

10 GHz LATCHED COMPARATOR WITH RSECL OUTPUT STAGE

Typical Applications

The HMC676LP3E is ideal for:

- ATE Applications
- High Speed Instrumentation
- Digital Receiver Systems
- Pulse Spectroscopy
- High Speed Trigger Circuits
- Clock & Data Restoration

Functional Diagram

Features

Equivalent Input Bandwidth: 10 GHz

Propagation Delay: 100 ps

Overdrive & Slew Rate Dispersion: 10 ps

Minimum Pulse Width: 60 ps

Resistor Programmable Hysteresis

Differential Latch Control

Power Dissipation: 120 mW

RSCML and RSPECL Versions Available

16 Lead 3x3 mm SMT Package: 9 mm²

General Description

The HMC676LP3E is a SiGe monolithic, ultra fast comparator that features reduced swing (RS) ECL output drivers and latch inputs. The comparator supports 10 Gbps operation while providing 100 ps propagation delay and 60 ps minimum pulse width with 0.2 ps rms random jitter (RJ). Overdrive and slew rate dispersion are typically 10 ps, making the device ideal for a wide range of applications from ATE to broadband communications. The reduced swing ECL output stage is designed to directly drive 400 mV into 50 ohms terminated to -2 V. The HMC676LP3E features high speed latch and programmable hysteresis and may be configured to operate in either latch mode, or as a tracking comparator.

Electrical Specifications, $T_A = +25^\circ\text{C}$, $V_{CCI} = +3.3\text{ V}$, $V_{CCO} = 0\text{ V}$, $V_{EE} = -3\text{ V}$, $V_{TERM} = -2\text{ V}$

Parameter	Conditions	Min.	Typ.	Max	Units
Input Voltage Range		-2		2	V
Input Differential Voltage		-1.75		1.75	V
Input Offset Voltage			±5		mV
Input Offset Voltage, Temperature Coefficient			15		μV / °C
Input Bias Current			15		uA
Input Bias Current Temperature Coefficient			50		nA / °C
Input Offset Current			4		μA
Input Impedance			50		Ω
Common Mode Input Impedance			350		KΩ
Differential Input Impedance			15		KΩ
Active Gain			45		dB
Common Mode Rejection Ratio			80		dB
Hysteresis	$R_{HYS} = \infty$		±1		mV

Latch Enable Characteristics

Parameter	Conditions	Min.	Typ.	Max	Units
Latch Enable Input Impedance	Each Pin		8		K Ω
Latch Enable to Output Delay, t_{PLOL} , t_{PLOH}	VOD = 200 mV		85		ps
Latch Enable Minimum Pulse Width, t_{PL}	VOD = 200 mV		20		ps
Latch Enable Input Range	VOD = 200 mV	1.6		2.4	V
Latch Setup Time, t_S	VOD = 200 mV		45		ps
Latch Hold Time, t_H			-42		ps

DC Output Characteristics, with 50 Ω to Vcco - 2 V

Parameter	Conditions	Min.	Typ.	Max	Units
Output Voltage High Level, Voh		-0.89	-0.89	-0.95	V
Output Voltage Low Level, Vol		-1.21	-1.25	-1.35	V
Output Voltage Differential Swing		320	350	400	mV

AC Performance

Parameter	Conditions	Min.	Typ.	Max	Units
Propagation Delay - t_{PD} , t_{PDL} , t_{PDH}	VOD = 500 mV	70	100	130	ps
Propagation Delay, Temperature Coefficient			0.45		ps / $^{\circ}\text{C}$
Propagation Delay Skew (Rising to Falling Transition)	VOD = 500 mV		10		ps
VOD Dispersion	50 mV < VOD < 1V		10		ps
t_{PD} vs. Common Mode Dispersion, -1.75 V < Vcm < 1.75 V	VOD = 500 mV		3		ps
Noise (RTI)			5.9		nV/ $\sqrt{\text{Hz}}$ RTI
Equivalent Input Bandwidth ^[1]		9	10	16	GHz
Deterministic Jitter (pp)	Deterministic Jitter at 10 Gbps with ± 100 mV Overdrive		2		ps
Random Jitter (rms)	Random Jitter at 10 Gbps with ± 100 mV Overdrive		0.2		ps rms
Input Signal Minimum Pulse Width			60		ps
Q / QB Rise Time	From 20% to 80%		23		ps
Q / QB Fall Time	From 20% to 80%		13		ps

Power Supply Requirements

Parameter	Conditions	Min.	Typ.	Max	Units
Input Supply Current, IccI			8		mA
Output Supply Current, Icco			45		mA
Vee Current, Iee			16		mA
Power Dissipation, Pd			120		mW
PSRR, Vcci			38		dB
PSRR, Vee			38		dB

Note 1: Equivalent Input Bandwidth is calculated with the following formula: $B_{weq} = 0.22 / (TRCOMP^2 \cdot TRIN^2)$ where TRIN is the 20%/80% transition time of a quasi-Gaussian signal applied to the comparator input, and TRCOMP is the effective transition time digitized by the comparator.

Timing Diagram

Timing Descriptions

Symbol	Timing	Description
t_{PDH}	Input to output high delay	Propagation delay measured from the time the input signal crosses the reference (\pm the input offset voltage) to the 50% point of an output low-to-high transition.
t_{PDL}	Input to output low delay	Propagation delay measured from the time the input signal crosses the reference (\pm the input offset voltage) to the 50% point of an output high-to-low transition.
t_{PLOH}	Latch enable to output high delay	Propagation delay measured from the 50% point of the latch enable signal high-to-low transition to the 50% point of an output low-to-high transition.
t_{PLOL}	Latch enable to output low delay	Propagation delay measured from the 50% point of the latch enable signal high-to-low transition to the 50% point of an output high-to-low transition.
t_H	Minimum hold time	Minimum time after the positive transition of the latch enable signal that the input signal must remain unchanged to be acquired and held at the outputs.
t_{PL}	Minimum latch enable pulse width	Minimum time that the latch enable signal must be low to acquire an input signal change.
t_S	Minimum setup time	Minimum time before the positive transition of the latch enable signal that an input signal change must be present to be acquired and held at the outputs.
t_R	Output rise time	Amount of time required to transition from a low to a high output as measured at the 20% and 80% points.
t_F	Output fall time	Amount of time required to transition from a high to a low output as measured at the 20% and 80% points.
V_{OD}	Voltage overdrive	Difference between the input voltages V_{INP} and V_{INN} .

**10 GHz LATCHED COMPARATOR
WITH RSECL OUTPUT STAGE****1****Operational Description**

The HMC676LP3E is a Latched Comparator with 10 GHz equivalent input bandwidth. The device is comprised of three blocks: 1) An input amplifier, 2) A latch, and 3) An RSECL Output Buffer. The latching circuit is level sensitive, and consists of a single high-speed latch. The HMC676LP3E comparator supports 10 Gb/s operation. The minimum input data latching pulse width is 60 ps.

The HMC676LP3E operates in either Track (Transparent) Mode, where the output follows the logical value of the input, or the Latch (Hold) Mode, where the output value is held to the logical value of the comparison result of the input just prior to (LE - LE_bar) going HI. Track Mode operation is selected by either 1) (LE - LE_bar) LO, or 2) LE and LE_bar inputs floating. Latch Mode is selected by (LE - LE_bar) HI. The input impedance of the LE and LE_bar inputs is 8 k ohms, but these inputs can be terminated with 50 ohm external resistors if desired.

When DC coupled, the clock inputs operate at an input common mode voltage of 2 V. In this case, any termination resistors would ideally be returned to 2 V. If the clock is AC coupled to the device, the input termination resistors can be returned to ground.

Pin Descriptions

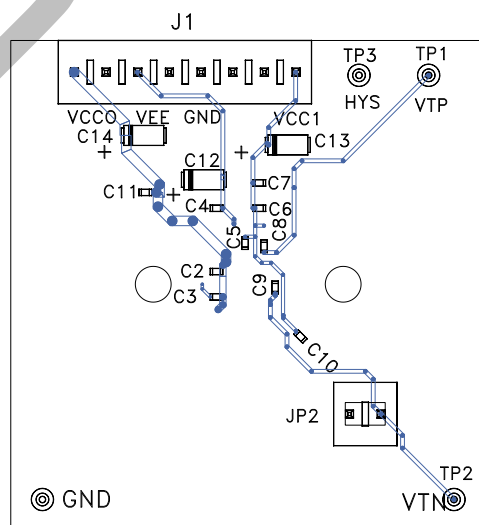

Pin Number	Function	Description	Interface Schematic
1	VTP	Termination resistor return pin for Vp Input.	
2	INP	Non-Inverting analog input	
3	INN	Inverting analog input	
4	VTN	Termination resistor return pin for Vn input	
5, 16	Vcci	Positive supply voltage input stage.	
6	\overline{LE}	Latch enable bar input pin, inverting side. Refer to the Operational Description for more details.	
7	LE	Latch enable input pin, non-inverting side. Refer to the Operational Description for more details.	
8	N/C	Pin is not connected inside the package. Connect package pin to GND for improved noise.	
9, 12	Vcco	Positive supply voltage for the output stage.	
10	\overline{Q}	Inverting output. Q bar is at logic low if the analog voltage at the non-inverting input, INP, is greater than the analog voltage at the inverting input, INN, provided that the comparator is in compare mode. Refer to the Operational Description for more details.	
11	Q	Non-inverting output. Q is at logic high if the analog voltage at the non-inverting input, INP, is greater than the analog voltage at the inverting input, INN, provided that the comparator is in compare mode. Refer to the Operational Description for more details.	
14	HYS	Hysteresis Control pin. This pin should be left disconnected for zero hysteresis. Connect to Vee with a resistor to add the desired amount of hysteresis. Refer to hysteresis graph to determine the correct sizing of Rhys hysteresis control resistor.	
13	Vee	Negative power supply, -3 V.	
15	RTN	Return for ESD protection.	
	Package Base	Exposed paddle must be connected to Vee.

[2] Circuit Board Material: Rogers 4350 or Arlon 25FR

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes in order to provide good RF grounding to 25 GHz. The evaluation circuit board shown is available from Hitite upon request.
