

## LTC4267

Power over Ethernet Powered  
Device With 12V Isolated Supply**DESCRIPTION**

Demonstration circuit 1145B, featuring the LTC<sup>®</sup>4267, provides a complete IEEE 802.3af Powered Device (PD) interface and isolated 12V at 0.9A power supply solution for use in Power over Ethernet (PoE) applications. An optional connection is included for a 12V auxiliary supply on the secondary side that disables PoE when present.

The LTC4267 integrates the 25k signature resistor, classification current source, thermal overload protection, signature disable and power good signal along with an undervoltage lockout optimized for use with the IEEE required diode bridge. The precision dual level input cur-

rent limit allows the LTC4267 to charge load capacitors and interface with legacy PoE systems.

The LTC4267 combines the above features with a current mode switching controller designed for driving a 6V rated N-channel MOSFET. It features programmable slope compensation, soft-start, and constant frequency operation, minimizing electrical noise even with light loads.

**Design files for this circuit board are available at <http://www.linear.com/demo>**

**PERFORMANCE SUMMARY** ( $T_A = 25^{\circ}\text{C}$ )

PARAMETER	CONDITIONS	VALUE
Minimum Turn-on Voltage	Input from PSE, $I_{OUT} = 100\text{mA}$	39V
Maximum Turn-off Voltage	Input from PSE	33V
Operating PoE Voltage	Input from PSE, $I_{OUT} = 0$ to Maximum Output Current	37V to 57V
Maximum Input Current	Input from PSE	350mA
Maximum Output Current	Input from PSE, $V_{OUT} = 12\text{V}$	0.9A
Output Voltage	Input from PSE, $I_{OUT} = 0$ to Maximum Output Current	12V $\pm 2\%$
PD Power Class	$R_{CLASS} = R7 = 45.3\text{ Ohm}$	Class 3, 12.95W
Auxiliary input voltage	Input from auxiliary supply, dominant over PSE	10V to 16V
Invalid Signature	PD input, auxiliary supply present	9k $\Omega$

**OPERATING PRINCIPLES**

Demonstration circuit 1145B interfaces with a customer's PoE test setup per Figure 1. A PSE connects to DC1145B through RJ45 connector J1. The front end of the demo circuit includes the required Ethernet input interface transformer and common mode termination integrated in J1. The LTC4267 after J1 performs IEEE 802.3af interface functions while data is passed to connector J3 to connect to an optional PHY. The switching regulator function is also carried out by the LTC4267 to output an isolated 12V.

Diode bridges D2 and D6 provide the required auto-polarity on the data pairs and spare pairs while C3 provides the PD's 0.1 $\mu\text{F}$  capacitance during detection. This demo circuit allows detection and power classification of the PD per the IEEE 802.3af specification. During the detection process of a PD, the LTC4267 displays the proper 25k signature resistor. Classification is programmed by the selection of a single external resistor R7 connected to the  $R_{CLASS}$  pin. DC1145B is set for Class 3, full power PD of 12.95W at the input.

dc1145bf

## OPERATING PRINCIPLES

After detection and classification, the PD is powered up when the input voltage exceeds the LTC4267 turn-on under-voltage lock out (UVLO) through a dual-level current-limited power switch. The 5 $\mu$ F capacitance minimum requirement after the in-rush circuit is met with C1 and C9. While the voltage between P<sub>OUT</sub> and VPORTN is above the Power Good trip point, the amperage through the power switch is held below the low-level current limit. When the voltage between P<sub>OUT</sub> and VPORTN is below the Power Good trip point, the Power Good signal goes active low and the amperage through the power switch is held below the high level current limit.

For the PD to remain powered on, it must present to the PSE both AC and DC components of the Maintain Power Signature (MPS). The PD must hold the DC MPS by drawing at least 10mA or the PSE may disconnect power. To meet the AC MPS, the PD must present 27k $\Omega$  of AC impedance or less. The LTC4267 will remain on with a PSE that uses the AC disconnect method since it will always meet the AC MPS.

The LTC4267 flyback converter operates at a typical switching frequency of 200kHz, controlled by the current mode controller portion of the LT4267. Galvanic isolation

is achieved through transformer T1, capacitor C14 and opto-isolators ISO1 and ISO2.

The primary side power path is comprised of C1, L1, C9, ½ of T1, Q2, and R6. These components should be as close to each other as possible when laying out the printed circuit board. In an actual implementation, a snubber circuit can be added across Q2 to reduce voltage spikes seen at the FET. The secondary side power path is made up of the other ½ of T1, D1, C4, C5 and C6. These parts should also be laid out as close to each other as possible, without overlapping any of the circuitry or traces of the primary side.

When a 12V auxiliary supply is connected at connect J2, which takes over as the supply for the output. ISO2 provides an isolated signal from the auxiliary supply to disable the LTC4267. All LTC4267 signature detection, classification and the internal power MOSFET switch are disabled. A PSE that uses DC disconnect will remove power. The LTC4267 can resume normal PoE operation when the auxiliary supply is removed. If power was removed, then the PSE will perform a new detection and then power the device.

## QUICK START PROCEDURE

Demonstration circuit 1145B is easy to set up to evaluate the performance of the LTC4267. For proper equipment setup, refer to Figure 1 and follow the procedure below:

1. Apply an initial load of 100mA at  $V_{OUT}$ .
2. Connect a PoE compliant Power Sourcing Equipment (PSE) to RJ45 connector J1.
3. The PSE will detect and power up the PD. Verify output voltage measures 12V.
4. If the PSE has status readout, verify the proper PD power class 3 was detected.
5. In place of a PSE, the DC1145 board can be powered by an alternate input power supply. Connect 48V through the PoE+ and PoE- terminals.
6. Increase the load at  $V_{OUT}$  up to 0.9A. Observe the output regulation, ripple voltage, efficiency and other parameters
7. Measure  $\overline{PWRGD}$  and SIGDISA relative to POE-. Verify  $\overline{PWRGD}$  is logic low and SIGDISA is logic low.
8. Connect a 12V auxiliary supply and verify  $V_{OUT}$  equals the new supply.
9. Measure  $\overline{PWRGD}$  and SIGDISA relative to POE-. Verify  $\overline{PWRGD}$  is logic high and SIGDISA is logic high.
10. Remove the 12V auxiliary supply and verify the PSE power returns.

## DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

**Please read the DEMO BOARD manual prior to handling the product.** Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
