

ISL21080XXEV1Z Evaluation Boards User Guide

Introduction

The ISL21080XXEV1Z evaluation board is designed to measure the performance of the nano power [ISL21080](#) voltage reference. The reference comes in a wide selection of output voltages ranging from 0.9V to 5.0V, and an initial accuracy as low as 0.2% (3.0V to 5.0V options). With a typical supply current of 500nA or less, the ISL21080 is ideal for extending battery life while reducing cost for general purpose portable applications.

The evaluation board includes voltage input test points (V_{IN} and GND) for a power supply input, as well as a pair of test points for the output (V_{OUT} and GND). Additionally, a jumperable R-C damper network can connect to V_{OUT} (J_1), and R_2 accepts surface mount or through-hole style resistors for output load testing.

ISL21080XXEV1Z Board

The schematic of the evaluation board is shown in [Figure 5](#). The ISL21080XXEV1Z contains the ISL21080 voltage reference (U_1), input decoupling capacitors (C_1 , C_2), and a load capacitor (C_3). The power supply leads attach to TP1 and TP2 (V_{IN} , GND). The output is measured at test points TP3 and TP4 (V_{OUT} , GND).

The R-C damper network is populated and can be connected to the reference output by adding a shunt to the R-C jumper (J_1). The damper network improves stability by reducing transient load ringing with high value ($>0.47\mu\text{F}$) capacitors.
