin replaces the DSP's ADDR10 pin only during SDRAM accesses.
SDDQM	O/T (ipu)	High-Z/driven high	**DQM Data Mask.** SDRAM input mask signal for write accesses and output enable signal for read accesses. Input data is masked when DQM is sampled high during a write cycle. The SDRAM output buffers are placed in a High-Z state when DQM is sampled high during a read cycle. SDDQM is driven high from reset de-assertion until SDRAM initialization completes. Afterwards, it is driven low irrespective of whether any SDRAM accesses occur or not.
SDCLK	O/T (ipd)	High-Z/driving	**SDRAM Clock Output.** Clock driver for this pin differs from all other clock drivers. See Figure 47. For models in the 100-lead package, the SDRAM interface should be disabled to avoid unnecessary power switching by setting the DSDCTL bit in SDCTL register. For more information, see the *ADSP-214xx SHARC Processor Hardware Reference*.
DAI _P$_{20-1}$	I/O/T (ipu)	High-Z	**Digital Applications Interface**. These pins provide the physical interface to the DAI SRU. The DAI SRU configuration registers define the combination of on-chip audio-centric peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determines the exact behavior of the pin. Any input or output signal present in the DAI SRU may be routed to any of these pins.
DPI _P$_{14-1}$	I/O/T (ipu)	High-Z	**Digital Peripheral Interface.** These pins provide the physical interface to the DPI SRU. The DPI SRU configuration registers define the combination of on-chip peripheral inputs or outputs connected to the pin and to the pin's output enable. The configuration registers of these peripherals then determine the exact behavior of the pin. Any input or output signal present in the DPI SRU may be routed to any of these pins.
WDT_CLKIN	I		**Watch Dog Timer Clock Input.** This pin should be pulled low when not used.
WDT_CLKO	O		**Watch Dog Resonator Pad Output.**
$\overline{WDTRSTO}$	O (ipu)		**Watch Dog Timer Reset Out.**

The following symbols appear in the Type column of Table 11: **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be 26 kΩ to 63 kΩ. The range of an ipd resistor can be 31 kΩ to 85 kΩ. The three-state voltage of ipu pads will not reach to full the V_{DD_EXT} level; at typical conditions the voltage is in the range of 2.3 V to 2.7 V.

In this table, all pins are LVTTL compliant with the exception of the thermal diode, shift register, and real-time clock (RTC) pins.

Not all pins are available in the 88-lead LFCSP_VQ and 100-lead LQFP package. For more information, see Table 2 on Page 3 and Table 62 on Page 70.

Table 11. Pin Descriptions (Continued)

Name	Type	State During/ After Reset	Description
THD_P	I		**Thermal Diode Anode.** When not used, this pin can be left floating.
THD_M	O		**Thermal Diode Cathode.** When not used, this pin can be left floating.
MLBCLK	I		**Media Local Bus Clock.** This clock is generated by the MLB controller that is synchronized to the MOST network and provides the timing for the entire MLB interface at 49.152 MHz at FS = 48 kHz. When the MLB controller is not used, this pin should be grounded.
MLBDAT	I/O/T in 3 pin mode. I in 5 pin mode.	High-Z	**Media Local Bus Data.** The MLBDAT line is driven by the transmitting MLB device and is received by all other MLB devices including the MLB controller. The MLBDAT line carries the actual data. In 5-pin MLB mode, this pin is an input only. When the MLB controller is not used, this pin should be grounded.
MLBSIG	I/O/T in 3 pin mode. I in 5 pin mode	High-Z	**Media Local Bus Signal.** This is a multiplexed signal which carries the Channel/Address generated by the MLB Controller, as well as the Command and RxStatus bytes from MLB devices. In 5-pin mode, this pin is input only. When the MLB controller is not used, this pin should be grounded.
MLBDO	O/T	High-Z	**Media Local Bus Data Output (in 5 Pin Mode).** This pin is used only in 5-pin MLB mode and serves as the output data pin. When the MLB controller is not used, this pin should be grounded.
MLBSO	O/T	High-Z	**Media Local Bus Signal Output (in 5 Pin Mode).** This pin is used only in 5-pin MLB mode and serves as the output signal pin. When the MLB controller is not used, this pin should be grounded.
SR_SCLK	I (ipu)		**Shift Register Serial Clock.** (Active high, rising edge sensitive)
$\overline{SR\_CLR}$	I (ipu)		**Shift Register Reset.** (Active low)
SR_SDI	I (ipu)		**Shift Register Serial Data Input.**
SR_SDO	O (ipu)	Driven Low	**Shift Register Serial Data Output.**
SR_LAT	I (ipu)		**Shift Register Latch Clock Input.** (Active high, rising edge sensitive)
SR_LDO_{17-0}	O/T (ipu)	High-Z	**Shift Register Parallel Data Output.**
RTXI	I		**RTC Crystal Input.** If RTC is not used, then this pin can be NC (no connect) or grounded and the RTC_PDN and RTC_BUSDIS bits of the RTC_INIT register must be set to 1.
RTXO	O		**RTC Crystal Output.** If RTC is not used, then this pin needs to be NC (No Connect).
RTCLKOUT	O (ipd)		**RTC Clock Output.** For calibration purposes. The clock runs at 1 Hz. If RTC is not used, then this pin needs to be NC (No Connect).

The following symbols appear in the Type column of Table 11: **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be 26 kΩ to 63 kΩ. The range of an ipd resistor can be 31 kΩ to 85 kΩ. The three-state voltage of ipu pads will not reach to full the V_{DD_EXT} level; at typical conditions the voltage is in the range of 2.3 V to 2.7 V.

In this table, all pins are LVTTL compliant with the exception of the thermal diode, shift register, and real-time clock (RTC) pins.

Not all pins are available in the 88-lead LFCSP_VQ and 100-lead LQFP package. For more information, see Table 2 on Page 3 and Table 62 on Page 70.

Table 11. Pin Descriptions (Continued)

Name	Type	State During/After Reset	Description
TDI	I (ipu)		**Test Data Input (JTAG).** Provides serial data for the boundary scan logic.
TDO	O/T	High-Z	**Test Data Output (JTAG).** Serial scan output of the boundary scan path.
TMS	I (ipu)		**Test Mode Select (JTAG).** Used to control the test state machine.
TCK	I		**Test Clock (JTAG).** Provides a clock for JTAG boundary scan. TCK must be asserted (pulsed low) after power-up or held low for proper operation of the device.
$\overline{TRST}$	I (ipu)		**Test Reset (JTAG).** Resets the test state machine. $\overline{TRST}$ must be asserted (pulsed low) after power-up or held low for proper operation of the processor.
$\overline{EMU}$	O (O/D, ipu)	High-Z	**Emulation Status.** Must be connected to the Analog Devices DSP Tools product line of JTAG emulators target board connector only.
CLK_CFG$_{1-0}$	I		**Core to CLKIN Ratio Control.** These pins set the startup clock frequency. Note that the operating frequency can be changed by programming the PLL multiplier and divider in the PMCTL register at any time after the core comes out of reset. The allowed values are: 00 = 8:1 01 = 32:1 10 = 16:1 11 = reserved
CLKIN	I		**Local Clock In.** Used in conjunction with XTAL. CLKIN is the clock input. It configures the processors to use either its internal clock generator or an external clock source. Connecting the necessary components to CLKIN and XTAL enables the internal clock generator. Connecting the external clock to CLKIN while leaving XTAL unconnected configures the processors to use the external clock source such as an external clock oscillator. CLKIN may not be halted, changed, or operated below the specified frequency.
XTAL	O		**Crystal Oscillator Terminal.** Used in conjunction with CLKIN to drive an external crystal.
$\overline{RESET}$	I		**Processor Reset.** Resets the processor to a known state. Upon deassertion, there is a 4096 CLKIN cycle latency for the PLL to lock. After this time, the core begins program execution from the hardware reset vector address. The $\overline{RESET}$ input must be asserted (low) at power-up.
$\overline{RESETOUT}$/$\overline{RUNRSTIN}$	I/O (ipu)		**Reset Out/Running Reset In.** The default setting on this pin is reset out. This pin also has a second function as RUNRSTIN which is enabled by setting bit 0 of the RUNRSTCTL register. For more information, see the *ADSP-214xx SHARC Processor Hardware Reference*.
BOOT_CFG$_{2-0}$	I		**Boot Configuration Select.** These pins select the boot mode for the processor. The BOOT_CFG pins must be valid before $\overline{RESET}$ (hardware and software) is de-asserted. The BOOT_CFG2 pin is only available on the 196-lead package.

The following symbols appear in the Type column of Table 11: **A** = asynchronous, **I** = input, **O** = output, **S** = synchronous, **A/D** = active drive, **O/D** = open drain, and **T** = three-state, **ipd** = internal pull-down resistor, **ipu** = internal pull-up resistor.

The internal pull-up (ipu) and internal pull-down (ipd) resistors are designed to hold the internal path from the pins at the expected logic levels. To pull-up or pull-down the external pads to the expected logic levels, use external resistors. Internal pull-up/pull-down resistors cannot be enabled/disabled and the value of these resistors cannot be programmed. The range of an ipu resistor can be 26 kΩ to 63 kΩ. The range of an ipd resistor can be 31 kΩ to 85 kΩ. The three-state voltage of ipu pads will not reach to full the V_{DD_EXT} level; at typical conditions the voltage is in the range of 2.3 V to 2.7 V.

In this table, all pins are LVTTL compliant with the exception of the thermal diode, shift register, and real-time clock (RTC) pins.

Not all pins are available in the 88-lead LFCSP_VQ and 100-lead LQFP package. For more information, see Table 2 on Page 3 and Table 62 on Page 70.

ADSP-21477/ADSP-21478/ADSP-21479

Table 12. Pin List, Power and Ground

Name	Type	Description
V_{DD_INT}	P	**Internal Power Supply.**
V_{DD_EXT}	P	**I/O Power Supply.**
V_{DD_RTC}	P	**Real-Time Clock Power Supply.** When RTC is not used, this pin should be connected to V_{DD_EXT}.
GND[1]	G	**Ground.**
V_{DD_THD}	P	**Thermal Diode Power Supply**. When not used, this pin can be left floating.

[1] The exposed pad is required to be electrically and thermally connected to GND. Implement this by soldering the exposed pad to a GND PCB land that is the same size as the exposed pad. The GND PCB land should be *robustly* connected to the GND plane in the PCB for best electrical and thermal performance. See also 88-LFCSP_VQ Lead Assignment and 100-LQFP_EP Lead Assignment.

SPECIFICATIONS

[1] Specifications subject to change without notice.
[2] Applies to input and bidirectional pins: ADDR23–0, DATA15–0, FLAG3–0, DAI_Px, DPI_Px, BOOT_CFGx, CLK_CFGx, RUNRSTIN, RESET, TCK, TMS, TDI, TRST, SDA10, AMI_ACK, MLBCLK, MLBDAT, MLBSIG.
[3] Applies to input pin CLKIN, WDT_CLKIN.
[4] Real Time Clock (RTC) is supported only for products in the BGA package with a temperature range of 0°C to +70°C. For the status of unused RTC pins please see Table 11.
[5] Automotive application use profile only. Not supported for nonautomotive use. Contact Analog Devices for more information.

ELECTRICAL CHARACTERISTICS

Parameter[1]	Description	Test Conditions	200 MHz Min	200 MHz Max	266 MHz Min	266 MHz Max	300 MHz Min	300 MHz Max	Unit

[1] Specifications subject to change without notice.
[2] Applies to output and bidirectional pins: ADDR23-0, DATA15-0, $\overline{AMI\_RD}$, $\overline{AMI\_WR}$, FLAG3–0, DAI_Px, DPI_Px, $\overline{EMU}$, TDO, $\overline{RESETOUT}$, MLBSIG, MLBDAT, MLBDO, MLBSO, $\overline{SDRAS}$, $\overline{SDCAS}$, $\overline{SDWE}$, SDCKE, SDA10, SDDQM, MS0-1.
[3] See Output Drive Currents for typical drive current capabilities.
[4] Applies to input pins: BOOT_CFGx, CLK_CFGx, TCK, $\overline{RESET}$, CLKIN.
[5] Applies to input pins with internal pull-ups: $\overline{TRST}$, TMS, TDI.
[6] Applies to three-statable pins: TDO, MLBDAT, MLBSIG, MLBDO, and MLBSO.
[7] Applies to three-statable pins with pull-ups: DAI_Px, DPI_Px, $\overline{EMU}$.
[8] Applies to three-statable pin with pull-down: SDCLK.
[9] See Engineer-to-Engineer Note "Estimating Power Dissipation for ADSP-214xx SHARC Processors" for further information.
[10] Applies to all signal pins.
[11] Guaranteed, but not tested.

Total Power Dissipation

The information in this section should be augmented with *Estimating Power for ADSP-214xx SHARC Processors (EE-348)*. Total power dissipation has two components:

1. Internal power consumption is additionally comprised of two components:

   - Static current due to leakage. Table 14 shows the static current consumption ($I_{DD\_INT\_STATIC}$) as a function of junction temperature (T_J) and core voltage (V_{DD_INT}).

   - Dynamic current ($I_{DD\_INT\_DYNAMIC}$), due to transistor switching characteristics and activity level of the processor. The activity level is reflected by the Activity Scaling Factor (ASF), which represents the activity level of the application code running on the processor core and having various levels of peripheral and external port activity (Table 13). Dynamic current consumption is calculated by selecting the ASF that corresponds most closely with the user application and then multiplying that with the dynamic current consumption (Table 15).

2. External power consumption is due to the switching activity of the external pins.

Table 13. Activity Scaling Factors (ASF)[1]

Activity	Scaling Factor (ASF)
Idle	0.31
Low	0.53
Medium Low	0.62
Medium High	0.78
Peak-Typical (50:50)[2]	0.85
Peak-Typical (60:40)[2]	0.93
Peak-Typical (70:30)[2]	1.00
High Typical	1.18
High	1.28
Peak	1.34

[1] See *Estimating Power for ADSP-214xx SHARC Processors (EE-348)* for more information on the explanation of the power vectors specific to the ASF table.
[2] Ratio of continuous instruction loop (core) to SDRAM control code reads and writes.

Table 14. Static Current—$I_{DD\_INT\_STATIC}$ (mA)[1]

| T_J (°C) | Voltage (V_{DD_INT}) | | | | | | |
	1.05 V	1.10 V	1.15 V	1.20 V	1.25 V	1.30 V	1.35 V
−45	< 0.1	< 0.1	0.4	0.8	1.3	2.1	3.3
−35	< 0.1	< 0.1	0.4	0.7	1.1	1.7	2.9
−25	< 0.1	0.2	0.4	0.8	1.2	1.7	2.9
−15	< 0.1	0.4	0.6	1.0	1.4	1.9	3.2
−5	0.2	0.6	0.9	1.3	1.8	2.3	3.7
+5	0.5	0.9	1.3	1.8	2.3	3.0	4.4
+15	0.8	1.4	1.8	2.3	3.0	3.7	5.1
+25	1.3	1.9	2.5	3.1	3.9	4.7	6.2
+35	2.0	2.8	3.4	4.2	5.1	6.0	8.0
+45	3.0	3.9	4.7	5.7	6.7	7.8	10.1
+55	4.3	5.4	6.3	7.6	8.8	10.3	12.9
+65	6.0	7.3	8.6	10.1	11.7	13.5	16.4
+75	8.3	9.9	11.5	13.3	15.3	17.4	21.2
+85	11.2	13.2	15.3	17.5	19.9	22.6	27.1
+95	15.2	17.6	20.1	22.9	26.1	29.4	34.6
+100	17.4	20.2	22.9	25.9	29.4	33.0	39.2
+105	20.0	23.0	26.1	29.5	33.4	N/A	N/A
+115	26.3	30.0	33.9	38.2	42.9	N/A	N/A
+125	34.4	38.9	43.6	48.8	54.8	N/A	N/A

[1] Valid temperature and voltage ranges are model-specific. See Operating Conditions.

Table 15. Dynamic Current in CCLK Domain—$I_{DD\_INT\_DYNAMIC}$ (mA, with ASF = 1.0)[1, 2]

f_{CCLK} (MHz)	Voltage (V_{DD_INT})						
	1.05 V	1.10 V	1.15 V	1.20 V	1.25 V	1.30 V	1.35 V
100	75	78	82	86	90	95	98
150	111	117	122	128	134	141	146
200	N/A	N/A	162	170	178	186	194
266	N/A	N/A	215	225	234	246	256
300	N/A	N/A	N/A	N/A	264	279	291

[1] The values are not guaranteed as standalone maximum specifications. They must be combined with static current per the equations of Electrical Characteristics.
[2] Valid frequency and voltage ranges are model-specific. See Operating Conditions.

MAXIMUM POWER DISSIPATION

See Engineer-to-Engineer Note "Estimating Power Dissipation for ADSP-2147x SHARC Processors" for detailed thermal and power information regarding maximum power dissipation. For information on package thermal specifications, see Thermal Characteristics.

PACKAGE INFORMATION

The information presented in Figure 4 provides details about the package branding. For a complete listing of product availability, see Ordering Guide.

Figure 4. Typical Package Brand

Table 16. Package Brand Information[1]

Brand Key	Field Description
t	Temperature Range
pp	Package Type
Z	RoHS Compliant Option
cc	See Ordering Guide
vvvvvv.x	Assembly Lot Code
n.n	Silicon Revision
#	RoHS Compliant Designation
yyww	Date Code

[1] Nonautomotive only. For branding information specific to automotive products, contact Analog Devices Inc.

ESD SENSITIVITY

ESD (electrostatic discharge) sensitive device.
Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

ABSOLUTE MAXIMUM RATINGS

Stresses greater than those listed in Table 17 may cause permanent damage to the device. These are stress ratings only; functional operation of the device at these or any other conditions greater than those indicated in Operating Conditions is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 17. Absolute Maximum Ratings

Parameter	Rating
Internal (Core) Supply Voltage (V_{DD_INT})	−0.3 V to +1.35 V
External (I/O) Supply Voltage (V_{DD_EXT})	−0.3 V to +4.6 V
Real Time Clock Voltage (V_{DD_RTC})	−0.3 V to +4.6 V
Thermal Diode Supply Voltage (V_{DD_THD})	−0.3 V to +4.6 V
Input Voltage	−0.5 V to +3.8 V
Output Voltage Swing	−0.5 V to V_{DD_EXT} +0.5 V
Storage Temperature Range	−65°C to +150°C
Junction Temperature While Biased	125°C

TIMING SPECIFICATIONS

Use the exact timing information given. Do not attempt to derive parameters from the addition or subtraction of others. While addition or subtraction would yield meaningful results for an individual device, the values given in this data sheet reflect statistical variations and worst cases. Consequently, it is not meaningful to add parameters to derive longer times. See Figure 49 under Test Conditions for voltage reference levels.

Switching Characteristics specify how the processor changes its signals. Circuitry external to the processor must be designed for compatibility with these signal characteristics. Switching characteristics describe what the processor will do in a given circumstance. Use switching characteristics to ensure that any timing requirement of a device connected to the processor (such as memory) is satisfied.

Timing Requirements apply to signals that are controlled by circuitry external to the processor, such as the data input for a read operation. Timing requirements guarantee that the processor operates correctly with other devices.

Core Clock Requirements

The processor's internal clock (a multiple of CLKIN) provides the clock signal for timing internal memory, processor core, and serial ports. During reset, program the ratio between the processor's internal clock frequency and external (CLKIN) clock frequency with the CLK_CFG1–0 pins.

The processor's internal clock switches at higher frequencies than the system input clock (CLKIN). To generate the internal clock, the processor uses an internal phase-locked loop (PLL, see Figure 5). This PLL-based clocking minimizes the skew between the system clock (CLKIN) signal and the processor's internal clock.

Voltage Controlled Oscillator (VCO)

In application designs, the PLL multiplier value should be selected in such a way that the VCO frequency never exceeds f_{VCO} specified in Table 20.

- The product of CLKIN and PLLM must never exceed 1/2 of f_{VCO} (max) in Table 20 if the input divider is not enabled (INDIV = 0).
- The product of CLKIN and PLLM must never exceed f_{VCO} (max) in Table 20 if the input divider is enabled (INDIV = 1).

The VCO frequency is calculated as follows:

$$f_{VCO} = 2 \times PLLM \times f_{INPUT}$$
$$f_{CCLK} = (2 \times PLLM \times f_{INPUT}) \div PLLD$$

where:

f_{VCO} = VCO output

PLLM = Multiplier value programmed in the PMCTL register. During reset, the PLLM value is derived from the ratio selected using the CLK_CFG pins in hardware.

PLLD = 2, 4, 8, or 16 based on the divider value programmed on the PMCTL register. During reset this value is 2.

f_{INPUT} is the input frequency to the PLL.

f_{INPUT} = CLKIN when the input divider is disabled, or CLKIN ÷ 2 when the input divider is enabled.

Note the definitions of the clock periods that are a function of CLKIN and the appropriate ratio control shown in Table 20. All of the timing specifications for the peripherals are defined in relation to t_{PCLK}. See the peripheral specific section for each peripheral's timing information.

Table 18. Clock Periods

Timing Requirements	Description
t_{CK}	CLKIN Clock Period
t_{CCLK}	Processor Core Clock Period
t_{PCLK}	Peripheral Clock Period = $2 \times t_{CCLK}$
t_{SDCLK}	SDRAM Clock Period = (t_{CCLK}) × SDCKR

Figure 5 shows core to CLKIN relationships with an external oscillator or crystal. The shaded divider/multiplier blocks denote where clock ratios can be set through hardware or software using the power management control register (PMCTL). For more information, see the *ADSP-214xx SHARC Processor Hardware Reference*.
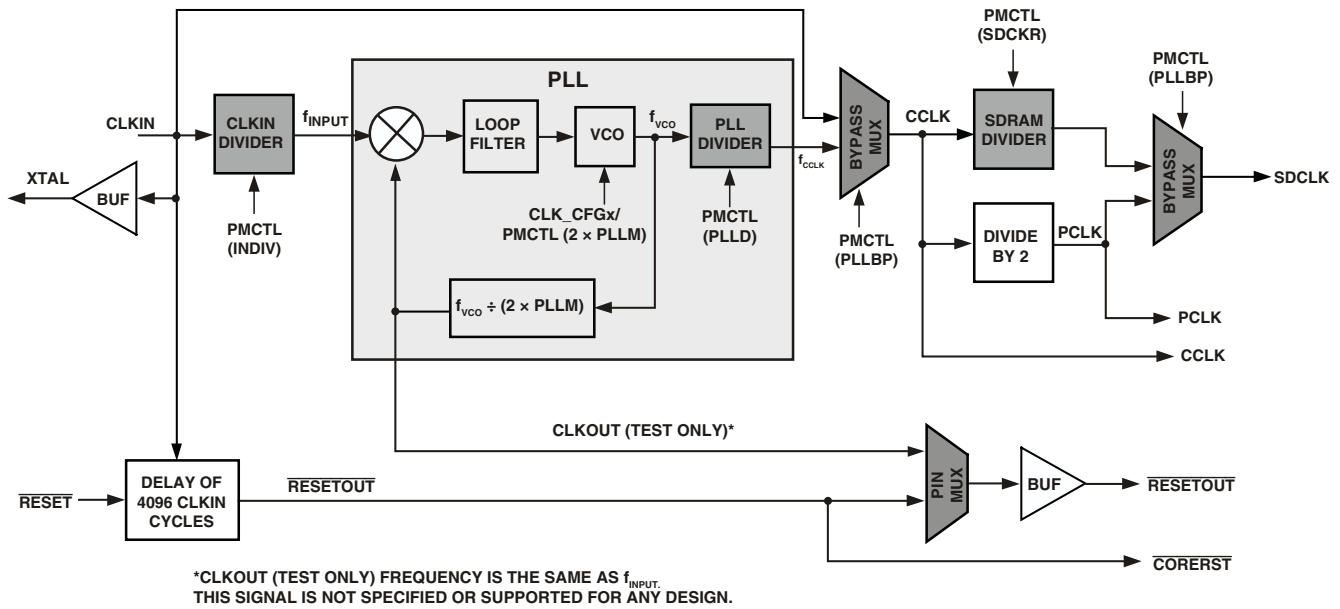

Figure 5. Core Clock and System Clock Relationship to CLKIN

*CLKOUT (TEST ONLY) FREQUENCY IS THE SAME AS f_{INPUT}.
THIS SIGNAL IS NOT SPECIFIED OR SUPPORTED FOR ANY DESIGN.

Power-Up Sequencing

The timing requirements for processor startup are given in Table 19. While no specific power-up sequencing is required between V_{DD_EXT} and V_{DD_INT}, there are some considerations that the system designs should take into account.

- No power supply should be powered up for an extended period of time (>200 ms) before another supply starts to ramp up.

- If the V_{DD_INT} power supply comes up after V_{DD_EXT}, any pin, such as $\overline{RESETOUT}$ and $\overline{RESET}$, may actually drive momentarily until the V_{DD_INT} rail has powered up. Systems sharing these signals on the board must determine if there are any issues that need to be addressed based on this behavior.

Note that during power-up, when the V_{DD_INT} power supply comes up after V_{DD_EXT}, a leakage current of the order of three-state leakage current pull-up, pull-down, may be observed on any pin, even if that is an input only (for example, the $\overline{RESET}$ pin), until the V_{DD_INT} rail has powered up.

Table 19. Power-Up Sequencing Timing Requirements (Processor Startup)

Parameter		Min	Max	Unit
Timing Requirements				
t_{RSTVDD}	$\overline{RESET}$ Low Before V_{DD_EXT} or V_{DD_INT} On	0		ms
$t_{IVDDEVDD}$	V_{DD_INT} On Before V_{DD_EXT}	−200	+200	ms
t_{CLKVDD}[1]	CLKIN Valid After V_{DD_INT} and V_{DD_EXT} Valid	0	200	ms
t_{CLKRST}	CLKIN Valid Before $\overline{RESET}$ Deasserted	10[2]		µs
t_{PLLRST}	PLL Control Setup Before $\overline{RESET}$ Deasserted	20[3]		µs
Switching Characteristic				
$t_{CORERST}$	Core Reset Deasserted After $\overline{RESET}$ Deasserted	$4096 \times t_{CK} + 2 \times t_{CCLK}$ [4, 5]		

[1] Valid V_{DD_INT} and V_{DD_EXT} assumes that the supplies are fully ramped to their nominal values (it does not matter which supply comes up first). Voltage ramp rates can vary from microseconds to hundreds of milliseconds depending on the design of the power supply subsystem.

[2] Assumes a stable CLKIN signal, after meeting worst-case startup timing of crystal oscillators. Refer to your crystal oscillator manufacturer's data sheet for startup time. Assume a 25 ms maximum oscillator startup time if using the XTAL pin and internal oscillator circuit in conjunction with an external crystal.

[3] Based on CLKIN cycles.

[4] Applies after the power-up sequence is complete. Subsequent resets require a minimum of four CLKIN cycles for $\overline{RESET}$ to be held low in order to properly initialize and propagate default states at all I/O pins.

[5] The 4096 cycle count depends on t_{SRST} specification in Table 21. If setup time is not met, one additional CLKIN cycle may be added to the core reset time, resulting in 4097 cycles maximum.

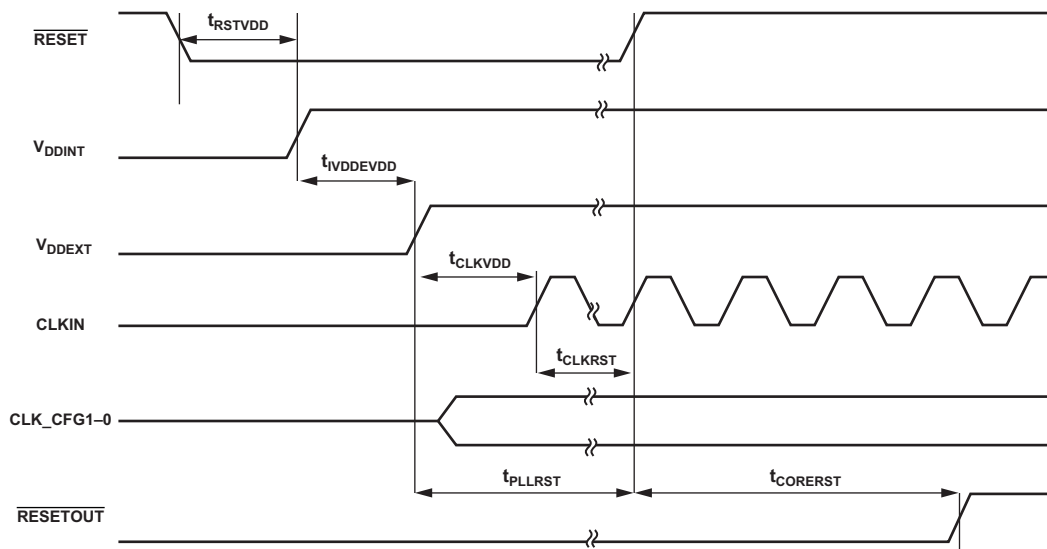

Figure 6. Power-Up Sequencing

ADSP-21477/ADSP-21478/ADSP-21479

Clock Input

Table 20. Clock Input

Parameter		200 MHz Min	200 MHz Max	266 MHz Min	266 MHz Max	300 MHz Min	300 MHz Max	Unit
Timing Requirements								
t_{CK}	CLKIN Period	40	100	30[1]	100	26.66[1]	100	ns
t_{CKL}	CLKIN Width Low	20	45	15	45	13.33	45	ns
t_{CKH}	CLKIN Width High	20	45	15	45	13.33	45	ns
t_{CKRF}	CLKIN Rise/Fall (0.4 V to 2.0 V)		3		3		3	ns
t_{CCLK}[2]	CCLK Period	5	10	3.75	10	3.33	10	ns
f_{VCO}[3]	VCO Frequency	200	600	200	600	200	600	MHz
t_{CKJ}[4, 5]	CLKIN Jitter Tolerance	−250	+250	−250	+250	−250	+250	ps

[1] Applies only for CLKCFG1–0 = 00 and default values for PLL control bits in PMCTL.
[2] Any changes to PLL control bits in the PMCTL register must meet core clock timing specification t_{cclk}.
[3] See Figure 5 for VCO diagram.
[4] Actual input jitter should be combined with ac specifications for accurate timing analysis.
[5] Jitter specification is maximum peak-to-peak time interval error (TIE) jitter.
Figure 7. Clock Input

Clock Signals

The processors can use an external clock or a crystal. See the CLKIN pin description in Table 11. Programs can configure the processor to use its internal clock generator by connecting the necessary components to CLKIN and XTAL. Figure 8 shows the component connections used for a crystal operating in funda-mental mode. Note that the clock rate is achieved using a 16.67 MHz crystal and a PLL multiplier ratio 16:1 (CCLK:CLKIN achieves a clock speed of 266 MHz). To achieve the full core clock rate, programs need to configure the multi-plier bits in the PMCTL register.

CHOOSE C1 AND C2 BASED ON THE CRYSTAL Y1.
CHOOSE R2 TO LIMIT CRYSTAL DRIVE POWER.

*TYPICAL VALUES
Figure 8. 266 MHz Operation (Fundamental Mode Crystal)

Reset

Table 21. Reset

Parameter		Min	Max	Unit
Timing Requirements				
t_{WRST}[1]	$\overline{RESET}$ Pulse Width Low	$4 \times t_{CK}$		ns
t_{SRST}	$\overline{RESET}$ Setup Before CLKIN Low	8		ns

[1] Applies after the power-up sequence is complete. At power-up, the processor's internal phase-locked loop requires no more than 100 μs while $\overline{RESET}$ is low, assuming stable V_{DD} and CLKIN (not including start-up time of external clock oscillator).
Figure 9. Reset

ADSP-21477/ADSP-21478/ADSP-21479

Running Reset

The following timing specification applies to $\overline{\text{RESETOUT}}$/$\overline{\text{RUNRSTIN}}$ pin when it is configured as $\overline{\text{RUNRSTIN}}$.

Table 22. Running Reset

Parameter		Min	Max	Unit
Timing Requirements				
$t_{WRUNRST}$	Running $\overline{\text{RESET}}$ Pulse Width Low	$4 \times t_{CK}$		ns
$t_{SRUNRST}$	Running $\overline{\text{RESET}}$ Setup Before CLKIN High	8		ns
Figure 10. Running Reset

Interrupts

The following timing specification applies to the FLAG0, FLAG1, and FLAG2 pins when they are configured as $\overline{\text{IRQ0}}$, $\overline{\text{IRQ1}}$, and $\overline{\text{IRQ2}}$ interrupts, as well as the DAI_P20–1 and DPI_P14–1 pins when they are configured as interrupts.

Table 23. Interrupts

Parameter		Min	Max	Unit
Timing Requirement				
t_{IPW}	$\overline{\text{IRQx}}$ Pulse Width	$2 \times t_{PCLK} + 2$		ns
Figure 11. Interrupts

Core Timer

The following timing specification applies to FLAG3 when it is configured as the core timer (TMREXP).

Table 24. Core Timer

Parameter	88-Lead LFCSP Package		All Other Packages		Unit
	Min	Max	Min	Max	
Switching Characteristic					
t_{WCTIM} TMREXP Pulse Width	$4 \times t_{PCLK} - 1.55$		$4 \times t_{PCLK} - 1.2$		ns
Figure 12. Core Timer

Timer PWM_OUT Cycle Timing

The following timing specification applies to timer0 and timer1 in PWM_OUT (pulse-width modulation) mode. Timer signals are routed to the DPI_P14–1 pins through the DPI SRU. Therefore, the timing specifications provided below are valid at the DPI_P14–1 pins.

Table 25. Timer PWM_OUT Timing

| Parameter	88-Lead LFCSP Package		All Other Packages		Unit
	Min	Max	Min	Max	
Switching Characteristic					
t_{PWMO} Timer Pulse Width Output	$2 \times t_{PCLK} - 1.65$	$2 \times (2^{31} - 1) \times t_{PCLK}$	$2 \times t_{PCLK} - 1.2$	$2 \times (2^{31} - 1) \times t_{PCLK}$	ns

Figure 13. Timer PWM_OUT Timing

Timer WDTH_CAP Timing

The following timing specification applies to timer0 and timer1, and in WDTH_CAP (pulse width count and capture) mode. Timer signals are routed to the DPI_P14–1 pins through the SRU. Therefore, the timing specification provided below is valid at the DPI_P14–1 pins.

Table 26. Timer Width Capture Timing

Parameter		Min	Max	Unit
Timing Requirement				
t_{PWI}	Timer Pulse Width	$2 \times t_{PCLK}$	$2 \times (2^{31} - 1) \times t_{PCLK}$	ns
Figure 14. Timer Width Capture Timing

Watchdog Timer Timing

Table 27. Watchdog Timer Timing

Parameter		Min	Max	Unit
Timing Requirement				
$t_{WDTCLKPER}$		100	1000	ns
Switching Characteristics				
t_{RST}	WDT Clock Rising Edge to Watchdog Timer $\overline{RESET}$ Falling Edge	3	7.6	ns
t_{RSTPW}	Reset Pulse Width	$64 \times t_{WDTCLKPER}$[1]		ns

[1] When the internal oscillator is used, the $1/t_{WDTCLKPER}$ varies from 1.5 MHz to 2.5 MHz and the WDT_CLKIN pin should be pulled low.

Figure 15. Watchdog Timer Timing

Pin to Pin Direct Routing (DAI and DPI)

For direct pin connections only (for example, DAI_PB01_I to DAI_PB02_O).

Table 28. DAI/DPI Pin to Pin Routing

| Parameter		Min	Max	Unit
Timing Requirement				
t_{DPIO}	Delay DAI/DPI Pin Input Valid to DAI/DPI Output Valid	1.5	10	ns

Figure 16. DAI Pin to Pin Direct Routing

Precision Clock Generator (Direct Pin Routing)

This timing is only valid when the SRU is configured such that the precision clock generator (PCG) takes its inputs directly from the DAI pins (via pin buffers) and sends its outputs directly to the DAI pins. For the other cases, where the PCG's inputs and outputs are not directly routed to/from DAI pins (via pin buffers) there is no timing data available. All timing parameters and switching characteristics apply to external DAI pins (DAI_P01 – DAI_P20).

Table 29. Precision Clock Generator (Direct Pin Routing)

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{PCGIP}	Input Clock Period	$t_{PCLK} \times 4$		$t_{PCLK} \times 4$		ns
t_{STRIG}	PCG Trigger Setup Before Falling Edge of PCG Input Clock	4.5		4.5		ns
t_{HTRIG}	PCG Trigger Hold After Falling Edge of PCG Input Clock	3		3		ns
Switching Characteristics						
t_{DPCGIO}	PCG Output Clock and Frame Sync Active Edge Delay After PCG Input Clock	2.5	$2 \times t_{PCLK}$	2.5	12.5	ns
$t_{DTRIGCLK}$	PCG Output Clock Delay After PCG Trigger	$2.5 + (2.5 \times t_{PCGIP})$	$2 \times t_{PCLK} + (2.5 \times t_{PCGIP})$	$2.5 + (2.5 \times t_{PCGIP})$	$12.5 + (2.5 \times t_{PCGIP})$	ns
$t_{DTRIGFS}$	PCG Frame Sync Delay After PCG Trigger	$2.5 + ((2.5 + D - PH) \times t_{PCGIP})$	$2 \times t_{PCLK} + ((2.5 + D - PH) \times t_{PCGIP})$	$2.5 + ((2.5 + D - PH) \times t_{PCGIP})$	$12.5 + ((2.5 + D - PH) \times t_{PCGIP})$	ns
t_{PCGOW}[1]	Output Clock Period	$2 \times t_{PCGIP} - 1$		$2 \times t_{PCGIP} - 1$		ns

D = FSxDIV, PH = FSxPHASE. For more information, see the ADSP-214xx SHARC Processor Hardware Reference, "Precision Clock Generators" chapter.
[1] Normal mode of operation.

Figure 17. Precision Clock Generator (Direct Pin Routing)

Flags

The timing specifications provided below apply to ADDR23–0 and DATA7–0 when configured as FLAGS. See Table 11 for more information on flag use.

Table 30. Flags

Parameter		Min	Max	Unit
Timing Requirement				
t_{FIPW}	FLAGs IN Pulse Width[1]	$2 \times t_{PCLK} + 3$		ns
Switching Characteristic				
t_{FOPW}	FLAGs OUT Pulse Width[1]	$2 \times t_{PCLK} - 3.5$		ns

[1] This is applicable when the Flags are connected to DPI_P14–1, ADDR23–0, DATA7–0 and FLAG3–0 pins.

Figure 18. Flags

SDRAM Interface Timing

Table 31. SDRAM Interface Timing

Parameter		133 MHz Min	133 MHz Max	150 MHz Min	150 MHz Max	Unit
Timing Requirements						
t_{SSDAT}	DATA Setup Before SDCLK	0.7		0.7		ns
t_{HSDAT}	DATA Hold After SDCLK	1.66		1.5		ns
Switching Characteristics						
t_{SDCLK}[1]	SDCLK Period	7.5		6.66		ns
t_{SDCLKH}	SDCLK Width High	2.5		2.2		ns
t_{SDCLKL}	SDCLK Width Low	2.5		2.2		ns
t_{DCAD}[2]	Command, ADDR, Data Delay After SDCLK		5		4.75	ns
t_{HCAD}[2]	Command, ADDR, Data Hold After SDCLK	1		1		ns
t_{DSDAT}	Data Disable After SDCLK		6.2		5.3	ns
t_{ENSDAT}	Data Enable After SDCLK	0.3		0.3		ns

[1] Systems should use the SDRAM model with a speed grade higher than the desired SDRAM controller speed. For example, to run the SDRAM controller at 133 MHz the SDRAM model with a speed grade of 143 MHz or above should be used. See Engineer-to-Engineer Note "Interfacing SDRAM memory to SHARC processors (EE-286)" for more information on hardware design guidelines for the SDRAM interface.
[2] Command pins include: $\overline{SDCAS}$, $\overline{SDRAS}$, $\overline{SDWE}$, $\overline{MSx}$, SDA10, SDQM, SDCKE.

Figure 19. SDRAM Interface Timing

AMI Read

Use these specifications for asynchronous interfacing to memories. Note that timing for AMI_ACK, ADDR, DATA, $\overline{\text{AMI\_RD}}$, $\overline{\text{AMI\_WR}}$, and strobe timing parameters only apply to asynchronous access mode.

Table 32. AMI Read

Parameter		Min	Max	Unit
Timing Requirements				
t_{DAD}[1, 2, 3]	Address Selects Delay to Data Valid		$W + t_{SDCLK} - 6.32$	ns
t_{DRLD}[1, 3]	$\overline{\text{AMI\_RD}}$ Low to Data Valid		$W - 3$	ns
t_{SDS}[4, 5]	Data Setup to $\overline{\text{AMI\_RD}}$ High	2.6		ns
t_{HDRH}	Data Hold from $\overline{\text{AMI\_RD}}$ High	0.4		ns
t_{DAAK}[2, 6]	AMI_ACK Delay from Address Selects		$t_{SDCLK} - 10 + W$	ns
t_{DSAK}[4]	AMI_ACK Delay from $\overline{\text{AMI\_RD}}$ Low		$W - 7.0$	ns
Switching Characteristics				
t_{DRHA}	Address Selects Hold After $\overline{\text{AMI\_RD}}$ High	$RHC + 0.38$		ns
t_{DARL}[2]	Address Selects to $\overline{\text{AMI\_RD}}$ Low	$t_{SDCLK} - 5$		ns
t_{RW}	$\overline{\text{AMI\_RD}}$ Pulse Width	$W - 1.4$		ns
t_{RWR}	$\overline{\text{AMI\_RD}}$ High to $\overline{\text{AMI\_RD}}$ Low	$HI + t_{SDCLK} - 1.2$		ns

W = (number of wait states specified in AMICTLx register) $\times$ t_{SDCLK}.
RHC = (number of Read Hold Cycles specified in AMICTLx register) $\times$ t_{SDCLK}
  Where PREDIS = 0
    HI = RHC (if IC = 0): Read to Read from same bank
    HI = RHC+ t_{SDCLK} (if IC > 0): Read to Read from same bank
    HI = RHC + IC: Read to Read from different bank
    HI = RHC + Max (IC, (4 $\times$ t_{SDCLK})): Read to Write from same or different bank
  Where PREDIS = 1
    HI = RHC + Max (IC, (4 $\times$ t_{SDCLK})): Read to Write from same or different bank
    HI = RHC + (3 $\times$ t_{SDCLK}): Read to Read from same bank
    HI = RHC + Max (IC, (3 $\times$ t_{SDCLK})): Read to Read from different bank
IC = (number of idle cycles specified in AMICTLx register) $\times$ t_{SDCLK}
H = (number of hold cycles specified in AMICTLx register) $\times$ t_{SDCLK}.

[1] Data delay/setup: System must meet t_{DAD}, t_{DRLD}, or $t_{SDS.}$
[2] The falling edge of $\overline{\text{AMI\_MSx}}$, is referenced.
[3] The maximum limit of timing requirement values for t_{DAD} and t_{DRLD} parameters are applicable for the case where AMI_ACK is always high and when the ACK feature is not used.
[4] Note that timing for AMI_ACK, ADDR, DATA, $\overline{\text{AMI\_RD}}$, $\overline{\text{AMI\_WR}}$, and strobe timing parameters only apply to asynchronous access mode.
[5] Data hold: User must meet t_{HDRH} in asynchronous access mode. See Test Conditions for the calculation of hold times given capacitive and dc loads.
[6] AMI_ACK delay/setup: User must meet t_{daak}, or t_{dsak}, for deassertion of AMI_ACK (low).

Figure 20. AMI Read

AMI Write

Use these specifications for asynchronous interfacing to memories. Note that timing for AMI_ACK, ADDR, DATA, $\overline{\text{AMI\_RD}}$, $\overline{\text{AMI\_WR}}$, and strobe timing parameters only apply to asynchronous access mode.

Table 33. AMI Write

Parameter		Min	Max	Unit
Timing Requirements				
t_{DAAK}	AMI_ACK Delay from Address Selects[1, 2]		$t_{SDCLK} - 10.1 + W$	ns
t_{DSAK}	AMI_ACK Delay from $\overline{\text{AMI\_WR}}$ Low[1, 3]		$W - 7.1$	ns
Switching Characteristics				
t_{DAWH}	Address Selects to $\overline{\text{AMI\_WR}}$ Deasserted[2]	$t_{SDCLK} - 4.4 + W$		ns
t_{DAWL}	Address Selects to $\overline{\text{AMI\_WR}}$ Low[2]	$t_{SDCLK} - 4.5$		ns
t_{WW}	$\overline{\text{AMI\_WR}}$ Pulse Width	$W - 1.3$		ns
t_{DDWH}	Data Setup Before $\overline{\text{AMI\_WR}}$ High	$t_{SDCLK} - 4.3 + W$		ns
t_{DWHA}	Address Hold After $\overline{\text{AMI\_WR}}$ Deasserted	H		ns
t_{DWHD}	Data Hold After $\overline{\text{AMI\_WR}}$ Deasserted	H		ns
t_{DATRWH}	Data Disable After $\overline{\text{AMI\_WR}}$ Deasserted[4]	$t_{SDCLK} - 1.37 + H$	$t_{SDCLK} + 6.75 + H$	ns
t_{WWR}	$\overline{\text{AMI\_WR}}$ High to $\overline{\text{AMI\_WR}}$ Low[5]	$t_{SDCLK} - 1.5 + H$		ns
t_{DDWR}	Data Disable Before $\overline{\text{AMI\_RD}}$ Low	$2 \times t_{SDCLK} - 7.1$		ns
t_{WDE}	Data Enabled to $\overline{\text{AMI\_WR}}$ Low	$t_{SDCLK} - 4.5$		ns

W = (number of wait states specified in AMICTLx register) × t_{SDCLK}
H = (number of hold cycles specified in AMICTLx register) × t_{SDCLK}

[1] AMI_ACK delay/setup: System must meet t_{DAAK}, or t_{DSAK}, for deassertion of AMI_ACK (low).
[2] The falling edge of $\overline{\text{AMI\_MSx}}$ is referenced.
[3] Note that timing for AMI_ACK, ADDR, DATA, $\overline{\text{AMI\_RD}}$, $\overline{\text{AMI\_WR}}$, and strobe timing parameters only applies to asynchronous access mode.
[4] See Test Conditions for calculation of hold times given capacitive and dc loads.
[5] For Write to Write: $t_{SDCLK} + H$, for both same bank and different bank. For Write to Read: $3 \times t_{SDCLK} + H$, for the same bank and different banks.
Figure 21. AMI Write

Serial Ports

In slave transmitter mode and master receiver mode, the maximum serial port frequency is $f_{PCLK}/8$. In master transmitter mode and slave receiver mode, the maximum serial port clock frequency is $f_{PCLK}/4$.

To determine whether communication is possible between two devices at clock speed, n, the following specifications must be confirmed: 1) frame sync delay and frame sync setup and hold, 2) data delay and data setup and hold, and 3) SCLK width.

Serial port signals (SCLK, FS, Data Channel A, Data Channel B) are routed to the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20–1 pins.

Table 34. Serial Ports—External Clock

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{SFSE}[1]	Frame Sync Setup Before SCLK (Externally Generated Frame Sync in Either Transmit or Receive Mode)	4		2.5		ns
t_{HFSE}[1]	Frame Sync Hold After SCLK (Externally Generated Frame Sync in Either Transmit or Receive Mode)	4		2.5		ns
t_{SDRE}[1]	Receive Data Setup Before Receive SCLK	4		2.5		ns
t_{HDRE}[1]	Receive Data Hold After SCLK	4		2.5		ns
t_{SCLKW}	SCLK Width	$(t_{PCLK} \times 4) \div 2 - 1.5$		$(t_{PCLK} \times 4) \div 2 - 1.5$		ns
t_{SCLK}	SCLK Period	$t_{PCLK} \times 4$		$t_{PCLK} \times 4$		ns
Switching Characteristics						
t_{DFSE}[2]	Frame Sync Delay After SCLK (Internally Generated Frame Sync in Either Transmit or Receive Mode)		15		15	ns

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Switching Characteristics						
$t_{DDTLFSE}$[1]	Data Delay from Late External Transmit Frame Sync or External Receive Frame Sync with MCE = 1, MFD = 0		$2 \times t_{PCLK}$		13.5	ns
$t_{DDTENFS}$[1]	Data Enable for MCE = 1, MFD = 0	0.5		0.5		ns

[1] The $t_{DDTLFSE}$ and $t_{DDTENFS}$ parameters apply to left-justified as well as DSP serial mode, and MCE = 1, MFD = 0.

Figure 23. External Late Frame Sync[1]

[1] This figure reflects changes made to support left-justified mode.

Table 37. Serial Ports—Enable and Three-State

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Switching Characteristics						
t_{DDTEN}[1]	Data Enable from External Transmit SCLK	2		2		ns
t_{DDTTE}[1]	Data Disable from External Transmit SCLK		23		20	ns
t_{DDTIN}[1]	Data Enable from Internal Transmit SCLK	−1		−1		ns

[1] Referenced to drive edge.
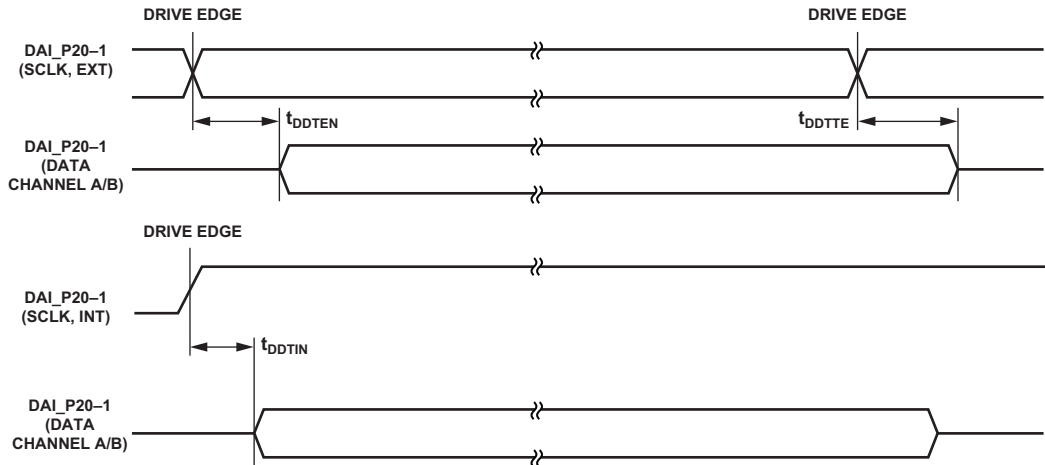

Figure 24. Enable and Three-State

The SPORTx_TDV_O output signal (routing unit) becomes active in SPORT multichannel/packed mode. During transmit slots (enabled with active channel selection registers), the SPORTx_TDV_O is asserted for communication with external devices.

Table 38. Serial Ports—TDV (Transmit Data Valid)

| Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Switching Characteristics[1]						
t_{DRDVEN}	TDV Assertion Delay from Drive Edge of External Clock	3		3		ns
t_{DFDVEN}	TDV Deassertion Delay from Drive Edge of External Clock		$2 \times t_{PCLK}$		13.25	ns
t_{DRDVIN}	TDV Assertion Delay from Drive Edge of Internal Clock	−0.1		−0.1		ns
t_{DFDVIN}	TDV Deassertion Delay from Drive Edge of Internal Clock		3.5		3.5	ns

[1] Referenced to drive edge.
Figure 25. Serial Ports—TDV Internal and External Clock

Input Data Port (IDP)

The timing requirements for the IDP are given in Table 39. IDP signals are routed to the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20–1 pins.

Table 39. Input Data Port (IDP)

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{SISFS}[1]	Frame Sync Setup Before Serial Clock Rising Edge	4.5		3.8		ns
t_{SIHFS}[1]	Frame Sync Hold After Serial Clock Rising Edge	3		2.5		ns
t_{SISD}[1]	Data Setup Before Serial Clock Rising Edge	4		2.5		ns
t_{SIHD}[1]	Data Hold After Serial Clock Rising Edge	3		2.5		ns
$t_{IDPCLKW}$	Clock Width	$(t_{PCLK} \times 4) \div 2 - 1$		$(t_{PCLK} \times 4) \div 2 - 1$		ns
t_{IDPCLK}	Clock Period	$t_{PCLK} \times 4$		$t_{PCLK} \times 4$		ns

[1] The serial clock, data, and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. The PCG's input can be either CLKIN or any of the DAI pins.

Figure 26. IDP Master Timing

Parallel Data Acquisition Port (PDAP)

The timing requirements for the PDAP are provided in Table 40. PDAP is the parallel mode operation of Channel 0 of the IDP. For details on the operation of the PDAP, see the PDAP chapter of the *ADSP-214xx SHARC Processor Hardware Reference*. Note that the 20 bits of external PDAP data can be provided through the ADDR23–0 pins or over the DAI pins.

Table 40. Parallel Data Acquisition Port (PDAP)

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{SPHOLD}[1]	PDAP_HOLD Setup Before PDAP_CLK Sample Edge	4		2.5		ns
t_{HPHOLD}[1]	PDAP_HOLD Hold After PDAP_CLK Sample Edge	4		2.5		ns
t_{PDSD}[1]	PDAP_DAT Setup Before SCLK PDAP_CLK Sample Edge	5		3.85		ns
t_{PDHD}[1]	PDAP_DAT Hold After SCLK PDAP_CLK Sample Edge	4		2.5		ns
t_{PDCLKW}	Clock Width	$(t_{PCLK} \times 4) \div 2 - 3$		$(t_{PCLK} \times 4) \div 2 - 3$		ns
t_{PDCLK}	Clock Period	$t_{PCLK} \times 4$		$t_{PCLK} \times 4$		ns
Switching Characteristics						
t_{PDHLDD}	Delay of PDAP Strobe After Last PDAP_CLK Capture Edge for a Word	$2 \times t_{PCLK} + 3$		$2 \times t_{PCLK} + 3$		ns
t_{PDSTRB}	PDAP Strobe Pulse Width	$2 \times t_{PCLK} - 1.5$		$2 \times t_{PCLK} - 1.5$		ns

[1] Source pins of DATA and control are ADDR23–0 or DAI pins. Source pins for SCLK and FS are: 1) DAI pins, 2) CLKIN through PCG, or 3) DAI pins through PCG.

Figure 27. PDAP Timing

Sample Rate Converter—Serial Input Port

The ASRC input signals are routed from the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided in Table 41 are valid at the DAI_P20–1 pins.

Table 41. ASRC, Serial Input Port

Parameter		Min	Max	Unit
Timing Requirements				
t_{SRCSFS}[1]	Frame Sync Setup Before Serial Clock Rising Edge	4		ns
t_{SRCHFS}[1]	Frame Sync Hold After Serial Clock Rising Edge	5.5		ns
t_{SRCSD}[1]	Data Setup Before Serial Clock Rising Edge	4		ns
t_{SRCHD}[1]	Data Hold After Serial Clock Rising Edge	5.5		ns
$t_{SRCCLKW}$	Clock Width	$(t_{PCLK} \times 4) \div 2 - 1$		ns
t_{SRCCLK}	Clock Period	$t_{PCLK} \times 4$		ns

[1] The serial clock, data, and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

Figure 28. ASRC Serial Input Port Timing

Sample Rate Converter—Serial Output Port

For the serial output port, the frame sync is an input, and it should meet setup and hold times with regard to the serial clock on the output port. The serial data output has a hold time and delay specification with regard to serial clock. Note that serial clock rising edge is the sampling edge and the falling edge is the drive edge.

Table 42. ASRC, Serial Output Port

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{SRCSFS}[1]	Frame Sync Setup Before Serial Clock Rising Edge	4		4		ns
t_{SRCHFS}[1]	Frame Sync Hold After Serial Clock Rising Edge	5.5		5.5		ns
$t_{SRCCLKW}$	Clock Width	$(t_{PCLK} \times 4) \div 2 - 1$		$(t_{PCLK} \times 4) \div 2 - 1$		ns
t_{SRCCLK}	Clock Period	$t_{PCLK} \times 4$		$t_{PCLK} \times 4$		ns
Switching Characteristics						
t_{SRCTDD}[1]	Transmit Data Delay After Serial Clock Falling Edge		$2 \times t_{PCLK}$		13	ns
t_{SRCTDH}[1]	Transmit Data Hold After Serial Clock Falling Edge	1		1		ns

[1] The serial clock, data, and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

Figure 29. ASRC Serial Output Port Timing

Pulse-Width Modulation Generators (PWM)

The following timing specifications apply when the ADDR23–8/DPI_14–1 pins are configured as PWM.

Table 43. Pulse-Width Modulation (PWM) Timing

| Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Switching Characteristics						
t_{PWMW}	PWM Output Pulse Width	$t_{PCLK} - 2$	$(2^{16} - 2) \times t_{PCLK}$	$t_{PCLK} - 2$	$(2^{16} - 2) \times t_{PCLK}$	ns
t_{PWMP}	PWM Output Period	$2 \times t_{PCLK} - 2$	$(2^{16} - 1) \times t_{PCLK}$	$2 \times t_{PCLK} - 1.5$	$(2^{16} - 1) \times t_{PCLK}$	ns

Figure 30. PWM Timing

ADSP-21477/ADSP-21478/ADSP-21479

S/PDIF Transmitter

Serial data input to the S/PDIF transmitter can be formatted as left-justified, I²S, or right-justified with word widths of 16, 18, 20, or 24 bits. The following sections provide timing for the transmitter.

S/PDIF Transmitter-Serial Input Waveforms

Figure 31 shows the right-justified mode. Frame sync is high for the left channel and low for the right channel. Data is valid on the rising edge of serial clock. The MSB is delayed the minimum in 24-bit output mode or the maximum in 16-bit output mode from a frame sync transition, so that when there are 64 serial clock periods per frame sync period, the LSB of the data is right-justified to the next frame sync transition.

Figure 32 shows the default I²S-justified mode. The frame sync is low for the left channel and high for the right channel. Data is valid on the rising edge of serial clock. The MSB is left-justified to the frame sync transition but with a delay.

Table 44. S/PDIF Transmitter Right-Justified Mode

Parameter		Nominal	Unit
Timing Requirement			
t_{RJD}	FS to MSB Delay in Right-Justified Mode		
	16-Bit Word Mode	16	SCLK
	18-Bit Word Mode	14	SCLK
	20-Bit Word Mode	12	SCLK
	24-Bit Word Mode	8	SCLK
Figure 31. Right-Justified Mode

Table 45. S/PDIF Transmitter I²S Mode

| Parameter		Nominal	Unit
Timing Requirement			
t_{I2SD}	FS to MSB Delay in I²S Mode	1	SCLK

Figure 32. I²S-Justified Mode

Figure 33 shows the left-justified mode. The frame sync is high for the left channel and low for the right channel. Data is valid on the rising edge of serial clock. The MSB is left-justified to the frame sync transition with no delay.

Table 46. S/PDIF Transmitter Left-Justified Mode

Parameter		Nominal	Unit
Timing Requirement			
t_{LJD}	FS to MSB Delay in Left-Justified Mode	0	SCLK
Figure 33. Left-Justified Mode

S/PDIF Transmitter Input Data Timing

The timing requirements for the S/PDIF transmitter are given in Table 47. Input signals are routed to the DAI_P20–1 pins using the SRU. Therefore, the timing specifications provided below are valid at the DAI_P20–1 pins.

Table 47. S/PDIF Transmitter Input Data Timing

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{SISFS}[1]	Frame Sync Setup Before Serial Clock Rising Edge	4.5		3		ns
t_{SIHFS}[1]	Frame Sync Hold After Serial Clock Rising Edge	3		3		ns
t_{SISD}[1]	Data Setup Before Serial Clock Rising Edge	4.5		3		ns
t_{SIHD}[1]	Data Hold After Serial Clock Rising Edge	3		3		ns
$t_{SITXCLKW}$	Transmit Clock Width	9		9		ns
$t_{SITXCLK}$	Transmit Clock Period	20		20		ns
$t_{SISCLKW}$	Clock Width	36		36		ns
t_{SISCLK}	Clock Period	80		80		ns

[1] The serial clock, data, and frame sync signals can come from any of the DAI pins. The serial clock and frame sync signals can also come via PCG or SPORTs. PCG's input can be either CLKIN or any of the DAI pins.

Figure 34. S/PDIF Transmitter Input Timing

Oversampling Clock (TxCLK) Switching Characteristics

The S/PDIF transmitter requires an oversampling clock input. This high frequency clock (TxCLK) input is divided down to generate the internal biphase clock.

Table 48. Oversampling Clock (TxCLK) Switching Characteristics

Parameter	Max	Unit
Frequency for TxCLK = 384 × Frame Sync	Oversampling Ratio × Frame Sync ≤ $1/t_{SITXCLK}$	MHz
Frequency for TxCLK = 256 × Frame Sync	49.2	MHz
Frame Rate (FS)	192.0	kHz

S/PDIF Receiver

The following section describes timing as it relates to the
S/PDIF receiver.

Internal Digital PLL Mode

In the internal digital phase-locked loop mode the internal PLL
(digital PLL) generates the 512 × FS clock.

Table 49. S/PDIF Receiver Internal Digital PLL Mode Timing

Parameter		Min	Max	Unit
Switching Characteristics				
t_{DFSI}	FS Delay After Serial Clock		5	ns
t_{HOFSI}	FS Hold After Serial Clock	−2		ns
t_{DDTI}	Transmit Data Delay After Serial Clock		5	ns
t_{HDTI}	Transmit Data Hold After Serial Clock	−2		ns
t_{SCLKIW}[1]	Transmit Serial Clock Width	38.5		ns

[1] The serial clock frequency is 64 × frame sync (FS) where FS = the frequency of LRCLK.

Figure 35. S/PDIF Receiver Internal Digital PLL Mode Timing

SPI Interface—Master

Both the primary and secondary SPIs are available through DPI only. The timing provided in Table 50 and Table 51 applies to both.

Table 50. SPI Interface Protocol—Master Switching and Timing Specifications

| Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
t_{SSPIDM}	Data Input Valid to SPICLK Edge (Data Input Setup Time)	10		8.6		ns
t_{HSPIDM}	SPICLK Last Sampling Edge to Data Input Not Valid	2		2		ns
Switching Characteristics						
$t_{SPICLKM}$	Serial Clock Cycle	$8 \times t_{PCLK} - 2$		$8 \times t_{PCLK} - 2$		ns
t_{SPICHM}	Serial Clock High Period	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 2$		ns
t_{SPICLM}	Serial Clock Low Period	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 2$		ns
$t_{DDSPIDM}$	SPICLK Edge to Data Out Valid (Data Out Delay time)		2.5		2.5	
$t_{HDSPIDM}$	SPICLK Edge to Data Out Not Valid (Data Out Hold time)	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 2$		ns
t_{SDSCIM}	DPI Pin (SPI Device Select) Low to First SPICLK Edge	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 2$		ns
t_{HDSM}	Last SPICLK Edge to DPI Pin (SPI Device Select) High	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 2$		ns
t_{SPITDM}	Sequential Transfer Delay	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 1.4$		ns

Figure 36. SPI Master Timing

SPI Interface—Slave

Table 51. SPI Interface Protocol—Slave Switching and Timing Specifications

Parameter		88-Lead LFCSP Package		All Other Packages		Unit
		Min	Max	Min	Max	
Timing Requirements						
$t_{SPICLKS}$	Serial Clock Cycle	$4 \times t_{PCLK} - 2$		$4 \times t_{PCLK} - 2$		ns
t_{SPICHS}	Serial Clock High Period	$2 \times t_{PCLK} - 2$		$2 \times t_{PCLK} - 2$		ns
t_{SPICLS}	Serial Clock Low Period	$2 \times t_{PCLK} - 2$		$2 \times t_{PCLK} - 2$		ns
t_{SDSCO}	$\overline{SPIDS}$ Assertion to First SPICLK Edge, CPHASE = 0 or CPHASE = 1	$2 \times t_{PCLK}$		$2 \times t_{PCLK}$		ns
t_{HDS}	Last SPICLK Edge to $\overline{SPIDS}$ Not Asserted, CPHASE = 0	$2 \times t_{PCLK}$		$2 \times t_{PCLK}$		ns
t_{SSPIDS}	Data Input Valid to SPICLK Edge (Data Input Setup Time)	2		2		ns
t_{HSPIDS}	SPICLK Last Sampling Edge to Data Input Not Valid	2		2		ns
t_{SDPPW}	$\overline{SPIDS}$ Deassertion Pulse Width (CPHASE = 0)	$2 \times t_{PCLK}$		$2 \times t_{PCLK}$		ns
Switching Characteristics						
t_{DSOE}	$\overline{SPIDS}$ Assertion to Data Out Active	0	13	0	10.25	ns
t_{DSOE}[1]	$\overline{SPIDS}$ Assertion to Data Out Active (SPI2)	0	13	0	10.25	ns
t_{DSDHI}	$\overline{SPIDS}$ Deassertion to Data High Impedance	0	$2 \times t_{PCLK}$	0	13.25	ns
t_{DSDHI}[1]	$\overline{SPIDS}$ Deassertion to Data High Impedance (SPI2)	0	$2 \times t_{PCLK}$	0	13.25	ns
$t_{DDSPIDS}$	SPICLK Edge to Data Out Valid (Data Out Delay Time)		13		11.5	ns
$t_{HDSPIDS}$	SPICLK Edge to Data Out Not Valid (Data Out Hold Time)	$2 \times t_{PCLK}$		$2 \times t_{PCLK}$		ns
t_{DSOV}	$\overline{SPIDS}$ Assertion to Data Out Valid (CPHASE = 0)		$5 \times t_{PCLK}$		$5 \times t_{PCLK}$	ns

[1] The timing for these parameters applies when the SPI is routed through the signal routing unit. For more information, see the processor hardware reference, "Serial Peripheral Interface Port (SPI)" chapter.

Figure 37. SPI Slave Timing

ADSP-21477/ADSP-21478/ADSP-21479

Media Local Bus

All the numbers given are applicable for all speed modes
(1024 FS, 512 FS, and 256 FS for 3-pin; 512 FS and 256 FS for
5-pin) unless otherwise specified. Please refer to MediaLB specification document rev 3.0 for more details.

Table 52. MLB Interface, 3-Pin Specifications

Parameter		Min	Typ	Max	Unit
3-Pin Characteristics					
t_{MLBCLK}	MLB Clock Period				
	1024 FS		20.3		ns
	512 FS		40		ns
	256 FS		81		ns
t_{MCKL}	MLBCLK Low Time				
	1024 FS	6.1			ns
	512 FS	14			ns
	256 FS	30			ns
t_{MCKH}	MLBCLK High Time				
	1024 FS	9.3			ns
	512 FS	14			ns
	256 FS	30			ns
t_{MCKR}	MLBCLK Rise Time (V_{IL} to V_{IH})				
	1024 FS			1	ns
	512 FS/256 FS			3	ns
t_{MCKF}	MLBCLK Fall Time (V_{IH} to V_{IL})				
	1024 FS			1	ns
	512 FS/256 FS			3	ns
t_{MPWV}[1]	MLBCLK Pulse Width Variation				
	1024 FS			0.7	ns p-p
	512 FS/256			2.0	ns p-p
t_{DSMCF}	DAT/SIG Input Setup Time	1			ns
t_{DHMCF}	DAT/SIG Input Hold Time	1.2			ns
t_{MCFDZ}	DAT/SIG Output Time to Three-State	0		15	ns
t_{MCDRV}	DAT/SIG Output Data Delay From MLBCLK Rising Edge			8	ns
t_{MDZH}[2]	Bus Hold Time				
	1024 FS	2			ns
	512 FS/256	4			ns
C_{MLB}	DAT/SIG Pin Load				
	1024 FS			40	pf
	512 FS/256			60	pf

[1] Pulse width variation is measured at 1.25 V by triggering on one edge of MLBCLK and measuring the spread on the other edge, measured in ns peak-to-peak (p-p).

[2] The board must be designed to ensure that the high impedance bus does not leave the logic state of the final driven bit for this time period. Therefore, coupling must be minimized while meeting the maximum capacitive load listed.
Figure 38. MLB Timing (3-Pin Interface)

Table 53. MLB Interface, 5-Pin Specifications

Parameter		Min	Typ	Max	Unit
5-Pin Characteristics					
t_{MLBCLK}	MLB Clock Period				
	512 FS		40		ns
	256 FS		81		ns
t_{MCKL}	MLBCLK Low Time				
	512 FS	15			ns
	256 FS	30			ns
t_{MCKH}	MLBCLK High Time				
	512 FS	15			ns
	256 FS	30			ns
t_{MCKR}	MLBCLK Rise Time (V_{IL} to V_{IH})			6	ns
t_{MCKF}	MLBCLK Fall Time (V_{IH} to V_{IL})			6	ns
t_{MPWV}[1]	MLBCLK Pulse Width Variation			2	ns p-p
t_{DSMCF}[2]	DAT/SIG Input Setup Time	3			ns
t_{DHMCF}	DAT/SIG Input Hold Time	5			ns
t_{MCDRV}	DS/DO Output Data Delay From MLBCLK Rising Edge			8	ns
t_{MCRDL}[3]	DO/SO Low From MLBCLK High				
	512 FS			10	ns
	256 FS			20	ns
C_{mlb}	DS/DO Pin Load			40	pf

[1] Pulse width variation is measured at 1.25 V by triggering on one edge of MLBCLK and measuring the spread on the other edge, measured in ns peak-to-peak (p-p).

[2] Gate delays due to OR'ing logic on the pins must be accounted for.

[3] When a node is not driving valid data onto the bus, the MLBSO and MLBDO output lines shall remain low. If the output lines can float at anytime, including while in reset, external pull-down resistors are required to keep the outputs from corrupting the MediaLB signal lines when not being driven.

$t_{DLDOCLR1}$[3]	$\overline{SR\_CLR}$ to SR_LDO Min. Delay	4		ns
$t_{DLDOCLR2}$[3]	$\overline{SR\_CLR}$ to SR_LDO Max. Delay		14	ns

[1] Any of the DAI_P08–01 pins can be routed to the shift register clock, latch clock and serial data input via the SRU.

[2] Both clocks can be connected to the same clock source. If both clocks are connected to same clock source, then data in the 18-stage shift register is always one cycle ahead of latch register data.

[3] For setup/hold timing requirements of off-chip shift register interfacing devices.

[4] SPORTx serial clock out, frame sync out, and serial data outputs are routed to shift register block internally and are also routed onto DAI_P20–01.

[5] PCG serial clock output is routed to SPORT and shift register block internally and are also routed onto DAI_P20–01. The SPORTs generate SR_LAT and SDI internally.

[6] PCG Serial clock and frame sync outputs are routed to SPORT and shift register block internally and are also routed onto DAI_P20–01. The SPORTs generate SDI internally.
Figure 41. SR_SDI Setup, Hold

THE TIMING PARAMETERS SHOWN FOR t_{DSDO1} AND t_{DSDO2} ARE VALID FOR $t_{DSDODAI1}$, $t_{DSDOSP1}$, $t_{DSDOPCG1}$, $t_{DSDODAI2}$, $t_{DSDOSP2}$, AND $t_{DSDOPCG2}$

Figure 42. SR_ SDO Delay

THE TIMING PARAMETERS SHOWN FOR t_{DLDO1} AND t_{DLDO2} ARE ALSO VALID FOR $t_{DLDODAI1}$, $t_{DLDODAI2}$, $t_{DLDOSP1}$, $t_{DLDOSP2}$, $t_{DLDOPCG1}$, AND $t_{DLDOPCG2}$.

Figure 47. Typical Drive at Junction Temperature

TEST CONDITIONS

The ac signal specifications (timing parameters) appear in Table 21 through Table 55. These include output disable time, output enable time, and capacitive loading. The timing specifications for the SHARC apply for the voltage reference levels in Figure 48.

Timing is measured on signals when they cross the 1.5 V level as described in Figure 49. All delays (in nanoseconds) are measured between the point that the first signal reaches 1.5 V and the point that the second signal reaches 1.5 V.
Figure 48. Equivalent Device Loading for AC Measurements (Includes All Fixtures)

Figure 49. Voltage Reference Levels for AC Measurements

CAPACITIVE LOADING

Output delays and holds are based on standard capacitive loads: 30 pF on all pins (see Figure 48). Figure 52 shows graphically how output delays and holds vary with load capacitance. The graphs of Figure 50, Figure 51, and Figure 52 may not be linear outside the ranges shown for Typical Output Delay vs. Load Capacitance and Typical Output Rise Time (20% to 80%, V = Min) vs. Load Capacitance.

Figure 50. Typical Output Rise/Fall Time (20% to 80%, $V_{DD\_EXT} = Max$)

Figure 51. Typical Output Rise/Fall Time (20% to 80%, V_{DD_EXT} = Min)

Figure 52. Typical Output Delay or Hold vs. Load Capacitance (at Ambient Temperature)

THERMAL CHARACTERISTICS

The processor is rated for performance over the temperature range specified in Operating Conditions.

Table 58 airflow measurements comply with JEDEC standards JESD51-2 and JESD51-6 and the junction-to-board measurement complies with JESD51-8. Test board design complies with JEDEC standards JESD51-7 (PBGA). The junction-to-case measurement complies with MIL- STD-883. All measurements use a 2S2P JEDEC test board.

To determine the junction temperature of the device while on the application PCB, use:

$$T_J = T_{CASE} + (\Psi_{JT} \times P_D)$$

where:

T_J = junction temperature (°C)

T_{CASE} = case temperature (°C) measured at the top center of the package

Ψ_{JT} = junction-to-top (of package) characterization parameter is the typical value from Table 58

P_D = power dissipation

Values of θ_{JA} are provided for package comparison and PCB design considerations. θ_{JA} can be used for a first order approximation of T_J by the equation:

$$T_J = T_A + (\theta_{JA} \times P_D)$$

where:

T_A = ambient temperature °C

Values of θ_{JC} are provided for package comparison and PCB design considerations when an external heatsink is required.

Note that the thermal characteristics values provided in Table 58 are modeled values.

Table 57. Thermal Characteristics for 88-Lead LFCSP_VQ

Parameter	Condition	Typical	Unit
θ_{JA}	Airflow = 0 m/s	22.6	°C/W
θ_{JMA}	Airflow = 1 m/s	18.2	°C/W
θ_{JMA}	Airflow = 2 m/s	17.3	°C/W
θ_{JC}		7.9	°C/W
Ψ_{JT}	Airflow = 0 m/s	0.22	°C/W
Ψ_{JMT}	Airflow = 1 m/s	0.36	°C/W
Ψ_{JMT}	Airflow = 2 m/s	0.44	°C/W

Table 58. Thermal Characteristics for 100-Lead LQFP_EP

Parameter	Condition	Typical	Unit
θ_{JA}	Airflow = 0 m/s	18.1	°C/W
θ_{JMA}	Airflow = 1 m/s	15.5	°C/W
θ_{JMA}	Airflow = 2 m/s	14.6	°C/W
θ_{JC}		2.4	°C/W
Ψ_{JT}	Airflow = 0 m/s	0.22	°C/W
Ψ_{JMT}	Airflow = 1 m/s	0.36	°C/W
Ψ_{JMT}	Airflow = 2 m/s	0.50	°C/W

Table 59. Thermal Characteristics for 196-Ball CSP_BGA

Parameter	Condition	Typical	Unit
θ_{JA}	Airflow = 0 m/s	29.0	°C/W
θ_{JMA}	Airflow = 1 m/s	26.1	°C/W
θ_{JMA}	Airflow = 2 m/s	25.1	°C/W
θ_{JC}		8.8	°C/W
Ψ_{JT}	Airflow = 0 m/s	0.23	°C/W
Ψ_{JMT}	Airflow = 1 m/s	0.42	°C/W
Ψ_{JMT}	Airflow = 2 m/s	0.52	°C/W

Thermal Diode

The processors incorporate thermal diode/s to monitor the die temperature. The thermal diode is a grounded collector, PNP bipolar junction transistor (BJT). The THD_P pin is connected to the emitter, and the THD_M pin is connected to the base of the transistor. These pins can be used by an external temperature sensor (such as ADM1021A or LM86 or others) to read the die temperature of the chip.

The technique used by the external temperature sensor is to measure the change in VBE when the thermal diode is operated at two different currents. This is shown in the following equation:

$$\Delta V_{BE} = n \times \frac{kT}{q} \times ln(N)$$

where:

n = multiplication factor close to 1, depending on process variations

k = Boltzmann constant

T = temperature (°C)

q = charge of the electron

N = ratio of the two currents

The two currents are usually in the range of 10 µA to 300 µA for the common temperature sensor chips available.

Table 60 contains the thermal diode specifications using the transistor model.

Table 60. Thermal Diode Parameters—Transistor Model[1]

Symbol	Parameter	Min	Typ	Max	Unit
I_{FW}[2]	Forward Bias Current	10		300	µA
I_E	Emitter Current	10		300	µA
n_Q[3, 4]	Transistor Ideality	1.012	1.015	1.017	
R_T[3, 5]	Series Resistance	0.12	0.2	0.28	Ω

[1] Analog Devices does not recommend operation of the thermal diode under reverse bias.

[2] Analog Devices does not recommend operation of the thermal diode under reverse bias.

[3] Specified by design characterization.

[4] The ideality factor, nQ, represents the deviation from ideal diode behavior as exemplified by the diode equation: $I_C = I_S \times (e^{qVBE/nqkT} - 1)$ where I_S = saturation current, q = electronic charge, V_{BE} = voltage across the diode, k = Boltzmann constant, and T = absolute temperature (Kelvin).

[5] The series resistance (R_T) can be used for more accurate readings as needed.

88-LFCSP_VQ LEAD ASSIGNMENT

Table 61 lists the 88-Lead LFCSP_VQ package lead names.

Table 61. 88-Lead LFCSP_VQ Lead Assignments (Numerical by Lead Number)

SURFACE-MOUNT DESIGN

For industry-standard design recommendations, refer to IPC-7351, Generic Requirements for Surface-Mount Design and Land Pattern Standard.

AUTOMOTIVE PRODUCTS

The ADSP-21477, ADSP-21478, and ADSP-21479 are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models, and designers should review the product Specifications section of this data sheet carefully.

Only the automotive grade products shown in Table 64 are available for use in automotive applications. Contact your local ADI account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.

Model[1]	Temperature Range[2]	On-Chip SRAM	Processor Instruction Rate (Max)	Package Description	Package Option
ADSP-21477KCPZ-1A	0°C to +70°C	2M Bits	200 MHz	88-Lead LFCSP_VQ	CP-88-5
ADSP-21477KSWZ-1A	0°C to +70°C	2M Bits	200 MHz	100-Lead LQFP_EP	SW-100-2
ADSP-21477BCPZ-1A	−40°C to +85°C	2M Bits	200 MHz	88-Lead LFCSP_VQ	CP-88-5
ADSP-21478KCPZ-1A	0°C to +70°C	3M Bits	200 MHz	88-Lead LFCSP_VQ	CP-88-5
ADSP-21478BCPZ-1A	−40°C to +85°C	3M Bits	200 MHz	88-Lead LFCSP_VQ	CP-88-5
ADSP-21478BBCZ-2A	−40°C to +85°C	3M Bits	266 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21478BSWZ-2A	−40°C to +85°C	3M Bits	266 MHz	100-Lead LQFP_EP	SW-100-2
ADSP-21478KBCZ-1A	0°C to +70°C	3M Bits	200 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21478KBCZ-2A	0°C to +70°C	3M Bits	266 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21478KBCZ-3A	0°C to +70°C	3M Bits	300 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21478KSWZ-1A	0°C to +70°C	3M Bits	200 MHz	100-Lead LQFP_EP	SW-100-2
ADSP-21478KSWZ-2A	0°C to +70°C	3M Bits	266 MHz	100-Lead LQFP_EP	SW-100-2
ADSP-21479KCPZ-1A	0°C to +70°C	5M Bits	200 MHz	88-Lead LFCSP_VQ	CP-88-5
ADSP-21479BCPZ-1A	−40°C to +85°C	5M Bits	200 MHz	88-Lead LFCSP_VQ	CP-88-5
ADSP-21479BBCZ-2A	−40°C to +85°C	5M Bits	266 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21479BSWZ-2A	−40°C to +85°C	5M Bits	266 MHz	100-Lead LQFP_EP	SW-100-2
ADSP-21479KBCZ-1A	0°C to +70°C	5M Bits	200 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21479KBCZ-2A	0°C to +70°C	5M Bits	266 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21479KBCZ-3A	0°C to +70°C	5M Bits	300 MHz	196-Ball CSP_BGA	BC-196-8
ADSP-21479KSWZ-1A	0°C to +70°C	5M Bits	200 MHz	100-Lead LQFP_EP	SW-100-2
ADSP-21479KSWZ-2A	0°C to +70°C	5M Bits	266 MHz	100-Lead LQFP_EP	SW-100-2

[1] Z =RoHS compliant part.

[2] Referenced temperature is ambient temperature. The ambient temperature is not a specification. Please see Operating Conditions for junction temperature (T_J) specification, which is the only temperature specification.
