

General Description

The IDT8CA3V76-0137 is a single output (155.52MHz) LVPECL VCXO. The device uses IDT's fourth generation FemtoClock® NG technology for an optimum of high clock frequency and low phase noise performance and (<0.5 ps RMS 12kHz - 20MHz). The device accepts 3.3V supply and is packaged in a small, lead-free (RoHS 6) 6-lead ceramic 5mm x 7mm x 1.55mm package.

The extended temperature range supports wireless infrastructure, telecommunication and networking end equipment requirements. The device is a member of the high-performance clock family from IDT.

Features

- Fourth generation FemtoClock® NG technology
- Output Frequency 155.52MHz
- VCXO Absolute Pull Range (APR) ± 200 ppm
- One 3.3V LVPECL clock output
- Output enable control input, LVCMOS/LVTTL compatible
- RMS phase jitter @ 155.52MHz (12kHz - 20MHz): 0.5ps (typical)
- RMS phase jitter @ 155.52MHz (1kHz - 40MHz): 0.9ps (typical)
- 3.3V supply voltage
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) 6-lead ceramic 5mm x 7mm x 1.55mm package

Pin Description and Characteristic Tables

Table 1. Pin Descriptions

Number	Name	Type		Description
1	VC	Input		VCXO Control Voltage input.
2	nOE	Input	Pulldown	Output enable pin. See Table 3 for function. LVCMOS/LVTTL interface levels.
3	V _{EE}	Power		Negative power supply.
4, 5	Q, nQ	Output		Differential clock output. LVPECL interface levels.
6	V _{CC}	Power		Power supply pin.

NOTE: *Pulldown* refers to an internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
C _{IN}	Input Capacitance	nOE			5.5		pF
		VC			10		pF
R _{PULLDOWN}	Input Pulldown Resistor				50		kΩ

Function Tables

Table 3. nOE Configuration

Input	Output Enable
nOE	
0 (default)	Q, nQ outputs are enabled
1	Q, nQ outputs are in high-impedance state

Principles of Operation

The IDT8CA3V76-0137 uses a fractional feedback-divider synthesizer core with a Delta-Sigma modulator for noise shaping and is very robust in its frequency synthesis capability. The output frequency is synthesized from an internal 114.285MHz third overtone crystal in order to minimize phase noise generation by frequency multiplication. The higher frequency reference crystal also allows more efficient “shaping” of noise by the Delta-Sigma modulator. The device contains a 25-bit PLL feedback divider with a 2-bit pre-scaler(P), a 7-bit integer portion (MINT), a 18-bit fractional portion (MFRAC) and a 7-bit output divider (N) for high-resolution frequency generation. The resolution (frequency increment for one MFRAC increment) is equal to $114.285\text{MHz} \div (2^{18} \cdot N)$ or $435.9\text{Hz} \div N$ ($N = 2$ to 126).

This device is a digital VCXO. In a traditional, “analog” VCXO,

variation of the output frequency is achieved by “pulling” the resonant frequency of the crystal. A digital VCXO operates with a fixed crystal frequency. Variation of the output frequency is achieved by modifying the fractional portion (MFRAC) of the PLL feedback loop divider. A fixed-frequency crystal features a comparatively higher Q factor than a pullable crystal, which enables better phase-noise performance.

The operating frequency and pull range of the 8CA3V76-0137 are factory-programmed by IDT to a center frequency of 155.52 MHz and a pull range of +/- 237 MHz. The data given in this datasheet are valid for this particular programming only.

More devices with different programming are available on request. Please refer to the FemtoClock NG Ceramic-Package XO and VCXO Ordering Product Information document and/or contact IDT.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{CC}	3.63V
Inputs, V_I Other Inputs	-0.5V to $V_{CC} + 0.5V$
Outputs, I_O (LVPECL) Continuous Current Surge Current	50mA 100mA
Package Thermal Impedance, θ_{JA}	41.4°C/W (0 mps)
Storage Temperature, T_{STG}	-65°C to 150°C

Applications Information

Recommendations for Unused Input Pins

Inputs:

LVC MOS Pins

All control pins have internal pulldowns; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 1A and 1B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Power Considerations

This section provides information on power dissipation and junction temperature for the IDT8CA3V76-0137. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the IDT8CA3V76-0137 is the sum of the core power plus the power dissipation in the load(s). The following is the power dissipation for $V_{CC} = 3.3V + 5\% = 3.465V$, which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipation in the load.

- Power (core)_{MAX} = $V_{CC_MAX} * I_{EE_MAX} = 3.465V * 480mA = \mathbf{512.82mW}$
- Power (outputs)_{MAX} = **32mW/Loaded Output pair**

Total Power_{MAX} (3.465V, with all outputs switching) = 512.82mW + 32mW = **544.82mW**

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, T_j , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_{total} + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_{total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 41.4°C/W per Table 7 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.545\text{W} * 41.4^\circ\text{C/W} = 107.56^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 6. Thermal Resistance θ_{JA} for a 6-lead Ceramic 5mm x 7mm Package

θ_{JA} vs. Air Flow	
Meters per Second	0
Multi-Layer PCB, JEDEC Standard Test Boards	41.4°C/W

NOTE: For proper thermo dissipation, the PCB layout for the pin pad should be at minimum equal the package pin dimensions. The solder reflow specification should be that the entire pad is covered.
