FN2856
Rev.7.00
October 24, 2013

The HA-2420 is a monolithic circuit consisting of a high performance operational amplifier with its output in series with an ultra-low leakage analog switch and JFET input unity gain amplifier.

With an external hold capacitor connected to the switch output, a versatile, high performance sample-and-hold or track-and-hold circuit is formed. When the switch is closed, the device behaves as an operational amplifier, and any of the standard op amp feedback networks may be connected around the device to control gain, frequency response, etc. When the switch is opened the output will remain at its last level.

Performance as a sample-and-hold compares very favorably with other monolithic, hybrid, modular, and discrete circuits. Accuracy to better than 0.01% is achievable over the temperature range. Fast acquisition is coupled with superior droop characteristics, even at high temperatures. High slew rate, wide bandwidth, and low acquisition time produce excellent dynamic characteristics. The ability to operate at gains greater than 1 frequently eliminates the need for external scaling amplifiers.

The device may also be used as a versatile operational amplifier with a gated output for applications such as analog switches, peak holding circuits, etc. For more information, please see Application Note [AN517](#).

Ordering Information

PART NUMBER	TEMP. RANGE (°C)	PACKAGE	PKG. DWG. #
HA1-2420-2	-55 to +125	14 Ld CERDIP	F14.3

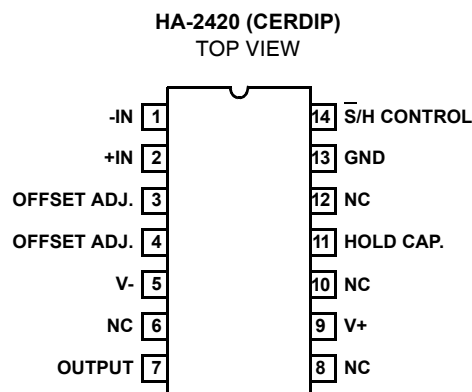

Features

- Maximum Acquisition Time
 - 10V Step to 0.1% 4μs (Max)
 - 10V Step to 0.01% 6μs (Max)
- Low Droop Rate (C_H = 1000pF) 5μV/ms (Typ)
- Gain Bandwidth Product 2.5MHz (Typ)
- Low Effective Aperture Delay Time 30ns (Typ)
- TTL Compatible Control Input
- ±12V to ±15V Operation

Applications

- 12-Bit Data Acquisition
- Digital to Analog Deglitcher
- Auto Zero Systems
- Peak Detector
- Gated Operational Amplifier

Pinout

Absolute Maximum Ratings

Voltage Between V+ and V- Terminals	.40V
Differential Input Voltage	.24V
Digital Input Voltage (Sample and Hold Pin)	+8V, -15V
Output Current	Short Circuit Protected

Operating Conditions

Temperature Range	
HA-2420-2	-55°C to +125°C
Supply Voltage Range (Typical)	±12V to ±15V

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTE:

1. θ_{JA} is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.

Thermal Information

Thermal Resistance (Typical, Note 1)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
CERDIP Package	75	20
Maximum Junction Temperature (Ceramic Packages)	+175°C	
Maximum Storage Temperature Range	-65°C to +150°C	
Maximum Lead Temperature (Soldering 10s)	+300°C	

Electrical Specifications Test Conditions (Unless Otherwise Specified) $V_{SUPPLY} = \pm 15.0V$; $C_H = 1000pF$; Digital Input: $V_{IL} = +0.8V$ (Sample), $V_{IH} = +2.0V$ (Hold), Unity Gain Configuration (Output tied to Negative Input)

Functional Diagram

Test Circuits and Waveforms

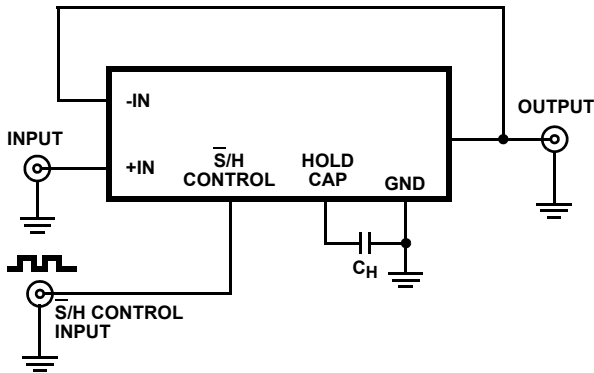

FIGURE 1. HOLD STEP ERROR AND DRIFT CURRENT

NOTE: Set rise/fall times of $\overline{S/H}$ Control to approximately 20ns.

FIGURE 2. HOLD STEP ERROR TEST

NOTE: Measure the slope of the output during hold, $\Delta V/\Delta t$, and compute drift current from: $I_D = C_H \Delta V/\Delta t$.

FIGURE 3. DRIFT CURRENT TEST

NOTE: Compute hold mode feedthrough attenuation from the formula:

$$\text{Feedthrough Attenuation} = 20 \log \frac{V_{OUT\text{-HOLD}}}{V_{IN\text{-HOLD}}}$$

Where $V_{OUT\text{-HOLD}}$ = Peak-to-Peak value of output sinewave during the hold mode.

Schematic Diagram

Application Information

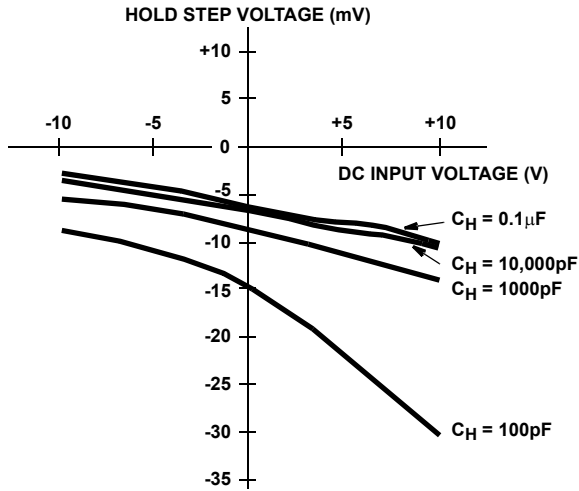

FIGURE 5. HOLD STEP vs INPUT VOLTAGE

Offset Adjustment

The offset voltage of the HA-2420, may be adjusted using a 100kΩ trim pot, as shown in Figure 8. The recommended adjustment procedure is:

Apply 0V to the sample-and-hold input, and a square wave to the $\overline{S/H}$ control.

Adjust the trim pot for 0V output in the hold mode.

Gain Adjustment

The linear variation in pedestal voltage with sample-and-hold input voltage causes a -0.06% gain error ($C_H = 1000pF$). In some applications (D/A deglitcher, A/D converter) the gain error can be adjusted elsewhere in the system, while in other applications it must be adjusted at the sample-and-hold. The two circuits shown below demonstrate how to adjust gain error at the sample-and-hold.

The recommended procedure for adjusting gain error is:

1. Perform offset adjustment.
2. Apply the nominal input voltage that should produce a +10V output.
3. Adjust the trim pot for +10V output in the hold mode.
4. Apply the nominal input voltage that should produce a -10V output.
5. Measure the output hold voltage ($V_{-10NOMINAL}$). Adjust the trim pot for an output hold voltage of

$$\frac{(V_{-10NOMINAL}) + (-10V)}{2}$$

FIGURE 6. INVERTING CONFIGURATION

FIGURE 7. NON-INVERTING CONFIGURATION

Figure 8 shows a typical unity gain circuit, with Offset Zeroing. All of the other normal op amp feedback configurations may be used with the HA-2420. The input amplifier may be used as a gated amplifier by utilizing Pin 11 as the output. This amplifier has excellent drive capabilities along with exceptionally low switch leakage.

FIGURE 8. BASIC SAMPLE-AND-HOLD (TOP VIEW)

The method used to reduce leakage paths on the PC board and the device package is shown in Figure 9. This guard ring is recommended to minimize the drift during hold mode.

The hold capacitor should have extremely high insulation resistance and low dielectric absorption. Polystyrene (below 85°C), Teflon, or Parlone types are recommended.

For more applications, consult Intersil Application Note [AN517](#), or the factory applications group.

Glossary of Terms

Acquisition Time

The time required following a “sample” command, for the output to reach its final value within $\pm 0.1\%$ or $\pm 0.01\%$. This is the minimum sample time required to obtain a given accuracy, and includes switch delay time, slewing time and settling time.

Aperture Time

The time required for the sample-and-hold switch to open, independent of delays through the switch driver and input amplifier circuitry. The switch opening time is that interval between the conditions of 10% open and 90% open.

Effective Aperture Delay Time (EADT)

The difference between the digital delay time from the Hold command to the opening of the S/H switch, and the propagation time from the analog input to the switch.

EADT may be positive, negative or zero. If zero, the S/H amplifier will output a voltage equal to V_{IN} at the instant the Hold command was received. For negative EADT, the output in Hold (exclusive of pedestal and droop errors) will correspond to a value of V_{IN} that occurred before the Hold command.

Aperture Uncertainty

The range of variation in Effective Aperture Delay Time. Aperture Uncertainty (also called Aperture Delay Uncertainty, Aperture Time Jitter, etc.) sets a limit on the accuracy with which a waveform can be reconstructed from sample data.

Drift Current

The net leakage current from the hold capacitor during the hold mode. Drift current can be calculated from the droop rate using the formula:

$$I_D \text{ (pA)} = C_H \text{ (pF)} \times \frac{\Delta V}{\Delta t} \text{ (V/s)}$$

NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark.
2. The maximum limits of lead dimensions b and c or M shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
3. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness.
4. Corner leads (1, N, N/2, and N/2+1) may be configured with a partial lead paddle. For this configuration dimension b3 replaces dimension b2.
5. This dimension allows for off-center lid, meniscus, and glass overrun.
6. Dimension Q shall be measured from the seating plane to the base plane.
7. Measure dimension S1 at all four corners.
8. N is the maximum number of terminal positions.
9. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
10. Controlling dimension: INCH.
