

LTC6363 Fully Differential Amplifier

DESCRIPTION

The LTC[®]6363 is a low power, low noise differential op amp with rail-to-rail output swing and good DC accuracy. The amplifier may be configured to process a fully differential input signal or to convert a single-ended input signal to a differential output signal. The differential outputs of the DC2319A can be configured with a first order RC network for driving the differential inputs of an ADC. The DC2319A can be DC-coupled or AC-coupled. Onboard jumpers configure the DC2319A for dual or single power supply. In addition, there are multiple optional surface-mount pads that can be used to change the LTC6363 configuration.

Design files for this circuit board are available at http://www.linear.com/demo/DC2319A

Table 1. LTC6363 Versions

PART NUMBER	DEMO CIRCUIT NUMBER	DESCRIPTION
LTC6363	DC2319A-A	Gain Set with External Resistors
LTC6363-1	DC2319A-B	Internal Gain Resistors G = 1
LTC6363-2	DC2319A-C	Internal Gain Resistors G = 2
LTC6363-05	DC2319A-D	Internal Gain Resistors G = 0.5

QUICK START PROCEDURE

Refer to Figure 1a. Check to ensure that both jumpers, JP1 and JP2, are set as shown. (JP1 to PWR_ON and JP2 to SINGLE SUPPLY). Power up the DC2319A from a single power supply, $V^+ = 5V$ and GND = 0V. Connect VIN⁻ to ground using E8. Connect an input voltage to VIN⁺ using E7. The differential output voltage can then be measured on VOUT⁻ and VOUT⁺ (E9 and E10). The outputs will be level-shifted to be balanced symmetrical around approximately 2.5V. The difference between the outputs will be the gain multiplied by the difference between the inputs.

For a similar setup using a split supply, change the setting of JP2 to DUAL SUPPLY, and connect a negative supply to V⁻. See Figure 1b.

QUICK START PROCEDURE

HARDWARE CONFIGURATION

Internal or External Gain Settings

Table 1 summarizes the gain settings for the various versions of DC2319A.

The LTC6363 (without suffix) is a non-committed op amp, which requires external feedback resistors to configure the gain. On the DC2319A-A, these resistors (R1, R2, R3, R4) are all set to 1k to configure a gain of G = 1, as shown in Figure 2. To set other gains, simply replace these resistors with other values.

Figure 2. DC2319A-A with External Gain Setting Resistors (LTC6363)

The versions of LTC6363 with suffix (LTC6363-1, LTC6363-2, LTC6363-05) include precision gain resistors internal to the IC. The IC already sets its own gain, to G = 1, G = 2 and G = 0.5 respectively, according to the suffix (see Table 1). Therefore, on DC2319A-B, DC2319A-C and DC2319A-D, the onboard feedback resistors (R3, R4) are not populated, and the input resistors (R1, R2) are shorted to 0Ω , resulting in the circuit of Figure 3.

Figure 3. DC2319A-B/-C/-D with Gain Setting Resistors Internal to the IC (LTC6363-1/-2/-05)

HARDWARE CONFIGURATION

Single-Ended Input to Differential Output

To configure the DC2319A for single-ended input to differential output, simply connect a DC bias (such as ground) to VIN^- and connect the input signal to VIN^+ . The differential output is measured on VOUT⁺ and VOUT⁻. The unused input can also be grounded on the board by populating R13 or R14.

Differential Input to Differential Output

To configure the DC2319A for differential input to differential output, simply connect the differential input signal to VIN⁺ and VIN⁻ respectively. The differential output is measured on VOUT⁺ and VOUT⁻.

AC-Coupled Applications

In the default configuration, both the inputs and outputs of the DC2319A are DC-coupled. To AC-couple the DC2319A, at either the inputs or outputs or both, simply replace the 0Ω resistors R5/R6/R11/R12 with appropriate value 0603 capacitors.

External Output Common Mode Adjust

The DC2319A is by default configured to bias the output common mode at the voltage determined by the LTC6363 IC, which is at approximately the mid-point between the amplifier's V⁺ and V⁻ pins. (For example, if single supply is used, the output common mode will be at half the V⁺ voltage).

To set a different value for the output common mode voltage, populate resistors R15 and R16. This will form a resistor divider in parallel with the resistor divider internal to the LTC6363 IC.

The most accurate way to set the output common mode voltage is by applying the desired DC bias to the EXT VOCM pin at E5. This will overdrive any of the on-chip or onboard resistor dividers.

Input or Output Filters

There are many 0Ω resistors and non-installed resistors or capacitors on the DC2319A board which can be populated by appropriate R and C values to configure lowpass filters at the inputs or outputs of the amplifier circuit.

Active Feedback Filters

Various optional feedback components (such as R17, R18, C15, C16, C17, C18) can be populated to configure differential active feedback filters. This is most relevant for the DC2319A-A (the version of LTC6363 without internal gain suffix). The other versions (with internal gain resistors) do not provide access to the internal amplifier feedback nodes, so that it is not possible to configure external feedback filters. See Table 1.

Layout

The DC2319A PCB layout demonstrates the known bestpractices of PCB layout to get the best performance out of the LTC6363. A ground plane is used, and supply bypass capacitors are close to the supply pins. Use a symmetrical layout around the analog inputs and outputs to minimize the effects of parasitic elements. Shield analog input and output traces with ground to minimize coupling from other traces. Feedback traces are as short as possible.

Nevertheless, the DC2319A is a general purpose applications board with many placeholders for optional components. After proto-typing a specific design on the DC2319A, a final PCB layout can be further optimized by removing the placeholders for the unused components. In addition, the DC2319A is designed to accommodate both single supply and dual supply circuits. A PCB design for a single supply application would connect the amplifier's V⁻ pin directly to the copper ground plane and use only one supply bypass capacitor directly between V⁺ and ground.

dc2319at

CONNECTORS AND JUMPERS

JP1: Jumper toggles the LTC6363 between SHDN and PWR ON.

JP2: Jumper toggles the SUPPLY between DUAL and SINGLE power supplies. If set to dual supply, connect a negative supply voltage to V⁻.

V⁺: Connect to Positive Power Supply.

GND: Connect to Ground. Available at multiple turrets on the board, all shorted together internally. Only need to connect one, others can be used as ground point for measurements.

V⁻: Negative Power Supply Voltage. No need to connect if JP2 is set to single supply.

EXT SHDN: Externally Drives the SHDN Pin. No need to connect. To turn the amplifier ON and OFF with a logic signal, remove JP1 (or set to the PWR ON position) and then connect an external logic signal here to EXT SHDN. (See LTC6363 data sheet for logic levels)

EXT VOCM: Externally Drives the VOCM Pin. The voltage on this pin sets the output common mode voltage level. If left floating (default setting), then an internal resistor divider develops a voltage that is approximately mid-way between the LTC6363 V⁺ and V⁻ supply rails.

VIN+: Connect noninverting input signal to the amplifier circuit. Available as SMA connector J1 and as turret E7.

VIN⁻: Connect inverting input signal to the amplifier circuit. Available as SMA connector J2 and as turret E8.

VOUT⁻: Measure inverting output signal from the amplifier circuit. Available as SMA connector J3 and as turret E9.

VOUT+: Measure noninverting output signal from the amplifier circuit. Available as SMA connector J4 and as turret E10.

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following AS IS conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.

LTC currently services a variety of customers for products around the world, and therefore this transaction is not exclusive.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. Common sense is encouraged.

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
