

ISL22511

Single Push Button Controlled Potentiometer (XDCP™) Low Noise, Low Power,
32 Taps, Push Button Controlled Potentiometer

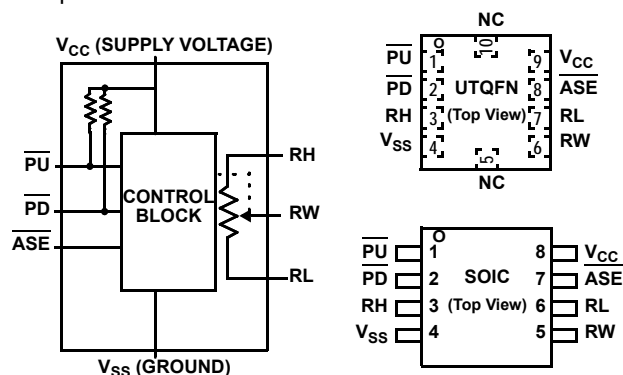

FN6678
Rev 2.00
September 9, 2015

The Intersil ISL22511 is a three-terminal digitally-controlled potentiometer (XDCP) implemented by a resistor array composed of 31 resistive elements and a wiper switching network. The ISL22511 features a push button control, a shutdown mode, as well as an industry-leading UTQFN package.

The push button control has individual $\overline{\text{PU}}$ and $\overline{\text{PD}}$ inputs for adjusting the wiper. To eliminate redundancy, the wiper position will automatically increment or decrement if one of these inputs is held longer than one second.

Forcing both $\overline{\text{PU}}$ and $\overline{\text{PD}}$ low for more than two seconds activates shutdown mode. Shutdown mode disconnects the top of the resistor chain and moves the wiper to the lowest position, minimizing power consumption.

The three terminals accessing the resistor chain naturally configure the ISL22511 as a voltage divider. A rheostat is easily formed by floating an end terminal or connecting it to the wiper.

Features

- Solid-State Non-Volatile Potentiometer
- Push Button Controlled
- Single or Auto Increment/Decrement
 - Fast Mode after 1s Button Press
- AUTOSTORE of Last Wiper Position or Manual Store of Wiper Position
- Shutdown Mode
- 32 Wiper Tap Points
 - Middle Scale Wiper Position on Power-Up
- Low Power CMOS
 - V_{CC} = 2.7V to 5.5V
 - Terminal Voltage, 0 to V_{CC}
 - Standby Current, 3μA Max
- R_{TOTAL} Value = 10kΩ, 50kΩ
- High reliability
 - Endurance: 1,000,000 data changes per bit per register
 - Register data retention: 50 years @ T ≤ +55°C
- Packages
 - 8 Ld SOIC
 - 10 Ld UTQFN (2.1mmx1.6mm)
- Pb-Free (RoHS Compliant)

Applications

- Volume Control
- LED/LCD Brightness Control
- Contrast Control
- Programming Bias Voltages
- Ladder Networks

*Add "-TK" suffix for tape and reel. Please refer to TB347 for details on reel specifications.

NOTES:

- These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

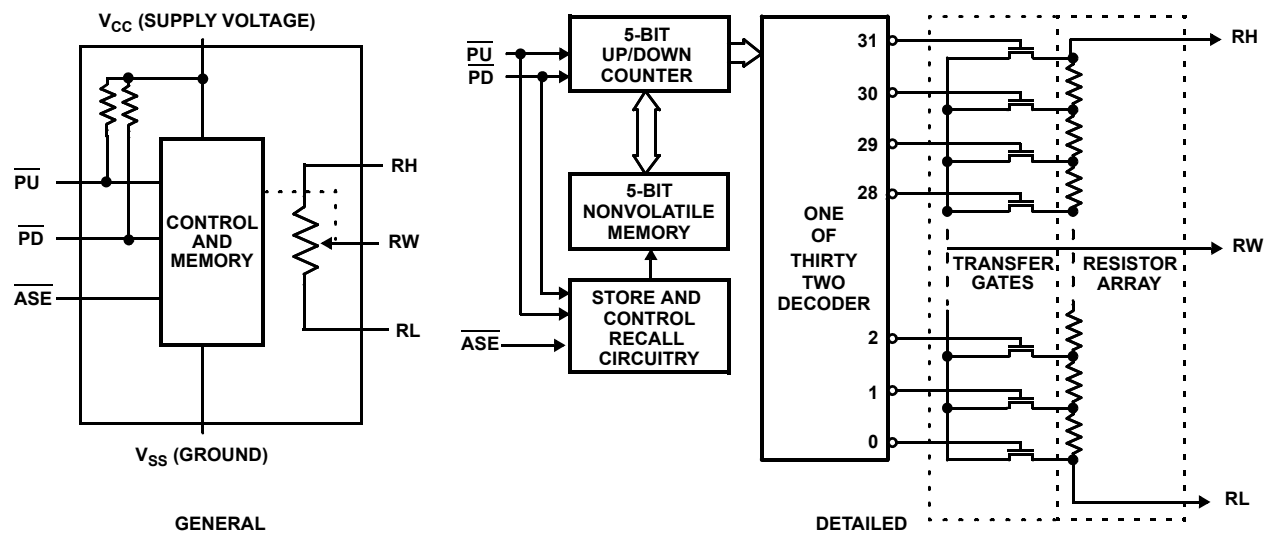

Pinouts

Pin Descriptions

SOIC PIN	UTQFN PIN	SYMBOL	BRIEF DESCRIPTION
1	1	\overline{PU}	The \overline{PU} is a falling-edge triggered input with internal pull-up. Toggling \overline{PU} will move the wiper close to RH terminal.
2	2	\overline{PD}	The \overline{PD} is a falling-edge triggered input with internal pull-up. Toggling \overline{PD} will move the wiper close to RL terminal.
3	3	RH	The RH and RL pins of the ISL22511 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is V_{SS} and the maximum is V_{CC} . The terminology of RH and RL references the relative position of the terminal in relation to wiper movement direction selected by the $\overline{PU}/\overline{PD}$ input.
4	4	V_{SS}	Ground
5	6	RW	The RW pin is the wiper terminal of the potentiometer which is equivalent to the movable terminal of a mechanical potentiometer.
6	7	RL	The RH and RL pins of the ISL22511 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is V_{SS} and the maximum is V_{CC} . The terminology of RH and RL references the relative position of the terminal in relation to wiper movement direction selected by the $\overline{PU}/\overline{PD}$ input.
7	8	\overline{ASE}	Active low AUTOSTORE enable input or Manual Store active low input.
8	9	V_{CC}	Supply Voltage.
-	5, 10	NC	No connection.

Block Diagrams

Absolute Maximum Ratings

Storage temperature	-65°C to +150°C
Voltage at PU and PD Pin with Respect to GND	-0.3V to $V_{CC} + 0.3V$
V_{CC}	-0.3V to +6V
Voltage at any DCP Pin with Respect to GND	-0.3V to V_{CC}
I_W (10s)	±6mA
Latchup	Class II, Level A @ +125°C
ESD Rating	
Human Body Model	4kV
Machine Model	300V

Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
8 Lead SOIC (Note 3)	125	N/A
10 Lead UTQFN (Notes 3, 4)	150	48.3
Maximum Junction Temperature (Plastic Package)	+150°C	
Pb-free Reflow Profile	see link below	
http://www.intersil.com/pbfree/Pb-FreeReflow.asp		

Recommended Operating Conditions

Temperature Range (Extended Industrial)	-40°C to +125°C
V_{CC}	2.7V to 5.5V
Power Rating	15mW
Wiper Current	±3.0mA

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

- θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
- θ_{JC} is for the location in the center of the exposed metal pad on the package underside.

Potentiometer Specifications Over recommended operating conditions, unless otherwise specified.

NOTES:

- Typical values are for $T_A = +25^\circ\text{C}$ and 3.3V supply voltage.
- LSB: $[V(RW)_{31} - V(RW)_0]/31$. $V(RW)_{31}$ and $V(RW)_0$ are voltage on RW pin for the DCP register set to 1F hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
- ZS error = $V(RW)_0/\text{LSB}$.
- FS error = $[V(RW)_{31} - V_{CC}]/\text{LSB}$.
- $\text{DNL} = [V(RW)_i - V(RW)_{i-1}]/\text{LSB} - 1$, for $i = 1$ to 31; i is the DCP register setting.
- $\text{INL} = [V(RW)_i - i \cdot \text{LSB} - V(RW)]/\text{LSB}$ for $i = 1$ to 31
- $T_{CV} = \frac{\text{Max}(V(RW)_i) - \text{Min}(V(RW)_i)}{[\text{Max}(V(RW)_i) + \text{Min}(V(RW)_i)]/2} \times \frac{10^6}{+165^\circ\text{C}}$ for $i = 5$ to 31 decimal, $T = -40^\circ\text{C}$ to $+125^\circ\text{C}$. $\text{Max}()$ is the maximum value of the wiper voltage and $\text{Min}()$ is the minimum value of the wiper voltage over the temperature range.
- $\text{MI} = |RW_{31} - RW_0|/31$. MI is a minimum increment. RW_{31} and RW_0 are the measured resistances for the DCP register set to 1F hex and 00 hex respectively.
- $\text{Roffset} = RW_0/\text{MI}$, when measuring between RW and RL.
 $\text{Roffset} = RW_{31}/\text{MI}$, when measuring between RW and RH.
- $\text{RDNL} = (RW_i - RW_{i-1})/\text{MI}$, for $i = 1$ to 31.
- $\text{RINL} = [RW_i - (\text{MI} \cdot i) - RW_0]/\text{MI}$, for $i = 1$ to 31.
- $T_{CR} = \frac{[\text{Max}(Ri) - \text{Min}(Ri)]}{[\text{Max}(Ri) + \text{Min}(Ri)]/2} \times \frac{10^6}{+165^\circ\text{C}}$ for $i = 5$ to 31, $T = -40^\circ\text{C}$ to $+125^\circ\text{C}$. $\text{Max}()$ is the maximum value of the resistance and $\text{Min}()$ is the minimum value of the resistance over the temperature range.
- Limits should be considered typical and are not production tested.
- Parameters with MIN and/or MAX limits are 100% tested at $+25^\circ\text{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

Slow Mode Timing

*MI in the AC timing diagram refers to the minimum incremental change in the wiper voltage.

Fast Mode Timing

* MI in the AC timing diagram refers to the minimum incremental change in the wiper voltage.

Shutdown Mode Timing

Power-Up and Down Requirements

There are no restrictions on the power-up or power-down conditions of V_{CC} and the voltages applied to the potentiometer pins provided that V_{CC} is always more positive than or equal to V_{RH} and V_{RL} , i.e., $V_{CC} \geq V_{RH}, V_{RL}$. The V_{CC} ramp rate specification is always in effect.

Pin Descriptions

RH and RL

The RH and RL pins of the ISL22511 are equivalent to the fixed terminals of a mechanical potentiometer. The minimum voltage is V_{SS} and the maximum is V_{CC} . The terminology of RH and RL references the relative position of the terminal in relation to wiper movement direction.

RW

The RW pin is the wiper terminal of the potentiometer which is equivalent to the movable terminal of a mechanical potentiometer.

\overline{PU}

The debounced \overline{PU} input is used to increment the wiper position. An on-chip pull-up holds the \overline{PU} input HIGH. A switch closure to ground or a LOW logic level will, after a debounce time, move the wiper to the next adjacent higher tap position.

\overline{PD}

The debounced \overline{PD} input is used to decrement the wiper position. An on-chip pull-up holds the \overline{PD} input HIGH. A switch closure to ground or a LOW logic level will, after a debounce time, move the wiper to the next adjacent lower tap position.

\overline{ASE}

The debounced \overline{ASE} (AUTOSTORE enable) pin can be in one of two states:

1. AUTOSTORE is enabled if \overline{ASE} is held LOW during power up.
2. AUTOSTORE is disabled if \overline{ASE} is held HIGH during power-up. A LOW to HIGH transition will initiate a manual store operation. This is for the user who wishes to connect a push button switch to this pin. For every valid push, the ISL22511 will store the current wiper position to the EEPROM.

Device Operation

There are three sections of the ISL22511: the input control, counter and decode section; the EEPROM memory; and the resistor array. The input control section operates just like an up/down counter. The output of this counter is decoded to turn on a single electronic switch, connecting a point on the resistor array to the wiper output. Under the proper conditions, the contents of the counter can be stored in EEPROM memory and retained for future use. The resistor array is comprised of 31 individual resistors connected in series. At either end of the array and between each resistor is an electronic switch that transfers the potential at that point to the wiper.

The ISL22511 is designed to interface directly to two push button switches for effectively moving the wiper up or down. The \overline{PU} and \overline{PD} inputs increment or decrement a 5-bit counter respectively. The output of this counter is decoded to select one of the thirty-two wiper positions along the resistive array. The wiper increment input, \overline{PU} and the wiper decrement input, \overline{PD} are both connected to an internal pull-up so that they normally remain HIGH. When pulled LOW by an external push button switch or a logic LOW level input, the wiper will be switched to the next adjacent tap position.

Internal debounce circuitry prevents inadvertent switching of the wiper position if \overline{PU} or \overline{PD} remain LOW for less than 15ms, typical. Each of the buttons can be pushed either once for a single increment/decrement or continuously for a multiple increments/decrements. The number of increments/decrements of the wiper position depends on how long the button is being pushed. When making a continuous push, after the first second, the increment/decrement speed increases. For the first second, the device will be in the slow scan mode. Then, if the button is held for longer than 1 second, the device will go into the fast scan mode. As soon as the button is released, the ISL22511 will return to a standby condition.

If two or more buttons are pressed simultaneously, all commands are ignored upon release of ALL buttons, except Shutdown Mode condition.

The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. That is, the counter does not wrap around when clocked to either extreme.

AUTOSTORE

The value of the counter is stored in EEPROM memory after 2 seconds of no activity on \overline{PU} or \overline{PD} inputs while \overline{ASE} is enabled (held LOW). When power is restored, the content of the memory is recalled and the counter resets to the last value stored.

If AUTOSTORE is to be implemented, \overline{ASE} is typically hard wired to V_{SS} . If \overline{ASE} is held HIGH during power-up and then taken LOW, the wiper will not respond to the \overline{PU} or \overline{PD} inputs until \overline{ASE} is brought HIGH and held HIGH.

Manual (Push Button) Store

When \overline{ASE} is not enabled (held HIGH), a push button switch may be used to pull \overline{ASE} LOW for more than 15ms and released to perform a manual store of the wiper position.

During memory write cycle all inputs will be ignored.

Shutdown Mode

The ISL22511 enters into Shutdown Mode if both \overline{PU} and \overline{PD} inputs are kept LOW for 2 seconds. In this mode, the resistors array is totally disconnected from its RH pin and the wiper is moved to position closest to RL pin, as shown in Figure 13. Note, that \overline{PU} and \overline{PD} inputs must be pulled LOW within t_{DB}

time window of 15ms, see "Shutdown Mode Timing" on page 7. Otherwise all command will be ignored till both inputs will be released.

FIGURE 13. DCP CONNECTION IN SHUTDOWN MODE

Holding either $\overline{\text{PU}}$, $\overline{\text{PD}}$ or $\overline{\text{ASE}}$ input LOW for more than 15ms will exit shutdown mode and return wiper to prior shutdown position. If $\overline{\text{PU}}$ or $\overline{\text{PD}}$ will be held LOW for more than 250ms, the ISL22511 will start auto-increment or auto-decrement of wiper position.

R_{TOTAL} with V_{CC} Removed

The end to end resistance of the array will fluctuate once V_{CC} is removed.

Package Outline Drawing

L10.2.1x1.6A

10 LEAD ULTRA THIN QUAD FLAT NO-LEAD PLASTIC PACKAGE

Rev 5, 3/10

NOTES:

1. Dimensioning and tolerancing conform to ASME Y14.5M-1994.
2. All Dimensions are in millimeters. Angles are in degrees. Dimensions in () for Reference Only.
3. Unless otherwise specified, tolerance : Decimal ± 0.05

4. Lead width dimension applies to the metallized terminal and is measured between 0.15mm and 0.30mm from the terminal tip.

5. Maximum package warpage is 0.05mm.

6. Maximum allowable burrs is 0.076mm in all directions.

7. Same as JEDEC MO-255UABD except:
No lead-pull-back, MIN. Package thickness = 0.45 not 0.50mm
Lead Length dim. = 0.45mm max. not 0.42mm.

8. The configuration of the pin #1 identifier is optional, but must be located within the zone indicated. The pin #1 identifier may be either a mold or mark feature.

Package Outline Drawing

M8.15

8 LEAD NARROW BODY SMALL OUTLINE PLASTIC PACKAGE

Rev 4, 1/12

NOTES:

1. Dimensioning and tolerancing per ANSI Y14.5M-1994.
2. Package length does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
3. Package width does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
4. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
5. Terminal numbers are shown for reference only.
6. The lead width as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch).
7. Controlling dimension: MILLIMETER. Converted inch dimensions are not necessarily exact.
8. This outline conforms to JEDEC publication MS-012-AA ISSUE C.
