

FEATURES

Low noise figure: 1.1 dB typical

High gain: 19.5 dB typical

High output third-order intercept (IP3): 33 dBm typical

6-lead, 2 mm × 2 mm LFCSP package

APPLICATIONS

Software defined radios

Electronics warfare

Radar applications

GENERAL DESCRIPTION

The **HMC8410** is a gallium arsenide (GaAs), monolithic microwave integrated circuit (MMIC), pseudomorphic high electron mobility transistor (pHEMT), low noise wideband amplifier that operates from 0.01 GHz to 10 GHz. The **HMC8410** provides a typical gain of 19.5 dB, a 1.1 dB typical noise figure, and a typical output IP3 of 33 dBm, requiring only 65 mA from a 5 V supply voltage. The saturated output power (P_{SAT}) of up to 22.5 dBm enables the low noise amplifier (LNA) to function as a local oscillator (LO) driver for many of Analog Devices, Inc., balanced, I/Q or image rejection mixers.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

14657-001

The **HMC8410** also features inputs/outputs (I/Os) that are internally matched to 50 Ω , making it ideal for surface-mounted technology (SMT)-based, high capacity microwave radio applications.

The **HMC8410** is housed in a RoHS-compliant, 2 mm × 2 mm, LFCSP package.

Multifunction pin names may be referenced by their relevant function only.

ELECTRICAL SPECIFICATIONS

0.01 GHz TO 3 GHz FREQUENCY RANGE

$T_A = 25^\circ\text{C}$, $V_{DD} = 5\text{ V}$, and $I_{DQ} = 65\text{ mA}$, unless otherwise noted.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
FREQUENCY RANGE		0.01		3	GHz	
GAIN		17.5	19.5		dB	
Gain Variation Over Temperature			0.01		dB/ $^\circ\text{C}$	
NOISE FIGURE			1.1	1.6	dB	0.3 GHz to 3 GHz
RETURN LOSS						
Input			15		dB	
Output			24		dB	
OUTPUT						
Output Power for 1 dB Compression	P1dB	19.0	21.0		dBm	
Saturated Output Power	P_{SAT}		22.5		dBm	
Output Third-Order Intercept	IP3		33		dBm	
SUPPLY CURRENT	I_{DQ}		65	80	mA	Adjust V_{GG1} to achieve $I_{DQ} = 65\text{ mA}$ typical
SUPPLY VOLTAGE	V_{DD}	2	5	6	V	

3 GHz TO 8 GHz FREQUENCY RANGE

$T_A = 25^\circ\text{C}$, $V_{DD} = 5\text{ V}$, and $I_{DQ} = 65\text{ mA}$, unless otherwise noted.

Table 2.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
FREQUENCY RANGE		3		8	GHz	
GAIN		15.5	18		dB	
Gain Variation Over Temperature			0.01		dB/ $^\circ\text{C}$	
NOISE FIGURE			1.4	1.9	dB	
RETURN LOSS						
Input			12		dB	
Output			12		dB	
OUTPUT						
Output Power for 1 dB Compression	P1dB	18.0	21.0		dBm	
Saturated Output Power	P_{SAT}		22.5		dBm	
Output Third-Order Intercept	IP3		31.5		dBm	
SUPPLY CURRENT	I_{DQ}		65	80	mA	Adjust V_{GG1} to achieve $I_{DQ} = 65\text{ mA}$ typical
SUPPLY VOLTAGE	V_{DD}	2	5	6	V	

8 GHz TO 10 GHz FREQUENCY RANGE

$T_A = 25^\circ\text{C}$, $V_{DD} = 5\text{ V}$, and $I_{DQ} = 65\text{ mA}$, unless otherwise noted.

Table 3.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
FREQUENCY RANGE		8		10	GHz	
GAIN		13	16		dB	
Gain Variation Over Temperature			0.01		dB/ $^\circ\text{C}$	
NOISE FIGURE			1.7	2.2	dB

ABSOLUTE MAXIMUM RATINGS

Table 4.

Parameter ¹	Rating
Drain Bias Voltage (V_{DD})	7 V dc
Radio Frequency (RF) Input Power (RFIN)	20 dBm
Continuous Power Dissipation (P_{DISS}), $T = 85^{\circ}\text{C}$ (Derate 14.8 mW/ $^{\circ}\text{C}$ above 85°C)	1.3 W
Channel Temperature	175°C
Storage Temperature Range	-65°C to $+150^{\circ}\text{C}$
Operating Temperature Range	-40°C to $+85^{\circ}\text{C}$
Thermal Resistance (Channel to Ground Paddle)	67.73°C/W
Maximum Peak Reflow Temperature (MSL3) ²	260°C
ESD Sensitivity	
Human Body Model (HBM)	Class1B Passed 500 V

¹ When referring to a single function of a multifunction pin in the parameters, only the portion of the pin name that is relevant to the specification is listed. For the full pin names of multifunction pins, refer to the Pin Configuration and Function Descriptions section.

² See the Ordering Guide section for more information.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device.

Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	GND	Ground. This pin must be connected to the RF/dc ground. See Figure 3 for the interface schematic.
2	RFIN/V _{GG1}	RF Input (RFIN). This pin is ac-coupled and matched to 50 Ω. See Figure 4 for the interface schematic. Gate Bias of the Amplifier (V _{GG1}). This pin is ac-coupled and matched to 50 Ω. See Figure 4 for the interface schematic.
3, 4, 6	NIC	Not Internally Connected. This pin must be connected to the RF/dc ground.
5	RFOUT/V _{DD}	RF Output (RFOUT). This pin is ac-coupled and matched to 50 Ω. See Figure 5 for the interface schematic. Drain Bias for Amplifier (V _{DD}). This pin is ac-coupled and matched to 50 Ω. See Figure 5 for the interface schematic.
	EPAD	Exposed Pad. The exposed pad must be connected to RF/dc ground.

THEORY OF OPERATION

The [HMC8410](#) is a gallium arsenide (GaAs), monolithic microwave integrated circuit (MMIC), pseudomorphic (pHEMT), low noise wideband amplifier.

The cascode amplifier uses a fundamental cell of two field effect transistors (FETs) in series, source to drain. The basic schematic for the cascode cell is shown in Figure 37, which forms a low noise amplifier operating from 0.01 GHz to 10 GHz with excellent noise figure performance.

Figure 37. Basic Schematic for the Cascode Cell

The [HMC8410](#) has single-ended input and output ports whose impedances are nominally equal to $50\ \Omega$ over the 0.01 GHz to 10 GHz frequency range. Consequently, it can directly insert into a $50\ \Omega$ system with no required impedance matching circuitry, which also means that multiple [HMC8410](#) amplifiers can be cascaded back to back without the need for external matching circuitry.

The input and output impedances are sufficiently stable vs. variations in temperature and supply voltage that no impedance matching compensation is required.

Note that it is critical to supply very low inductance ground connections to the ground pins as well as to the backside exposed paddle to ensure stable operation.

To achieve optimal performance from the [HMC8410](#) and prevent damage to the device, do not exceed the absolute maximum ratings.

APPLICATIONS INFORMATION

Figure 38 shows the basic connections for operating the HMC8410. AC couple the input and output of the HMC8410 with appropriately sized capacitors. DC block capacitors and RF choke inductors are supplied on the RFIN and RFOUT pins of the HMC8410 evaluation board. See Table 6 for additional information. These dc block capacitors and RF choke inductors form wideband bias tees on the input and output ports to provide both ac coupling and the necessary supply voltages to the RFIN and RFOUT pins. A 5 V dc bias is supplied to the amplifier through the choke inductor connected to the RFOUT pin, and the negative V_{GG1} voltage is supplied to the RFIN pin through the choke inductor.

RECOMMENDED BIAS SEQUENCING

To not damage the amplifier, follow the recommended bias sequencing.

During Power-Up

The recommended bias sequence during power-up for the HMC8410 follows:

1. Connect to GND.
2. Set V_{GG1} to -2 V.
3. Set V_{DD} to $+5$ V.
4. Increase V_{GG1} to achieve a typical supply current (I_{DQ}) = 65 mA.
5. Apply the RF signal.

During Power-Down

The recommended bias sequence during power-down for the HMC8410 follows:

1. Turn off the RF signal.
2. Decrease V_{GG1} to -2 V to achieve a typical $I_{DQ} = 0$ mA.
3. Decrease V_{DD} to 0 V.
4. Increase V_{GG1} to 0 V.

The bias conditions previously listed ($V_{DD} = 5$ V and $I_{DQ} = 65$ mA) are the recommended operating points to achieve optimum performance. The data used in this data sheet was taken with the recommended bias conditions. When using the HMC8410 with different bias conditions, different performance than what is shown in the Typical Performance Characteristics section may result.

Figure 18, Figure 30, and Figure 31 show that increasing the voltage from 2 V to 7 V typically increases P_{1dB} and P_{SAT} at the expense of power consumption with minor degradation on noise figure (NF).

TYPICAL APPLICATION CIRCUIT

Figure 38. Typical Application Circuit

EVALUATION BOARD

The [HMC8410](#) evaluation board is a 4-layer board fabricated using a Rogers 4350 and the best practices for high frequency RF design. The RF input and RF output traces have a $50\ \Omega$ characteristic impedance.

The [HMC8410](#) evaluation board and populated components operate over the -40°C to $+85^{\circ}\text{C}$ ambient temperature range. For proper bias sequence, see the Applications Information section.

The [HMC8410](#) evaluation board schematic is shown in Figure 40. A fully populated and tested evaluation printed circuit board (PCB) is available from Analog Devices, Inc., upon request (see Figure 39).
