

## Evaluating the AD1937/AD1939 Four ADC/Eight DAC with PLL 192 kHz, 24-Bit Codec

### EVAL-AD1937AZ/EVAL-AD1939AZ PACKAGE CONTENTS

AD1937/AD1939 evaluation board

USBi control interface board

USB cable

### OTHER SUPPORTING DOCUMENTATION

[AD1937 data sheet](#)

[AD1939 data sheet](#)

### EVALUATION BOARD OVERVIEW

This document explains the design and setup of the evaluation board for the AD1937 and AD1939. The evaluation board must be connected to an external  $\pm 12$  V dc power supply and ground. On-board regulators derive 5 V and 3.3 V supplies for the AD1937/AD1939. The AD1937/AD1939 can be controlled

through an SPI or I<sup>2</sup>C interface. A small external interface board, EVAL-ADUSB2EBZ (also called USBi), connects to a PC USB port and provides I<sup>2</sup>C and SPI access to the evaluation board through a ribbon cable. A graphical user interface (GUI) program is provided for easy programming of the chip in a Microsoft® Windows® PC environment. The evaluation board allows demonstration and performance testing of most AD1937/AD1939 features, including four ADCs and eight DACs, as well as the digital audio ports.

Additional analog circuitry (ADC input filters, DAC output filter/buffer) and digital interfaces such as S/PDIF are provided to ease product evaluation.

All analog audio interfaces are accessible with stereo audio, 3.5 mm TRS connectors.

REVISION HISTORY

2/10—Revision 0: Initial Version

## SETTING UP THE EVALUATION BOARD

### STANDALONE MODE

It is possible to run the board and the AD1937/AD1939 codec in standalone mode, which fixes the functionality of the AD1937/AD1939 into the I<sup>2</sup>S data format, running at  $256 \times f_s$  (default register condition). The ADC BCLK and LRCLK ports are flipped between slave and master (input and output) by tying SDA/COUT (Pin 31) to low or high. This is accomplished by moving the J5 jumper to either 0 or SDA/1 (see Figure 2 and Figure 3).

Figure 2. Standalone Slave Mode

Figure 3. Standalone Master Mode

With the control jumpers set to standalone slave mode, all of S2 and S3 set to off, and both mode switches (S4 and S5) set to 0. The S/PDIF receiver is the LRCLK, BCLK, and SDATA source. The default MCLK jumper setting routes MCLK from the S/PDIF receiver to the AD1937/AD1939. With a valid S/PDIF data stream connected to a selected S/PDIF input port, the board passes audio from the S/PDIF port to all four stereo outputs and from Stereo IN1 to the S/PDIF output ports. IN2 can be selected by changing S3, Position 8, to on. Other serial audio clock and data routing configurations are described in the Switch and Jumper Settings section.

### SPI AND I<sup>2</sup>C CONTROL

The evaluation board can be configured for interactive control of the registers in the AD1937/AD1939 by connecting the SPI or I<sup>2</sup>C port to the USBi. SPI and I<sup>2</sup>C jumper settings are shown in Figure 4 and Figure 5. All part variations are SPI (for the AD1939). Note that the **Automated Register Window Builder** software controls the AD1937 (I<sup>2</sup>C) only when the ADDR jumpers are set to 00 and the correct .xml file is loaded.

Figure 4. SPI Control

Figure 5. I<sup>2</sup>C Control

The **Automated Register Window Builder** controls the AD1937/AD1939 and is available at [www.analog.com/AD1937](http://www.analog.com/AD1937) or [www.analog.com/AD1939](http://www.analog.com/AD1939).

### AUTOMATED REGISTER WINDOW BUILDER SOFTWARE INSTALLATION

The **Automated Register Window Builder** is a program that launches a graphical user interface for direct, live control of the AD1937/AD1939 registers. The GUI content for a part is defined in a part-specific .xml file; these files are included in the software installation. To install the **Automated Register Window Builder** software, follow these steps:

1. At [www.analog.com/AD1937](http://www.analog.com/AD1937) or [www.analog.com/AD1939](http://www.analog.com/AD1939), find the **Resources & Tools** list.
2. In the list, find **Evaluation Boards & Development Kits** and click **Evaluation Boards/Tools** to open the provided **ARWBvXX.zip** file.
3. Double-click the provided .msi file to extract the files to an empty folder on your PC.
4. Then double-click **setup.exe** and follow the prompts to install the **Automated Register Window Builder**. A computer restart is not required.
5. Copy the .xml file for the AD1937/AD1939 from the extraction folder into the **C:\Program Files\Analog Devices Inc\AutomatedRegWin** folder, if it does not appear in the folder after installation.

### HARDWARE SETUP—USBi

To set up the USBi hardware, follow these steps:

1. Plug the USBi ribbon cable into the J1 header.
2. Connect the USB cable to your computer and to the USBi.
3. When prompted for drivers, follow these steps:
  - a. Choose **Install from a list or a specific location**.
  - b. Choose **Search for the best driver in these locations**.
  - c. Check the box **Include this location in the search**.
  - d. Find the USBi driver in **C:\Program Files\Analog Devices Inc\AutomatedRegWin\USB drivers**.
  - e. Click **Next**.
  - f. If prompted to choose a driver, select **CyUSB.sys**.
  - g. If the PC is running Windows XP and you receive a message that the software has not passed Windows logo testing, click **Continue Anyway**.

You can now open the **Automated Register Window Builder** application and load the file for the part onto your evaluation board.

## POWERING THE BOARD

The AD1937/AD1939 evaluation board requires power supply input of  $\pm 12$  V dc and ground to the three binding posts; +12 V draws ~250 mA, and -12 V draws ~100 mA. The on-board regulators provide two 3.3 V rails and one 5.0 V rail. The 3.3 V rails supply AVDD and DVDD for the AD1937/AD1939; DVDD also supplies power for the peripheral active components on the board. The 5.0 V rail provides voltage only to the AD1937/AD1939 internal regulator, which consists of a PNP pass transistor and a few passive components. The PNP is driven into 3.3 V regulation by the VDRIVE pin of the AD1937/AD1939, with the VSUPPLY and VSENSE pins acting as power and feedback for the regulator. An appropriate sized PNP can supply 3.3 V to the AVDD and DVDD pins of the AD1937/AD1939. The jumper blocks are shown in Figure 6 and Figure 7.

Figure 6. AD1939 Main Regulators Active

Figure 7. AD1939 Internal Regulator Active

The first step in using the AD1937/AD1939 internal regulator is to provide power to the regulator circuit by moving the AD1937/AD1939 REG jumper from DISABLE to ENABLE, as shown in Figure 7. Three discrete jumpers allow the AD1937/AD1939 to be run from either the main AVDD and DVDD regulators or the AD1937/AD1939 internal regulator. These jumpers also allow measurement of current drawn by the individual sections of the AD1937/AD1939. The only components on the AD1937/AD1939 side of the jumper are the AD1937/AD1939 and the supply decoupling capacitors.

## SETTING UP THE MASTER CLOCK (MCLK)

The AD1937/AD1939 evaluation board has a series of jumpers that give the user great flexibility in the MCLK clock source of the AD1937/AD1939. MCLK can come from six different sources: passive crystal, active oscillator, external clock in, S/PDIF receiver, and two header connections. Note that the complex programmable logic device (CPLD) on the board must have a valid clock source; the frequency is not critical. These jumper blocks can assign a clock to the CPLD as well. Most applications of the board use MCLK from either the S/PDIF receiver or one of the header (HDR) inputs. Figure 8 to Figure 10 show the on-board active oscillator disabled so that it does not interfere with the selected clock. The clock feed to the CPLD comes directly from the clock source.

Note that, if the HDR connectors are to be driven with MCLK from a source on the evaluation board, SW2 and/or SW3 must be switched from the IN position to the OUT position.

Figure 8. S/PDIF Receiver as MCLK Master; the AD1939 and CPLD as Slaves

Figure 9. HDR1 as MCLK Master; the AD1939, CPLD, and HDR2 as Slaves

## CONFIGURING THE PLL FILTER

The PLL for the AD1937/AD1939 can run from either MCLK or LRCLK, according to its setting in the PLL and Clock Control 0 register, Bits[6:5]. The matching RC loop filter must be connected to LF (Pin 61) using JP15. See Figure 14 and Figure 15 for the jumper positions.

Figure 14. MCLK Loop Filter Selected

Figure 15. LRCLK Loop Filter Selected

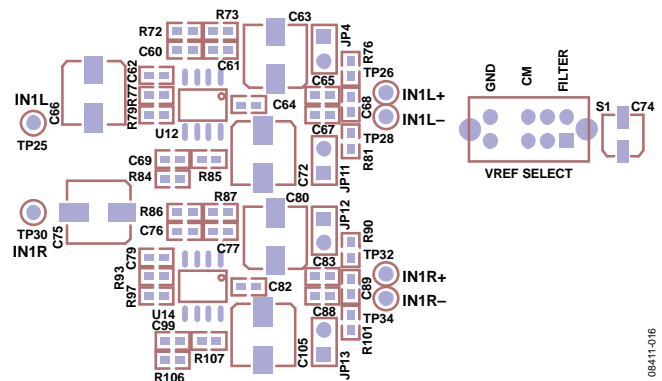

Normally, the MCLK filter is the default selection; it is also possible to use the register control window to program the PLL to run from the LRCLK. In this case, the jumper must be changed as shown in Figure 15.

## CONNECTING AUDIO CABLES

### Analog Audio

The analog inputs and outputs use 3.5 mm TRS jacks; they are configured in the standard configuration: tip = left, ring = right, sleeve = ground. The analog inputs to IN1 and IN2 generate 0 dBFS from a 1 V rms analog signal. The on-board buffer circuit creates the differential signal to drive the ADC with 2 V rms at the maximum level. The DAC puts out a 1.8 V rms differential signal; this signal becomes single-ended for the OUT connectors. There are test points that allow direct access to the ADC and DAC pins; note that the ADC and DAC have a common-mode voltage of 1.5 V dc. These test points require proper care so that improper loading does not drag down the common-mode voltage, and the headroom and performance of the part do not suffer.

The ADC buffer circuit is designed with a switch (S1) that allows the user to change the voltage reference for all of the amplifiers. GND, CM, and FILTR can be selected as a reference; it is advisable to shut down the power to the board before changing this switch. The CM and FILTR lines are very sensitive and do not react well to a change in load while the AD1937/AD1939 is active. A series of jumpers allows the user to dc-couple the buffer circuit to the ADC analog port when CM and FILTR are selected (see Figure 16).

For the full flexibility of the AD1937/AD1939, the part can be put in SPI/I<sup>2</sup>C control mode and programmed with the **Automated Register Window Builder** application (see Figure 4 and Figure 5 for the appropriate jumper settings). Changing the registers and setting the DIP switches allow many possible configurations. In the various master and slave modes, the AD1937/AD1939 take MCLK from a selected source and can be set to generate or receive either BCLK or LRCLK to or from either the ADC or the DAC port, depending on the settings and requirements.

As an example, to set the ADC port as master, switch the ADC Control 2 register bits for BCLK and LRCLK to master, and change SW2, Position 2 and Position 5, to on. In this mode, the board is configured so that the ADC BCLK and LRCLK pins are the clock source for both the ADC destination and the DAC data source. For the DAC port to be the master, the DAC Control 1 register bits for BCLK and LRCLK must be changed to master, and SW2, Position 2 and Position 3, and SW2, Position 5 and Position 6, must all be on. On this evaluation board, these settings allow the master port on the AD1937/AD1939 to drive both the S/PDIF and the HDR connections. Many combinations of master and slave are possible (see Figure 17 and Figure 18 for the correct settings).

#### **S/PDIF Audio**

The settings in Figure 17 and Figure 18 show the details of clock routing and control for both the ADC and DAC ports. The board is shipped with the S/PDIF port selected as the default; the hex switches are set to 0, and all DIP switches are set to off. The AD1937/AD1939 are shipped in standalone slave mode (see Figure 2); the BCLK and LRCLK signals run from the S/PDIF receiver to both ADC and DAC ports of the AD1937/AD1939.

In this default configuration, the DAC audio path routes the S/PDIF audio signal to all four stereo AD1937/AD1939 DSDATA inputs simultaneously. The rotary switch, S4, allows the user to select individual stereo pairs for transmission of the analog signal. Position 0 is the default; Position 1 to Position 4 allow the S/PDIF input signal to be assigned to Pair 1 to Pair 4, respectively.

Also in this default configuration, IN1 analog is routed through the AD1937/AD1939 ADC ASDATA1 path to the S/PDIF output. IN2 is selected by changing the S3 DIP switch, Position 8, from 0 to 1.

#### **HDR Connectors—Serial Audio**

Routing of serial audio to and from the HDR1 connector is controlled by DIP SW3, Position 6 and Position 7, and Rotary S4. For the DAC audio signal path, S4, Position 8, assigns the data signal coming into HDR1 DSDATA1 to all four DSDATA ports on the AD1937/AD1939. S4, Position 9, assigns the HDR1 labeled ports to the associated port on the AD1937/AD1939.

#### **Other Options**

It is possible to mute all data going to the DSDATA ports of the AD1937/AD1939 by selecting S4, Position 7. This shows the SNR of the DACs.

To use other  $f_s$  rates, the USBi must be connected and the AD1937/AD1939 registers must be programmed accordingly. For example, adjusting the  $f_s$  rate to 96 kHz requires that the ADC and DAC Control 0 registers have sample rates set to 96 kHz (see Figure 17 and Figure 18 for the complete list of options).

The CPLD code is presented in the CPLD Code section and is included with the evaluation board; alterations and additions to the functionality of the CPLD are possible by altering the code and reprogramming the CPLD.

# ROTARY AND DIP SWITCH SETTINGS

09411-017

AD193X/ADAU132X Rev-E Evaluation Board Configuration: (\* indicates default setting)

- 1) DIP Switch S2 Position-8 (SPDIF\_RX\_TX reset) must be toggled after power-up for proper operation of the SPDIF receiver and transmitter.
- 2) The AD193x evaluation board defaults the AD193x codec to standalone mode preventing SPI/I<sup>2</sup>C operation. The J5, J6, J7, and J8 header jumpers can be changed for SPI/I<sup>2</sup>C operation.

## ADC and DAC Serial Clock (BCLK, LRCLK) Source Selection and Routing (Switch S2)

- 1) DIP Switch S2 controls the AD193x ADC and DAC serial clock source selection. One of four clock sources is selected based on the setting. SPDIF Receiver CS8416, Header Connector HDR1, ADC serial clocks, or DAC serial clock can be the clock source. ADC and DAC serial clock selection is controlled independently.
- 2) The AD193x master clock source should be selected using the JP28, JP29, JP30, and JP31 header jumpers such that the MCLK source is in sync with the DAC/ADC serial clock and data source.

1 = the V pin input determines the state of the validity bit in the outgoing AES3 transmitted data		0	1	1	SPDIF_TX MCLK Rate = 128x/s

(Note: This position must be toggled after power-up for proper operation.)

Figure 17. Settings Chart 1

## DAC and ADC Serial Data (DSDATA/ASDATA) Source Selection and Routing (Switch S4 and Switch S3)

Rotary hex Switch S4 selects the AD193x DAC serial data source. The DAC data source can be either SPDIF Receiver CS8416 or can be provided by the Header Connector HDR1. It is important to note that the DAC data source should be in sync with the DAC serial port clock source (set by DIP Switch S2, Positions {5:6}). DIP Switch S3 routes the ADC serial data among AD193x, SPDIF Transmitter CS8406, and Header Connector HDR1 in stereo, TDM, and aux mode.

4	C78, C137, C171, C195	Multilayer ceramic capacitor, 100 V, NP0 (0603)	Panasonic EC	ECJ-1VC2A680J
1	R2	Chip resistor, 715 $\Omega$ , 1%, 100 mW, thick film (0603)	Rohm	MCR03EZPFX7150
1	U11	IC inverter hex, TTL/LSTTL, 14 SOIC	NXP Semi	74HC04D-T
2	U19, U26	IC buffer, quad three-state, 14 SOIC	Texas Instruments	SN74LV125AD
1	R29	Chip resistor, 75 $\Omega$ , 1%, 100 mW, thick film	Panasonic EC	ERJ-3EKF75R0V

Qty	Designator	Description	Manufacturer	Part Number
1	R67	(0603) Chip resistor, 90.9 $\Omega$ , 1%, 100 mW, thick film (0603)	Rohm	MCR03EZPFX90R9
16	C22, C27, C32, C35, C41, C47, C54, C57, C165, C173, C182, C186, C187, C192, C199, C202	Multilayer ceramic capacitor, 50 V, NP0 (0603)	Murata ENA	GRM1885C1H911JA01D
1	Y1	Crystal, 12.288 MHz, SMT, 10 pF	Abracon Corp	ABM3B-12.288MHZ-10-1-U-T
1	U15	Four ADC/eight DAC with PLL, 192 kHz	Analog Devices	AD1939YSTZ
1	U23	Microprocessor voltage supervisor	Analog Devices	ADM811RARTZ
1	U1	Voltage regulator, low dropout	Analog Devices	ADP3303ARZ-3.3
1	J2	5-way binding post, black, uninsulated base TH	Deltron Components	552-0100 BLK
1	J3	5-way binding post, mini, green, uninsulated base TH	Deltron Components	552-0400 GRN
1	J4	5-way binding post, mini, red, uninsulated base TH	Deltron Components	552-0500 RED
2	J22, J23	SMA receptacle straight PCB mount	Amp-RF Division	901-144-8RFX
1	U8	192 kHz digital audio receiver, 28-TSSOP	Cirrus Logic	CS8416-CZZ
1	U13	192 kHz digital audio, S/PDIF transmitter	Cirrus Logic	CS8406-CZZ
2	D2, D5	Passivated rectifier, 1 A 50 V MELF	Micro Commercial	DL4001-TP
1	S1	Switch slide, DP3T, PC MNT, L = 4 mm	E-Switch	EG2305
1	SW1	DPDT slide switch, vertical	E-Switch	EG2207
6	L2 to L7	Chip ferrite bead, 600 $\Omega$ at 100 MHz	TDK	MPZ1608S601A
1	L1	Chip ferrite bead, 600 $\Omega$ at 100 MHz	Steward	HZ0805E601R-10
2	J1, J14	10-way shrouded polarized header	3M	N2510-6002RB
4	J15 to J18	16-way unshrouded, not populated	3M	N/A
1	J19	Connector header, 0.100 dual STR, 72 POS	Sullins	PBC10DAAN; or cut PBC36DAAN
2	J20, J26	Connector header, 0.100 dual STR, 72 POS	Sullins	PBC13DAAN; or cut PBC36DAAN
4	J5 to J8	Connector header, 0.100 dual STR, 72 POS	Sullins	PBC06DAAN; or cut PBC36DAAN
2	S4, S5	16-position rotary switch hex	APEM	PT65503
16	JP4, JP11 to JP14, JP17, JP18, JP20 to JP22, JP24, JP26, JP28 to JP31	2-pin header, unshrouded jumper, 0.10"; use shunt Tyco 881545-2	Sullins	PBC02SAAN; or cut PBC36SAAN
15	JP1 to JP3, JP5 to JP10, JP15, JP16, JP19, JP23, JP25, JP27	3-position SIP header	Sullins	PBC03SAAN; or cut PBC36SAAN
1	U16	Complex programmable logic device (CPLD), HI PERF E2CMOS PLD	Lattice Semiconductor	LC4128V-75TN100C
2	D8, D11	Green, diffused, 10 millicandela, 565 nm (1206)	Lumex Opto	SML-LX1206GW-TR
2	D6, D9	Red, diffused, 6.0 millicandela, 635 nm (1206)	Lumex Opto	SML-LX1206IW-TR
2	D7, D10	Yellow, diffused, 4.0 millicandela, 585 nm (1206)	CML Innovative Tech	CMD15-21VYD/TR8
2	U2, U3	3-terminal adjustable voltage regulator, DPak	STMicroelectronics	LM317MDT-TR
6	J10, J11, J13, J21, J27, J28	Stereo mini jack SMT	CUI	SJ-3523-SMT
2	R161, R162	Resistor network, bussed 8 res, 9 pin	CTS	773091103
8	U6, U9, U12, U14, U17, U20, U24, U25	Dual bipolar/JFET audio op amp	Analog Devices	OP275GSZ
1	R102	Not populated	N/A	N/A
1	U21	12.288 MHz fixed SMD oscillator, 1.8 V dc to 3.3 V dc	Abracon Corp	AP35-12.288MHz-F-J-B
2	J9, J12	RCA jack PCB TH mount R/A yellow	Connect-Tech Products	CTP-021A-S-YEL

Qty	Designator	Description	Manufacturer	Part Number
1	U10	110 $\Omega$ AES/EBU transformer	Scientific Conversion	SC937-02
2	U18, U22	Buffer, three-state single gate	Texas Instruments	SN74LVC1G125DRLR
1	U4	Octal, three-state buffer/driver	Texas Instruments	SN74LVC541ADBR
2	SW2, SW3	SPDT slide switch, PC mount	E-Switch	EG1218
2	S2, S3	8-position, SPST SMD switch, flush, actuated	CTS	219-8LPST
1	S6	Tact switch, 6 mm, gull wing	Tyco/Alcoswitch	FSM6JSMA
1	U5	15 Mb/sec fiber optic receiving module with shutter	Toshiba	TORX147L(F,T)
1	U7	15 Mb/sec fiber optic transmit module,	Toshiba	TOTX147L(F,T)
69	TP1 to TP69	Mini test point, white, 0.1 inch, OD	Keystone Electronics	5002
1	Q1	100 V, medium power, low saturation transistor, SOT223, NPN	Zetex	ZX5T953GTA

## NOTES

## NOTES

I<sup>2</sup>C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).

**ESD Caution**

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

**Legal Terms and Conditions**

By using the evaluation board discussed herein (together with any tools, components documentation or support materials, the "Evaluation Board"), you are agreeing to be bound by the terms and conditions set forth below ("Agreement") unless you have purchased the Evaluation Board, in which case the Analog Devices Standard Terms and Conditions of Sale shall govern. Do not use the Evaluation Board until you have read and agreed to the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. This Agreement is made by and between you ("Customer") and Analog Devices, Inc. ("ADI"), with its principal place of business at One Technology Way, Norwood, MA 02062, USA. Subject to the terms and conditions of the Agreement, ADI hereby grants to Customer a free, limited, personal, temporary, non-exclusive, non-sublicensable, non-transferable license to use the Evaluation Board FOR EVALUATION PURPOSES ONLY. Customer understands and agrees that the Evaluation Board is provided for the sole and exclusive purpose referenced above, and agrees not to use the Evaluation Board for any other purpose. Furthermore, the license granted is expressly made subject to the following additional limitations: Customer shall not (i) rent, lease, display, sell, transfer, assign, sublicense, or distribute the Evaluation Board; and (ii) permit any Third Party to access the Evaluation Board. As used herein, the term "Third Party" includes any entity other than ADI, Customer, their employees, affiliates and in-house consultants. The Evaluation Board is NOT sold to Customer; all rights not expressly granted herein, including ownership of the Evaluation Board, are reserved by ADI. **CONFIDENTIALITY.** This Agreement and the Evaluation Board shall all be considered the confidential and proprietary information of ADI. Customer may not disclose or transfer any portion of the Evaluation Board to any other party for any reason. Upon discontinuation of use of the Evaluation Board or termination of this Agreement, Customer agrees to promptly return the Evaluation Board to ADI. **ADDITIONAL RESTRICTIONS.** Customer may not disassemble, decompile or reverse engineer chips on the Evaluation Board. Customer shall inform ADI of any occurred damages or any modifications or alterations it makes to the Evaluation Board, including but not limited to soldering or any other activity that affects the material content of the Evaluation Board. Modifications to the Evaluation Board must comply with applicable law, including but not limited to the RoHS Directive. **TERMINATION.** ADI may terminate this Agreement at any time upon giving written notice to Customer. Customer agrees to return to ADI the Evaluation Board at that time. **LIMITATION OF LIABILITY.** THE EVALUATION BOARD PROVIDED HEREUNDER IS PROVIDED "AS IS" AND ADI MAKES NO WARRANTIES OR REPRESENTATIONS OF ANY KIND WITH RESPECT TO IT. ADI SPECIFICALLY DISCLAIMS ANY REPRESENTATIONS, ENDORSEMENTS, GUARANTEES, OR WARRANTIES, EXPRESS OR IMPLIED, RELATED TO THE EVALUATION BOARD INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTY OF MERCHANTABILITY, TITLE, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS. IN NO EVENT WILL ADI AND ITS LICENSORS BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES RESULTING FROM CUSTOMER'S POSSESSION OR USE OF THE EVALUATION BOARD, INCLUDING BUT NOT LIMITED TO LOST PROFITS, DELAY COSTS, LABOR COSTS OR LOSS OF GOODWILL. ADI'S TOTAL LIABILITY FROM ANY AND ALL CAUSES SHALL BE LIMITED TO THE AMOUNT OF ONE HUNDRED US DOLLARS (\$100.00). **EXPORT.** Customer agrees that it will not directly or indirectly export the Evaluation Board to another country, and that it will comply with all applicable United States federal laws and regulations relating to exports. **GOVERNING LAW.** This Agreement shall be governed by and construed in accordance with the substantive laws of the Commonwealth of Massachusetts (excluding conflict of law rules). Any legal action regarding this Agreement will be heard in the state or federal courts having jurisdiction in Suffolk County, Massachusetts, and Customer hereby submits to the personal jurisdiction and venue of such courts. The United Nations Convention on Contracts for the International Sale of Goods shall not apply to this Agreement and is expressly disclaimed.
