

**54 dB, LOGARITHMIC  
DETECTOR / CONTROLLER, 50 - 8000 MHz**

**Typical Applications**

The HMC713LP3E is ideal for:

- Cellular Infrastructure
- WiMAX, WiBro & LTE/4G
- Power Monitoring & Control Circuitry
- Receiver Signal Strength Indication (RSSI)
- Automatic Gain & Power Control
- Military, ECM & Radar

**Features**

- Wide Dynamic Range: up to 54 dB
- High Accuracy:  
±1 dB with 54 dB Range Up To 2.7 GHz
- Fast Output Response Time
- Supply Voltage: +2.7 to +5.5V
- Power-Down Mode
- Excellent Stability over Temperature
- 16 Lead 3x3 mm SMT Package: 9mm<sup>2</sup>

**Functional Diagram**

**General Description**

The HMC713LP3E Logarithmic Detector/Controller is ideal for converting the power of RF signals with frequencies in the 50 MHz to 8000 MHz range, to a DC voltage, proportional to input power, at its output. The HMC713LP3E employs a successive compression technology which delivers 54 dB of dynamic range with high measurement accuracy over a wide input frequency range. As the input signal is increased, successive amplifiers move into saturation one by one creating an accurate approximation of the logarithm function. The outputs of a series of detectors are summed, converted into voltage domain and buffered to drive the OUTP output.

For detection mode, the OUTP pin is connected to the VSET input and will provide a nominal logarithmic slope of 17 mV/dB and an intercept of -68 dBm. The HMC713LP3E can also be used in the controller mode where an external voltage is applied to the VSET pin to create an AGC or APC feedback loop.

### Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1, 4	N/C	These pins are not connected internally.	
2, 5, 9 - 12	GND	These pins and package bottom must be connected to RF/DC ground.	
3	RFIN	RF input pin.	
6	EN	Enable pin. Apply $V_{EN} > 0.8 \times V_{CC}$ for normal operation. Apply $V_{EN} < 0.2 \times V_{CC}$ to disable the HMC713LP3E and reduce supply current to 0.4mA.	
7	VSET	Set point input for controller mode. Connect to OUTP with the resistor network shown in evaluation board drawing for detector mode.	
8	CLPF	Connection for ground referenced external lowpass filter capacitor.

**Pin Descriptions (Continued)**

Pin Number	Function	Description	Interface Schematic
13	OUTP	Logarithmic output that converts the input power to a DC level in controller mode. Output voltage increases with increasing amplitude	
14	OUTN	Inverted logarithmic output. $OUTN = 2.55 - 2 \times OUTP$	
15, 16	Vcc	Bias Supply. Connect supply voltage to these pins with appropriate filtering.	

**Application & Evaluation PCB Schematic**

**Notes**

- Note 1: The HMC713LP3E evaluation board is pre-assembled for single-ended input, and detector/RSSI mode.
- Note 2: For detector mode, connect high impedance volt meter to the OUTP / OUTN port.
- Note 3: For controller mode, remove R9 & C3 and install 1k  $\Omega$  resistor (R7, not included) and 100pF capacitor (C2, not included), then make appropriate connection to OUTP and VSET. In controller mode, the OUTP / OUTN output can be used to drive a variable gain amplifier, or a variable attenuator, either directly or through a buffer or microcontroller. VSET should be connected to an external supply, typically between +0.2 and +1.2V.
- Note 4: An external capacitance C1 can be connected to CLPF port for additional filtering of OUTP and OUTN outputs..

[2] Circuit Board Material: Arlon 25FR or Rogers 4350

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
