

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04

16-bit Digital Signal Controllers (up to 128 KB Flash and 16K SRAM) with Advanced Analog

Operating Conditions

- 3.0V to 3.6V, -40°C to +150°C, DC to 20 MIPS
- 3.0V to 3.6V, -40°C to +125°C, DC to 40 MIPS

Clock Management

- · 2% internal oscillator
- · Programmable PLL and oscillator clock sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timer
- · Low-power management modes
- · Fast wake-up and start-up

Core Performance

- Up to 40 MIPS 16-bit dsPIC33F CPU
- · Single-cycle MUL plus hardware divide

Advanced Analog Features

- 10/12-bit ADC with 1.1Msps/500 ksps rate:
 - Up to 13 ADC input channels and four S&H
 - Flexible/Independent trigger sources
- 150 ns Comparators:
 - Up to two Analog Comparator modules
 - 4-bit DAC with two ranges for Analog Comparators

Input/Output

- Software remappable pin functions
- 5V-tolerant pins
- · Selectable open drain and internal pull-ups
- Up to 5 mA overvoltage clamp current/pin
- · Multiple external interrupts

System Peripherals

- 16-bit dual channel 100 ksps Audio DAC
- Cyclic Redundancy Check (CRC) module
- Up to five 16-bit and up to two 32-bit Timers/ Counters
- Up to four Input Capture (IC) modules
- Up to four Output Compare (OC) modules
- · Real-Time Clock and Calendar (RTCC) module

Communication Interfaces

- Parallel Master Port (PMP)
- Two UART modules (10 Mbps)
 - Supports LIN 2.0 protocols
 - RS-232, RS-485, and IrDA[®] support
- Two 4-wire SPI modules (15 Mbps)
- Enhanced CAN (ECAN) module (1 Mbaud) with 2.0B support
- I²C module (100K, 400K and 1Mbaud) with SMbus support
- Data Converter Interface (DCI) module with I²S codec support

Direct Memory Access (DMA)

- · 8-channel DMA with no CPU stalls or overhead
- UART, SPI, ADC, ECAN, IC, OC, INTO

Qualification and Class B Support

- AEC-Q100 REVG (Grade 0 -40°C to +150°C)
- · Class B Safety Library, IEC 60730, VDE certified

Debugger Development Support

- · In-circuit and in-application programming
- Two program breakpoints
- · Trace and run-time watch

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com** or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

Referenced Sources

This device data sheet is based on the following individual chapters of the *"dsPIC33F/PIC24H Family Reference Manual"*. These documents should be considered as the general reference for the operation of a particular module or device feature.

Note 1: To access the documents listed below, browse to the documentation section of the dsPIC33FJ64GP804 product page of the Microchip web site (www.microchip.com) or select a family reference manual section from the following list.

In addition to parameters, features, and other documentation, the resulting page provides links to the related family reference manual sections.

- Section 1. "Introduction" (DS70197)
- Section 2. "CPU" (DS70204)
- Section 3. "Data Memory" (DS70202)
- Section 4. "Program Memory" (DS70203)
- Section 5. "Flash Programming" (DS70191)
- Section 8. "Reset" (DS70192)
- Section 9. "Watchdog Timer and Power-Saving Modes" (DS70196)
- Section 11. "Timers" (DS70205)
- Section 12. "Input Capture" (DS70198)
- Section 13. "Output Compare" (DS70209)
- Section 16. "Analog-to-Digital Converter (ADC)" (DS70183)
- Section 17. "UART" (DS70188)
- Section 18. "Serial Peripheral Interface (SPI)" (DS70206)
- Section 19. "Inter-Integrated Circuit™ (I²C™)" (DS70195)
- Section 23. "CodeGuard™ Security" (DS70199)
- Section 24. "Programming and Diagnostics" (DS70207)
- Section 25. "Device Configuration" (DS70194)
- Section 30. "I/O Ports with Peripheral Pin Select (PPS)" (DS70190)
- Section 32. "Interrupts (Part III)" (DS70214)
- Section 33. "Audio Digital-to-Analog Converter (DAC)" (DS70211)
- Section 34. "Comparator" (DS70212)
- Section 35. "Parallel Master Port (PMP)" (DS70299)
- Section 36. "Programmable Cyclic Redundancy Check (CRC)" (DS70298)
- Section 37. "Real-Time Clock and Calendar (RTCC)" (DS70301)

- Section 39. "Oscillator (Part III)" (DS70216)

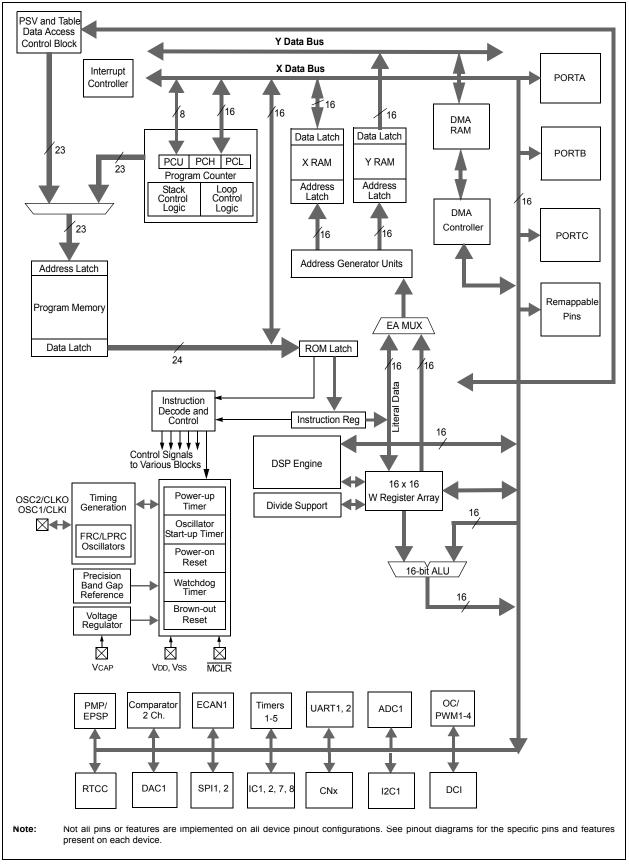

1.0 DEVICE OVERVIEW

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC33F/PIC24H Family Reference Manual". Please see the Microchip web site (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual sections.
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

This document contains device specific information for the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 Digital Signal Controller (DSC) Devices. The dsPIC33F devices contain extensive Digital Signal Processor (DSP) functionality with a high performance 16-bit microcontroller (MCU) architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules in the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

| TABLE 1-1: | PINOU | T I/O DESC | CRIPTI | ONS |
|---------------------|-------------|----------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pin Name | Pin Type | Buffer Type | PPS | Description |
| AN0-AN12 | I | Analog | | Analog input channels. |
| CLKI | I | ST/CMOS | No | External clock source input. Always associated with OSC1 pin function. |
| CLKO | 0 | _ | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function. |
| OSC1 | I | ST/CMOS | No | Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise. |
| OSC2 | I/O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. |
| SOSCI SOSCO | I O | ST/CMOS | No No | 32.768 kHz low-power oscillator crystal input; CMOS otherwise. 32.768 kHz low-power oscillator crystal output. |
| CN0-CN30 | I | ST | No No | Change notification inputs. Can be software programmed for internal weak pull-ups on all inputs. |
| IC1-IC2 IC7-IC8 | I I | ST ST | Yes Yes | Capture inputs 1/2. Capture inputs 7/8. |
| OCFA OC1-OC4 | I O | ST — | Yes Yes | Compare Fault A input (for Compare Channels 1, 2, 3 and 4). Compare outputs 1 through 4. |
| INT0 | I | ST | No | External interrupt 0. |
| INT1 INT2 | 1 | ST | Yes | External interrupt 1. |
| | | ST | Yes | External interrupt 2. |
| RA0-RA4 RA7-RA10 | 1/O 1/O | ST ST | No No | PORTA is a bidirectional I/O port. PORTA is a bidirectional I/O port. |
| RB0-RB15 | I/O | ST | No | PORTB is a bidirectional I/O port. |
| RC0-RC9 | I/O | ST | No | PORTC is a bidirectional I/O port. |
| TICK | 1 | ST | No | Timer1 external clock input. |
| T2CK | i | ST | Yes | Timer2 external clock input. |
| ТЗСК | I | ST | Yes | Timer3 external clock input. |
| T4CK | | ST | Yes | Timer4 external clock input. |
| T5CK | | ST | Yes | Timer5 external clock input. |
| U1CTS | 0 | ST | Yes Yes | UART1 clear to send. UART1 ready to send. |
| U1RTS | I | ST | Yes | UART1 receive. |
| U1RX U1TX | Ó | _ | Yes | UART1 transmit. |
| U2CTS | 1 | ST | Yes | UART2 clear to send. |
| U2RTS | 0 | _ | Yes | UART2 ready to send. |
| U2RX | | ST | Yes | UART2 receive. |
| U2TX | 0 | _ | Yes | UART2 transmit. |
| SCK1 | I/O | ST | Yes | Synchronous serial clock input/output for SPI1. |
| SDI1 SDO1 | | ST | Yes | SPI1 data in. |
| SS1 | 0 I/O | ST | Yes Yes | SPI1 data out. SPI1 slave synchronization or frame pulse I/O. |
| SCK2 | I/O | ST | Yes | Synchronous serial clock input/output for SPI2. |
| SDI2 | г Г | ST | Yes | SPI2 data in. |
| SDO2 | Ó | _ | Yes | SPI2 data out. |
| SS2 | I/O | ST | Yes | SPI2 slave synchronization or frame pulse I/O. |
| | | S compatible | | |

NOTES:

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS

- Note 1: This data sheet summarizes the features dsPIC33FJ32GP302/304, the of dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

2.1 Basic Connection Requirements

Getting started with the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/ X04 family of 16-bit Digital Signal Controllers (DSCs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and Vss pins (see Section 2.2 "Decoupling Capacitors")
- All AVDD and AVSS pins (regardless if ADC module is not used)

(see Section 2.2 "Decoupling Capacitors")
• VCAP

- (see Section 2.3 "CPU Logic Filter Capacitor Connection (VCAP)")
- MCLR pin (see Section 2.4 "Master Clear (MCLR) Pin")
- PGECx/PGEDx pins used for In-Circuit Serial Programming[™] (ICSP[™]) and debugging purposes (see Section 2.5 "ICSP Pins")
- OSC1 and OSC2 pins when external oscillator source is used

(see Section 2.6 "External Oscillator Pins")

Additionally, the following pins may be required:

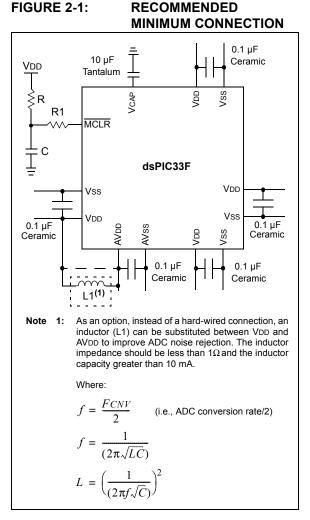

- VREF+/VREF- pins used when external voltage reference for ADC module is implemented
 - Note: The AVDD and AVSS pins must be connected independent of the ADC voltage reference source.

2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- Value and type of capacitor: Recommendation of 0.1 μ F (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended that ceramic capacitors be used.
- Placement on the printed circuit board: The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- Handling high frequency noise: If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μ F to 0.001 μ F. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μ F in parallel with 0.001 μ F.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

2.3 **CPU Logic Filter Capacitor Connection (VCAP)**

A low-ESR (< 5 Ohms) capacitor is required on the VCAP pin, which is used to stabilize the voltage regulator output voltage. The VCAP pin must not be connected to VDD, and must have a capacitor between 4.7 µF and 10 µF, preferably surface mount connected within one-eights inch of the VCAP pin connected to ground. The type can be ceramic or tantalum. Refer to Section 30.0 "Electrical Characteristics" for additional information.

The placement of this capacitor should be close to the VCAP. It is recommended that the trace length not exceed one-guarter inch (6 mm). Refer to Section 27.2 "On-Chip Voltage Regulator" for details.

Master Clear (MCLR) Pin 2.4

The MCLR pin provides for two specific device functions:

- Device Reset
- · Device programming and debugging

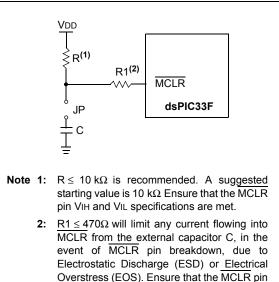

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the MCLR pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in Figure 2-2, it is recommended that the capacitor C, be isolated from the MCLR pin during programming and debugging operations.

Place the components shown in Figure 2-2 within one-quarter inch (6 mm) from the MCLR pin.

EXAMPLE OF MCLR PIN CONNECTIONS

VIH and VIL specifications are met.

2.5 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial ProgrammingTM (ICSPTM) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes, and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

Ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB[®] ICD 3 or MPLAB REAL ICE[™].

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip website.

- "Using MPLAB[®] ICD 3 In-Circuit Debugger" (poster) DS51765
- "MPLAB[®] ICD 3 Design Advisory" DS51764
- "MPLAB[®] REAL ICE™ In-Circuit Emulator User's Guide" DS51616
- *"Using MPLAB[®] REAL ICE™"* (poster) DS51749

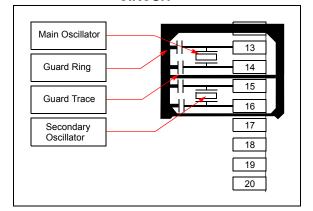

2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 9.0 "Oscillator Configuration**" for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in Figure 2-3. Recommendations for crystals and ceramic resonators are provided in Table 2-1 and Table 2-2, respectively.

FIGURE 2-3:

SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

TABLE 2-2: RESONATOR RECOMMENDATIONS

Legend: TH = Through Hole

2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to ≤8 MHz for start-up with the PLL enabled to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start-up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLDBF to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration word.

2.8 Configuration of Analog and Digital Pins During ICSP Operations

If MPLAB ICD 3 or REAL ICE is selected as a debugger, it automatically initializes all of the analog-to-digital input pins (ANx) as "digital" pins, by setting all bits in the AD1PCFGL register.

The bits in this register that correspond to the analog-to-digital pins that are initialized by MPLAB ICD 3 or REAL ICE, must not be cleared by the user application firmware; otherwise, communication errors will result between the debugger and the device.

If your application needs to use certain analog-to-digital pins as analog input pins during the debug session, the user application must clear the corresponding bits in the AD1PCFGL register during initialization of the ADC module.

When MPLAB ICD 3 or REAL ICE is used as a programmer, the user application firmware must correctly configure the AD1PCFGL register. Automatic initialization of this register is only done during debugger operation. Failure to correctly configure the register(s) will result in all analog-to-digital pins being recognized as analog input pins, resulting in the port value being read as a logic '0', which may affect user application functionality.

2.9 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic-low state.

Alternatively, connect a 1k to 10k resistor between Vss and the unused pin.

3.0 CPU

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 2. "CPU" (DS70204) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

3.1 Overview

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for DSP. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies by device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double-word move (MOV.D) instruction and the table instructions. Overhead-free program loop constructs are supported using the DO and REPEAT instructions, both of which are interruptible at any time.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can serve as a data, address or address offset register. The 16th working register (W15) operates as a software Stack Pointer (SP) for interrupts and calls.

There are two classes of instruction in the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices: MCU and DSP. These two instruction classes are seamlessly integrated into a single CPU. The instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and

a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing A + B = C operations to be executed in a single cycle.

A block diagram of the CPU is shown in Figure 3-1, and the programmer's model for the dsPIC33FJ32GP302/ 304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 is shown in Figure 3-2.

3.2 Data Addressing Overview

The data space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

Overhead-free circular buffers (Modulo Addressing mode) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU circular addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program-to-data-space mapping feature lets any instruction access program space as if it were data space.

3.3 DSP Engine Overview

The DSP engine features a high-speed 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value up to 16 bits right or left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal realtime performance. The MAC instruction and other associated instructions can concurrently fetch two data operands from memory while multiplying two W registers and accumulating and optionally saturating the result in the same cycle. This instruction functionality requires that the RAM data space be split for these instructions and linear for all others. Data space partitioning is achieved in a transparent and flexible manner through dedicating certain working registers to each address space.

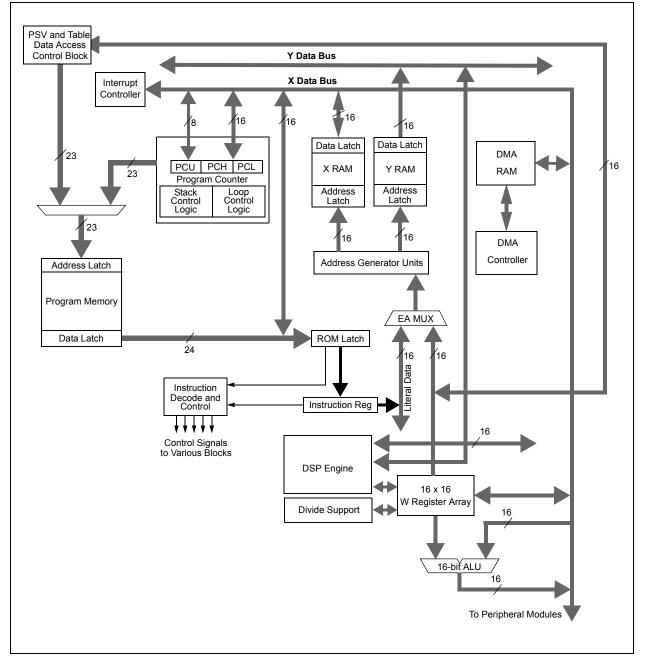

^{© 2007-2012} Microchip Technology Inc.

3.4 Special MCU Features

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 features a 17-bit by 17-bit single-cycle multiplier that is shared by both the MCU ALU and DSP engine. The multiplier can perform signed, unsigned and mixed-sign multiplication. Using a 17-bit by 17-bit multiplier for 16-bit by 16-bit multiplication not only allows you to perform mixed-sign multiplication, it also achieves accurate results for special operations, such as (-1.0) x (-1.0). The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 supports 16/16 and 32/16 divide operations, both fractional and integer. All divide instructions are iterative operations. They must be executed within a REPEAT loop, resulting in a total execution time of 19 instruction cycles. The divide operation can be interrupted during any of those 19 cycles without loss of data.

A 40-bit barrel shifter is used to perform up to a 16-bit left or right shift in a single cycle. The barrel shifter can be used by both MCU and DSP instructions.

3.7 Arithmetic Logic Unit (ALU)

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the <u>SR register</u>. The <u>C and DC</u> Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the *"16-bit MCU and DSC Programmer's Reference Manual"* (DS70157) for information on the SR bits affected by each instruction.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit-divisor division.

3.7.1 MULTIPLIER

Using the high-speed 17-bit x 17-bit multiplier of the DSP engine, the ALU supports unsigned, signed or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- · 8-bit unsigned x 8-bit unsigned

3.7.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 1. 32-bit signed/16-bit signed divide
- 2. 32-bit unsigned/16-bit unsigned divide
- 3. 16-bit signed/16-bit signed divide
- 4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. 16-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.8 DSP Engine

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a barrel shifter and a 40-bit adder/ subtracter (with two target accumulators, round and saturation logic).

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 is a single-cycle instruction flow architecture; therefore, concurrent operation of the DSP engine with MCU instruction flow is not possible. However, some MCU ALU and DSP engine resources can be used concurrently by the same instruction (e.g., ED, EDAC).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are ADD, SUB and NEG.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- · Fractional or integer DSP multiply (IF)
- Signed or unsigned DSP multiply (US)
- Conventional or convergent rounding (RND)
- · Automatic saturation on/off for ACCA (SATA)
- · Automatic saturation on/off for ACCB (SATB)
- Automatic saturation on/off for writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACC-SAT)

A block diagram of the DSP engine is shown in Figure 3-3.

TABLE 3-1:DSP INSTRUCTIONSSUMMARY

| Instruction | Algebraic Operation | ACC Write Back |
|-------------|-------------------------|-------------------|
| CLR | A = 0 | Yes |
| ED | $A = (x - y)^2$ | No |
| EDAC | $A = A + (x - y)^2$ | No |
| MAC | $A = A + (x \bullet y)$ | Yes |
| MAC | A = A + x2 | No |
| MOVSAC | No change in A | Yes |
| MPY | $A = x \bullet y$ | No |
| MPY | A = x 2 | No |
| MPY.N | $A = -x \bullet y$ | No |
| MSC | $A = A - x \bullet y$ | Yes |

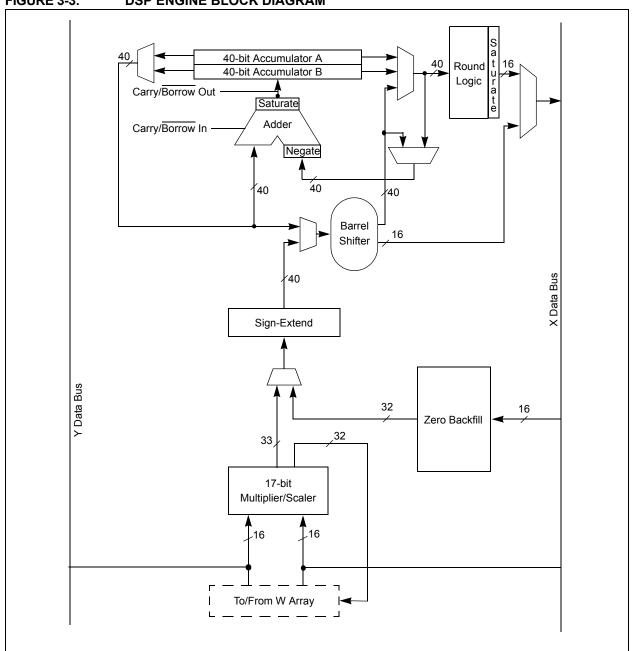

FIGURE 3-3: DSP ENGINE BLOCK DIAGRAM

3.8.1 MULTIPLIER

The 17-bit x 17-bit multiplier is capable of signed or unsigned operation and can multiplex its output using a scaler to support either 1.31 fractional (Q31) or 32-bit integer results. Unsigned operands are zero-extended into the 17th bit of the multiplier input value. Signed operands are sign-extended into the 17th bit of the multiplier input value. The output of the 17-bit x 17-bit multiplier/scaler is a 33-bit value that is sign-extended to 40 bits. Integer data is inherently represented as a signed two's complement value, where the Most Significant bit (MSb) is defined as a sign bit. The range of an N-bit two's complement integer is -2^{N-1} to $2^{N-1} - 1$.

- For a 16-bit integer, the data range is -32768 (0x8000) to 32767 (0x7FFF) including 0.
- For a 32-bit integer, the data range is -2,147,483,648 (0x8000 0000) to 2,147,483,647 (0x7FFF FFFF).

When the multiplier is configured for fractional multiplication, the data is represented as a two's complement fraction, where the MSb is defined as a sign bit and the radix point is implied to lie just after the sign bit (QX format). The range of an N-bit two's complement fraction with this implied radix point is -1.0 to $(1 - 2^{1-N})$. For a 16-bit fraction, the Q15 data range is -1.0 (0x8000) to 0.999969482 (0x7FFF) including 0 and has a precision of 3.01518x10⁻⁵. In Fractional mode, the 16 x 16 multiply operation generates a 1.31 product that has a precision of 4.65661 x 10⁻¹⁰.

The same multiplier is used to support the MCU multiply instructions, which include integer 16-bit signed, unsigned and mixed sign multiply operations.

The MUL instruction can be directed to use byte or word-sized operands. Byte operands direct a 16-bit result, and word operands direct a 32-bit result to the specified registers in the W array.

3.8.2 DATA ACCUMULATORS AND ADDER/SUBTRACTER

The data accumulator consists of a 40-bit adder/ subtracter with automatic sign extension logic. It can select one of two accumulators (A or B) as its preaccumulation source and post-accumulation destination. For the ADD and LAC instructions, the data to be accumulated or loaded can be optionally scaled using the barrel shifter prior to accumulation.

3.8.2.1 Adder/Subtracter, Overflow and Saturation

The adder/subtracter is a 40-bit adder with an optional zero input into one side, and either true or complement data into the other input.

- In the case of addition, the Carry/Borrow input is active-high and the other input is true data (not complemented).
- In the case of subtraction, the Carry/Borrow input is active-low and the other input is complemented.

The adder/subtracter generates Overflow Status bits, SA/SB and OA/OB, which are latched and reflected in the STATUS register:

- Overflow from bit 39: this is a catastrophic overflow in which the sign of the accumulator is destroyed.
- Overflow into guard bits 32 through 39: this is a recoverable overflow. This bit is set whenever all the guard bits are not identical to each other.

The adder has an additional saturation block that controls accumulator data saturation, if selected. It uses the result of the adder, the Overflow Status bits described previously and the SAT<A:B> (CORCON<7:6>) and ACCSAT (CORCON<4>) mode control bits to determine when and to what value to saturate.

Six STATUS register bits support saturation and overflow:

- · OA: ACCA overflowed into guard bits
- · OB: ACCB overflowed into guard bits

or

• SA: ACCA saturated (bit 31 overflow and saturation)

ACCA overflowed into guard bits and saturated (bit 39 overflow and saturation)

 SB: ACCB saturated (bit 31 overflow and saturation) or

ACCB overflowed into guard bits and saturated (bit 39 overflow and saturation)

- OAB: Logical OR of OA and OB
- · SAB: Logical OR of SA and SB

The OA and OB bits are modified each time data passes through the adder/subtracter. When set, they indicate that the most recent operation has overflowed into the accumulator guard bits (bits 32 through 39). The OA and OB bits can also optionally generate an arithmetic warning trap when set and the corresponding Overflow Trap Flag Enable bits (OVATE, OVBTE) in the INTCON1 register are set (refer to **Section 7.0 "Interrupt Controller**"). This allows the user application to take immediate action, for example, to correct the system gain.

The SA and SB bits are modified each time data passes through the adder/subtracter, but can only be cleared by the user application. When set, they indicate that the accumulator has overflowed its maximum range (bit 31 for 32-bit saturation or bit 39 for 40-bit saturation) and is saturated (if saturation is enabled). When saturation is not enabled, SA and SB default to bit 39 overflow and thus indicate that a catastrophic overflow has occurred. If the COVTE bit in the INTCON1 register is set, the SA and SB bits generate an arithmetic warning trap when saturation is disabled. The Overflow and Saturation Status bits can optionally be viewed in the STATUS Register (SR) as the logical OR of OA and OB (in bit OAB) and the logical OR of SA and SB (in bit SAB). Programmers can check one bit in the STATUS register to determine if either accumulator has overflowed, or one bit to determine if either accumulator has saturated. This is useful for complex number arithmetic, which typically uses both accumulators.

The device supports three Saturation and Overflow modes:

• Bit 39 Overflow and Saturation:

When bit 39 overflow and saturation occurs, the saturation logic loads the maximally positive 9.31 (0x7FFFFFFFFF) or maximally negative 9.31 value (0x800000000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. This condition is referred to as 'super saturation' and provides protection against erroneous data or unexpected algorithm problems (such as gain calculations).

- Bit 31 Overflow and Saturation: When bit 31 overflow and saturation occurs, the saturation logic then loads the maximally positive 1.31 value (0x007FFFFFFF) or maximally negative 1.31 value (0x008000000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. When this Saturation mode is in effect, the guard bits are not used, so the OA, OB or OAB bits are never set.
- Bit 39 Catastrophic Overflow: The bit 39 Overflow Status bit from the adder is used to set the SA or SB bit, which remains set until cleared by the user application. No saturation operation is performed, and the accumulator is allowed to overflow, destroying its sign. If the COVTE bit in the INTCON1 register is set, a catastrophic overflow can initiate a trap exception.

3.8.3 ACCUMULATOR 'WRITE BACK'

The MAC class of instructions (with the exception of MPY, MPY.N, ED and EDAC) can optionally write a rounded version of the high word (bits 31 through 16) of the accumulator that is not targeted by the instruction into data space memory. The write is performed across the X bus into combined X and Y address space. The following addressing modes are supported:

- W13, Register Direct: The rounded contents of the non-target accumulator are written into W13 as a 1.15 fraction.
- [W13] + = 2, Register Indirect with Post-Increment: The rounded contents of the non-target accumulator are written into the address pointed to by W13 as a 1.15 fraction. W13 is then incremented by 2 (for a word write).

3.8.3.1 Round Logic

The round logic is a combinational block that performs a conventional (biased) or convergent (unbiased) round function during an accumulator write (store). The Round mode is determined by the state of the RND bit in the CORCON register. It generates a 16-bit, 1.15 data value that is passed to the data space write saturation logic. If rounding is not indicated by the instruction, a truncated 1.15 data value is stored and the least significant word is simply discarded.

Conventional rounding zero-extends bit 15 of the accumulator and adds it to the ACCxH word (bits 16 through 31 of the accumulator).

- If the ACCxL word (bits 0 through 15 of the accumulator) is between 0x8000 and 0xFFFF (0x8000 included), ACCxH is incremented.
- If ACCxL is between 0x0000 and 0x7FFF, ACCxH is left unchanged.

A consequence of this algorithm is that over a succession of random rounding operations, the value tends to be biased slightly positive.

Convergent (or unbiased) rounding operates in the same manner as conventional rounding, except when ACCxL equals 0x8000. In this case, the Least Significant bit (bit 16 of the accumulator) of ACCxH is examined:

- If it is '1', ACCxH is incremented.
- If it is '0', ACCxH is not modified.

Assuming that bit 16 is effectively random in nature, this scheme removes any rounding bias that may accumulate.

The SAC and SAC.R instructions store either a truncated (SAC), or rounded (SAC.R) version of the contents of the target accumulator to data memory via the X bus, subject to data saturation (see **Section 3.8.3.2 "Data Space Write Saturation**"). For the MAC class of instructions, the accumulator writeback operation functions in the same manner, addressing combined MCU (X and Y) data space though the X bus. For this class of instructions, the data is always subject to rounding.

3.8.3.2 Data Space Write Saturation

In addition to adder/subtracter saturation, writes to data space can also be saturated, but without affecting the contents of the source accumulator. The data space write saturation logic block accepts a 16-bit, 1.15 fractional value from the round logic block as its input, together with overflow status from the original source (accumulator) and the 16-bit round adder. These inputs are combined and used to select the appropriate 1.15 fractional value as output to write to data space memory.

If the SATDW bit in the CORCON register is set, data (after rounding or truncation) is tested for overflow and adjusted accordingly:

- For input data greater than 0x007FFF, data written to memory is forced to the maximum positive 1.15 value, 0x7FFF.
- For input data less than 0xFF8000, data written to memory is forced to the maximum negative 1.15 value, 0x8000.

The Most Significant bit of the source (bit 39) is used to determine the sign of the operand being tested.

If the SATDW bit in the CORCON register is not set, the input data is always passed through unmodified under all conditions.

3.8.4 BARREL SHIFTER

The barrel shifter can perform up to 16-bit arithmetic or logic right shifts, or up to 16-bit left shifts in a single cycle. The source can be either of the two DSP accumulators or the X bus (to support multi-bit shifts of register or memory data).

The shifter requires a signed binary value to determine both the magnitude (number of bits) and direction of the shift operation. A positive value shifts the operand right. A negative value shifts the operand left. A value of '0' does not modify the operand.

The barrel shifter is 40 bits wide, thereby obtaining a 40-bit result for DSP shift operations and a 16-bit result for MCU shift operations. Data from the X bus is presented to the barrel shifter between bit positions 16 and 31 for right shifts, and between bit positions 0 and 16 for left shifts.

4.0 MEMORY ORGANIZATION

| Note: | This data sheet summarizes the features |
|-------|-----------------------------------------|
| | of the dsPIC33FJ32GP302/304, |
| | dsPIC33FJ64GPX02/X04, and |
| | dsPIC33FJ128GPX02/X04 families of |
| | devices. It is not intended to be a |
| | comprehensive reference source. To |

| | Memory" (DS70203) of the "dsPIC33F/ |
| | PIC24H Family Reference Manual", which |
| | is available from the Microchip website |
| | (www.microchip.com). |

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the data space during code execution.

4.1 Program Address Space

The program address memory space of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in Section 4.8 "Interfacing Program and Data Memory Spaces".

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

The memory map for the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices is shown in Figure 4-1.

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in wordaddressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-2).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices reserve the addresses between 0x00000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at 0x000000, with the actual address for the start of code at 0x000002.

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices also have two interrupt vector tables, located from 0x000004 to 0x0000FF and 0x000100 to 0x0001FF. These vector tables allow each of the device interrupt sources to be handled by separate Interrupt Service Routines (ISRs). A more detailed discussion of the interrupt vector tables is provided in **Section 7.1 "Interrupt Vector Table**".

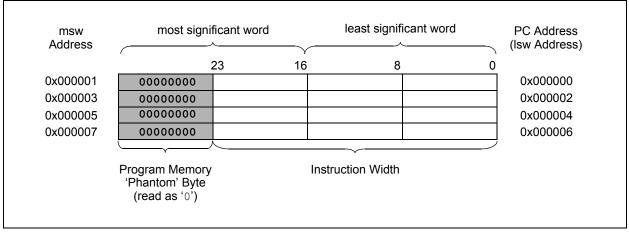

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

4.2 Data Address Space

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 CPU has a separate 16-bit-wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps is shown in Figure 4-4.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when EA<15>=0) is used for implemented memory addresses, while the upper half (EA<15> = 1) is reserved for the Program Space Visibility area (see Section 4.8.3 "Reading Data from Program Memory Using Program Space Visibility").

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices implement up to 16 Kbytes of data memory. Should an EA point to a location outside of this area, an all-zero word or byte is returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC[®] MCU devices and improve data space memory usage efficiency, the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 instruction set supports both word and byte operations. As a consequence of byte accessibility, all effective address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read, reads the complete word that contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address. All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the Least Significant Byte. The Most Significant Byte is not modified.

A sign-extend instruction (SE) is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a zero-extend (ZE) instruction on the appropriate address.

4.2.3 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0x0000 to 0x07FF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control, and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'.

Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information.

4.2.4 NEAR DATA SPACE

The 8 Kbyte area between 0x0000 and 0x1FFF is referred to as the near data space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a working register as an address pointer.

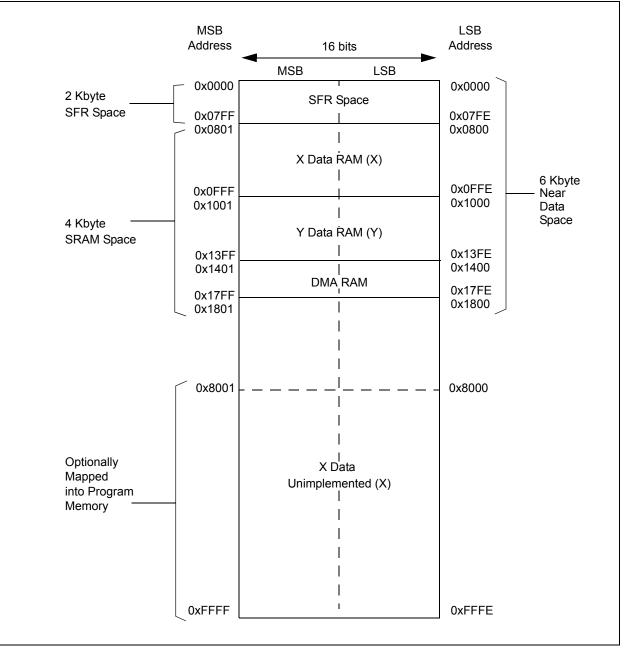

FIGURE 4-4: DATA MEMORY MAP FOR dsPIC33FJ128GP202/204 AND dsPIC33FJ64GP202/ 204 DEVICES WITH 8 KB RAM

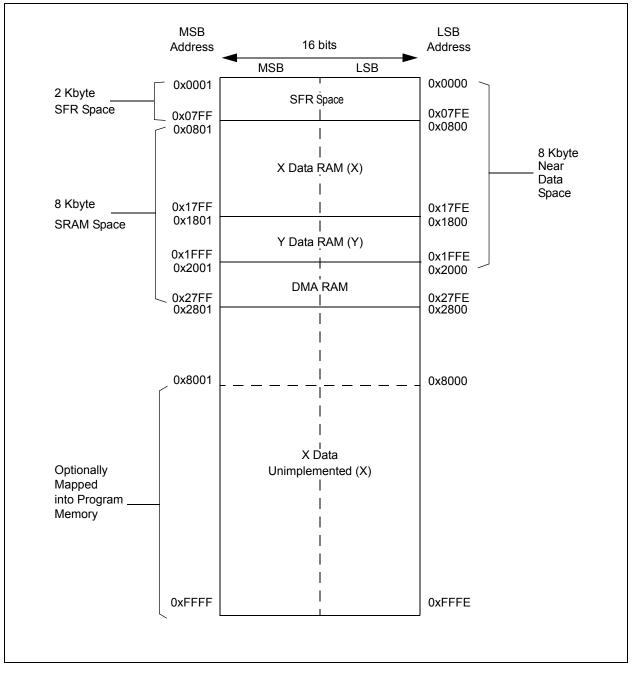

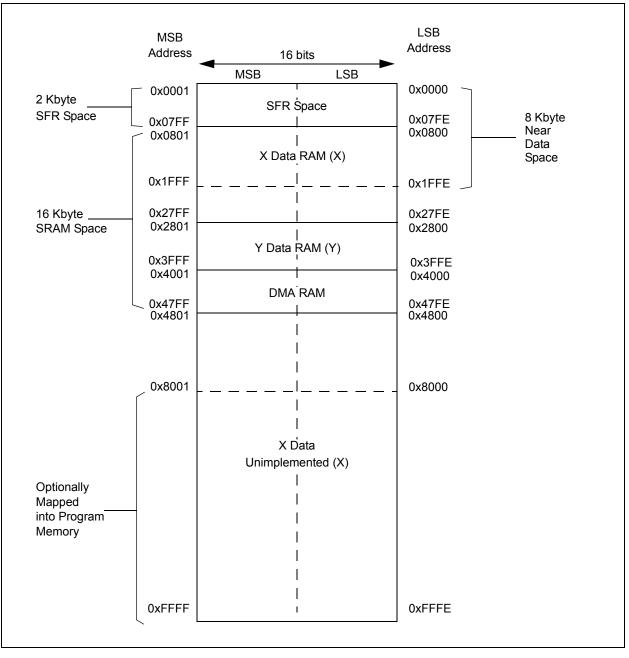

FIGURE 4-5: DATA MEMORY MAP FOR dsPIC33FJ128GP802/804 AND dsPIC33FJ64GP802/ 804 DEVICES WITH 16 KB RAM

4.2.5 X AND Y DATA SPACES

The core has two data spaces, X and Y. These data spaces can be considered either separate (for some DSP instructions), or as one unified linear address range (for MCU instructions). The data spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X data space is used by all instructions and supports all addressing modes. X data space has separate read and write data buses. The X read data bus is the read data path for all instructions that view data space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y data space is used in concert with the X data space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y data spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X data space.

All data memory writes, including in DSP instructions, view data space as combined X and Y address space. The boundary between the X and Y data spaces is device-dependent and is not user-programmable.

All effective addresses are 16 bits wide and point to bytes within the data space. Therefore, the data space address range is 64 Kbytes, or 32K words, though the implemented memory locations vary by device.

4.2.6 DMA RAM

Every dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 device contains up to 2 Kbytes of dual ported DMA RAM located at the end of Y data space, and is part of Y data space. Memory locations in the DMA RAM space are accessible simultaneously by the CPU and the DMA controller module. DMA RAM is utilized by the DMA controller to store data to be transferred to various peripherals using DMA, as well as data transferred from various peripherals using DMA. The DMA RAM can be accessed by the DMA controller without having to steal cycles from the CPU.

When the CPU and the DMA controller attempt to concurrently write to the same DMA RAM location, the hardware ensures that the CPU is given precedence in accessing the DMA RAM location. Therefore, the DMA RAM provides a reliable means of transferring DMA data without ever having to stall the CPU.

| Note: | DMA | RAM | can | be | used | for | general |

4.4.1 SOFTWARE STACK

In addition to its use as a working register, the W15 register in the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices is also used as a software Stack Pointer. The Stack Pointer always points to the first available free word and grows from lower to higher addresses. It pre-decrements for stack pops and post-increments for stack pushes, as shown in Figure 4-6. For a PC push during any CALL instruction, the MSb of the PC is zero-extended before the push, ensuring that the MSb is always clear.

Note: A PC push during exception processing concatenates the SRL register to the MSb of the PC prior to the push.

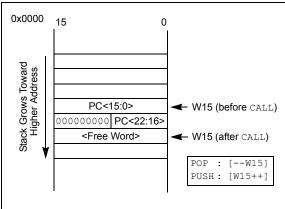

The Stack Pointer Limit register (SPLIM) associated with the Stack Pointer sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' because all stack operations must be word aligned.

Whenever an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal and a push operation is performed, a stack error trap does not occur. The stack error trap occurs on a subsequent push operation. For example, to cause a stack error trap when the stack grows beyond address 0x2000 in RAM, initialize the SPLIM with the value 0x1FFE.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0x0800. This prevents the stack from interfering with the Special Function Register (SFR) space.

A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 4-6: CALL STACK FRAME

4.4.2 DATA RAM PROTECTION FEATURE

The dsPIC33F product family supports Data RAM protection features that enable segments of RAM to be protected when used in conjunction with Boot and Secure Code Segment Security. BSRAM (Secure RAM segment for BS) is accessible only from the Boot Segment Flash code when enabled. SSRAM (Secure RAM segment for RAM) is accessible only from the Secure Segment Flash code when enabled. See Table 4-1 for an overview of the BSRAM and SSRAM SFRs.

4.5 Instruction Addressing Modes

The addressing modes shown in Table 4-37 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

4.5.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (near data space). Most file register instructions employ a working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire data space.

4.5.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 <function> Operand 2 where:

Operand 1 is always a working register (that is, the addressing mode can only be register direct), which is referred to as Wb.

Operand 2 can be a W register, fetched from data memory, or a 5-bit literal. The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- · Register Indirect
- · Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-bit or 10-bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

| Addressing Mode | Description |
|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| File Register Direct | The address of the file register is specified explicitly. |
| Register Direct | The contents of a register are accessed directly. |
| Register Indirect | The contents of Wn forms the Effective Address (EA). |
| Register Indirect Post-Modified | The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value. |
| Register Indirect Pre-Modified | Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA. |
| Register Indirect with Register Offset (Register Indexed) | The sum of Wn and Wb forms the EA. |
| Register Indirect with Literal Offset | The sum of Wn and a literal forms the EA. |

TABLE 4-37: FUNDAMENTAL ADDRESSING MODES SUPPORTED

4.5.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

| Note: | For the MOV instructions, the addressing mode specified in the instruction can differ |
|-------|---------------------------------------------------------------------------------------|
| | for the source and destination EA. |
| | However, the 4-bit Wb (Register Offset) |
| | field is shared by both source and |
| | destination (but typically only used by |
| | one). |

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-bit Literal
- 16-bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.5.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY. N, MOVSAC and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the data pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The effective addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

| Note: | Register | Indirect | with | Register | Offset |
|-------|------------|-----------|---------|-------------|--------|
| | Addressir | ng mode i | is ava | ilable only | for W9 |
| | (in X spac | ce) and W | /11 (in | Y space). | |

In summary, the following addressing modes are supported by the ${\tt MAC}$ class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- · Register Indirect Post-Modified by 4
- · Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.5.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ADD Acc, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

4.6 Modulo Addressing

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either data or program space (since the data pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into program space) and Y data spaces. Modulo Addressing can operate on any W register pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction as there are certain restrictions on the buffer start address (for incrementing buffers), or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

4.6.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-1).

Note: Y space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.6.2 W ADDRESS REGISTER SELECTION

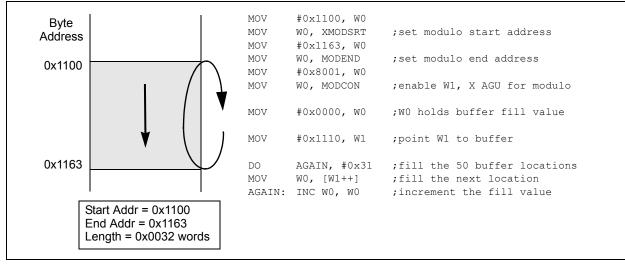

The Modulo and Bit-Reversed Addressing Control register, MODCON<15:0>, contains enable flags as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

- If XWM = 15, X RAGU and X WAGU Modulo Addressing is disabled.
- If YWM = 15, Y AGU Modulo Addressing is disabled.

The X Address Space Pointer W register (XWM), to which Modulo Addressing is to be applied, is stored in MODCON<3:0> (see Table 4-1). Modulo Addressing is enabled for X data space when XWM is set to any value other than '15' and the XMODEN bit is set at MODCON<15>.

The Y Address Space Pointer W register (YWM) to which Modulo Addressing is to be applied is stored in MODCON<7:4>. Modulo Addressing is enabled for Y data space when YWM is set to any value other than '15' and the YMODEN bit is set at MODCON<14>.

FIGURE 4-7: MODULO ADDRESSING OPERATION EXAMPLE

4.6.3 MODULO ADDRESSING APPLICABILITY

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register. Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries check for addresses less than or greater than the upper (for incrementing buffers) and lower (for decrementing buffers) boundary addresses (not just equal to). Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

Note: The modulo corrected effective address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the effective address. When an address offset (such as [W7 + W2]) is used, Modulo Address correction is performed but the contents of the register remain unchanged.

4.7 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.7.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWM bits (W register selection) in the MODCON register are any value other than '15' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last 'N' bits of the data buffer start address must be zeros.

XB<14:0> is the Bit-Reversed Address modifier, or 'pivot point,' which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data, and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB), and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data is a requirement, the LSb of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing should not be enabled together. If an application attempts to do so, Bit-Reversed Addressing assumes priority when active for the X WAGU and X WAGU, Modulo Addressing is disabled. However, Modulo Addressing continues to function in the X RAGU.

If Bit-Reversed Addressing has already been enabled by setting the BREN bit (XBREV<15>), a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the bit-reversed pointer.

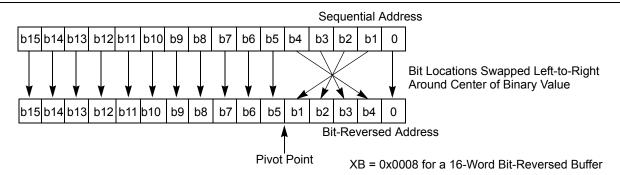

TABLE 4-38: BIT-REVERSED ADDRESS SEQUENCE (16-ENTRY)

| | | Norma | al Addres | SS | | | Bit-Rev | ersed Ac | Idress |

4.8 Interfacing Program and Data Memory Spaces

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 architecture uses a 24 bit wide program space and a 16 bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 architecture provides two methods by which program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look-ups from a large table of static data. The application can only access the least significant word of the program word.

4.8.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Page register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

For remapping operations, the 8-bit Program Space Visibility register (PSVPAG) is used to define a 16K word page in the program space. When the Most Significant bit of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike table operations, this limits remapping operations strictly to the user memory area.

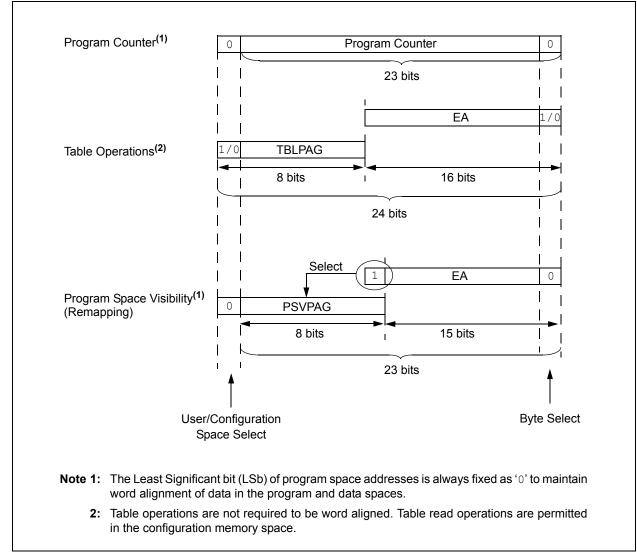

Table 4-39 and Figure 4-9 show how the program EA is created for table operations and remapping accesses from the data EA. Here, P<23:0> refers to a program space word, and D<15:0> refers to a data space word.

TABLE 4-39: PROGRAM SPACE ADDRESS CONSTRUCTION

| | Access | Program Space Address | | | | | | | | |
|--------------------------|---------------|------------------------------|-----------|-----------------------------------|------------------|-----|--|--|--|--|
| Access Type | Space | <23> | <22:16> | <15> | <14:1> | <0> | | | | |
| Instruction Access | User | 0 | | PC<22:1> | | 0 | | | | |
| (Code Execution) | | 0xx xxxx xxxx xxxx xxxx xxx0 | | | | | | | | |
| TBLRD/TBLWT | User | TB | LPAG<7:0> | | Data EA<15:0> | | | | | |
| (Byte/Word Read/Write) | | 0 | XXX XXXX | XXXX XX | x xxxx xxxx xxxx | | | | | |
| | Configuration | TB | LPAG<7:0> | Data EA<15:0> | | | | | | |
| | | 1 | XXX XXXX | XXXX XXXX XXXX XXXX | | | | | | |
| Program Space Visibility | User | 0 | PSVPAG<7 | 7:0> Data EA<14:0> ⁽¹⁾ | | | | | | |
| (Block Remap/Read) | | 0 | XXXX XXXX | XXX XXXX XXXX XXX | | | | | | |

Note 1: Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

4.8.2 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program space without going through data space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper 8 bits of a program space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit-wide word address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space that contains the least significant data word. TBLRDH and TBLWTH access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

- TBLRDL (Table Read Low):
 - In Word mode, this instruction maps the lower word of the program space location (P<15:0>) to a data address (D<15:0>).

- In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.
- TBLRDH (Table Read High):
 - In Word mode, this instruction maps the entire upper word of a program address (P<23:16>) to a data address. The 'phantom' byte (D<15:8>), is always '0'.
 - In Byte mode, this instruction maps the upper or lower byte of the program word to D<7:0> of the data address, in the TBLRDL instruction. The data is always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in Section 5.0 "Flash Program Memory".

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user application and configuration spaces. When TBLPAG<7> = 0, the table page is located in the user memory space. When TBLPAG<7> = 1, the page is located in configuration space.

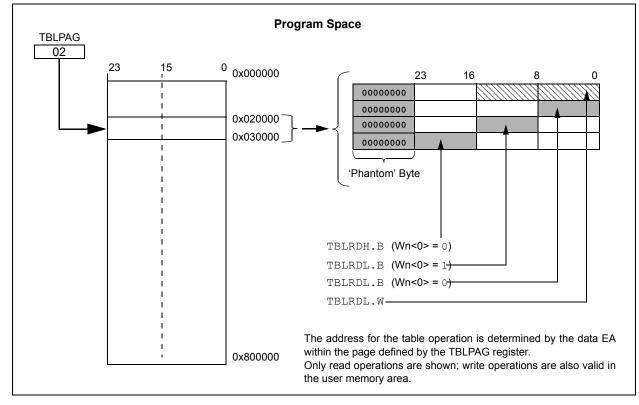

FIGURE 4-10: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

4.8.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access to stored constant data from the data space without the need to use special instructions (such as TBLRDL/H).

Program space access through the data space occurs if the Most Significant bit of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (CORCON<2>). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add a cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address 0x8000 and higher maps directly into a corresponding program memory address (see Figure 4-11), only the lower 16 bits of the

24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

Note: PSV access is temporarily disabled during table reads/writes.

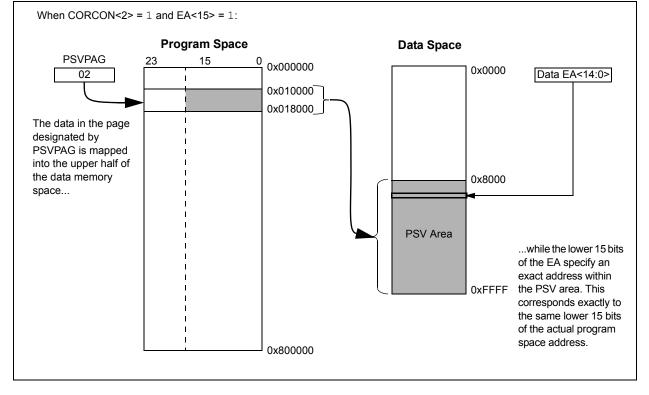

For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV, and are executed inside a REPEAT loop, these instances require two instruction cycles in addition to the specified execution time of the instruction:

- · Execution in the first iteration
- · Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop allows the instruction using PSV to access data, to execute in a single cycle.

NOTES:

5.0 FLASH PROGRAM MEMORY

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304 dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 5. "Flash Programming" (DS70191) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming[™] (ICSP[™]) programming capability
- Run-Time Self-Programming (RTSP)

ICSP allows any of the following devices, dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04, to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (one of the alternate programming pin pairs: PGECx/PGEDx), and three other lines for power (VDD), ground (Vss) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (table read) and TBLWT (table write) instructions. With RTSP, the user application can write program memory data either in blocks or 'rows' of 64 instructions (192 bytes) at a time or a single program memory word, and erase program memory in blocks or 'pages' of 512 instructions (1536 bytes) at a time.

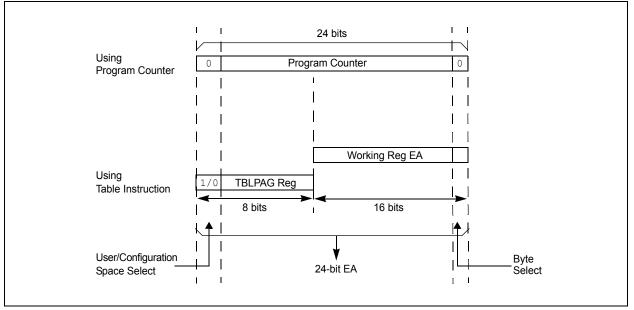

5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the table read and table write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits <7:0> of the TBLPAG register and the Effective Address (EA) from a W register specified in the table instruction, as shown in Figure 5-1.

The TBLRDL and the TBLWTL instructions are used to read or write to bits <15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits <23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

5.2 RTSP Operation

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of memory, which consists of eight rows (512 instructions) at a time, and to program one row or one word at a time. Table 30-12 shows typical erase and programming times. The 8-row erase pages and single row write rows are edge-aligned from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively.

The program memory implements holding buffers that can contain 64 instructions of programming data. Prior to the actual programming operation, the write data must be loaded into the buffers sequentially. The instruction words loaded must always be from a group of 64 boundary.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of TBLWT instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register. A total of 64 TBLWTL and TBLWTH instructions are required to load the instructions.

All of the table write operations are single-word writes (two instruction cycles) because only the buffers are written. A programming cycle is required for programming each row.

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

The programming time depends on the FRC accuracy (see Table 30-19) and the value of the FRC Oscillator Tuning register (see Register 9-4). Use the formula in Equation 5-1 to calculate the minimum and maximum values for the Row Write Time, Page Erase Time and Word Write Cycle Time parameters (see Table 30-12).

EQUATION 5-1: PROGRAMMING TIME

For example, if the device is operating at +125°C, the FRC accuracy will be $\pm 5\%$. If the TUN<5:0> bits (see Register 9-4) are set to `b111111, the minimum row write time is equal to Equation 5-2.

EQUATION 5-2: MINIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \ Cycles}{7.37 \ MHz \times (1 + 0.05) \times (1 - 0.00375)} = 1.435 \ ms$$

The maximum row write time is equal to Equation 5-3.

$$T_{RW} = \frac{11064 \ Cycles}{7.37 \ MHz \times (1 - 0.05) \times (1 - 0.00375)} = 1.586 ms$$

Setting the WR bit (NVMCON<15>) starts the operation, and the WR bit is automatically cleared when the operation is finished.

5.4 Control Registers

Two SFRs are used to read and write the program Flash memory: NVMCON and NVMKEY.

The NVMCON register (Register 5-1) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY (Register 5-2) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register. Refer to **Section 5.3 "Programming Operations"** for further details.

5.5 Flash Resources

Many useful resources related to Flash memory are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

5.6.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program one row of program Flash memory at a time. To do this, it is necessary to erase the 8-row erase page that contains the desired row. The general process is:

- 1. Read eight rows of program memory (512 instructions) and store in data RAM.
- 2. Update the program data in RAM with the desired new data.
- 3. Erase the block (see Example 5-1):
 - a) Set the NVMOP bits (NVMCON<3:0>) to ⁽⁰⁰¹⁰⁾ to configure for block erase. Set the ERASE (NVMCON<6>) and WREN (NVMCON<14>) bits.
 - b) Write the starting address of the page to be erased into the TBLPAG and W registers.
 - c) Write 0x55 to NVMKEY.
 - d) Write 0xAA to NVMKEY.
 - e) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.

- 4. Write the first 64 instructions from data RAM into the program memory buffers (see Example 5-2).
- 5. Write the program block to Flash memory:
 - a) Set the NVMOP bits to '0001' to configure for row programming. Clear the ERASE bit and set the WREN bit.
 - b) Write 0x55 to NVMKEY.
 - c) Write 0xAA to NVMKEY.
 - d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.
- Repeat steps 4 and 5, using the next available 64 instructions from the block in data RAM by incrementing the value in TBLPAG, until all 512 instructions are written back to Flash memory.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPS, as shown in Example 5-3.

6.0 RESETS

- Note 1: This data sheet summarizes the features dsPIC33FJ32GP302/304. of the dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 8. "Reset" (DS70192) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Reset module combines all reset sources and controls the device Master Reset Signal, SYSRST. The following is a list of device Reset sources:

- POR: Power-on Reset
- · BOR: Brown-out Reset
- MCLR: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
 - Illegal Opcode Reset
 - Uninitialized W Register Reset
 - Security Reset

FIGURE 6-1: RESET SYSTEM BLOCK DIAGRAM

A simplified block diagram of the Reset module is shown in Figure 6-1.

Any active source of reset will make the SYSRST signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

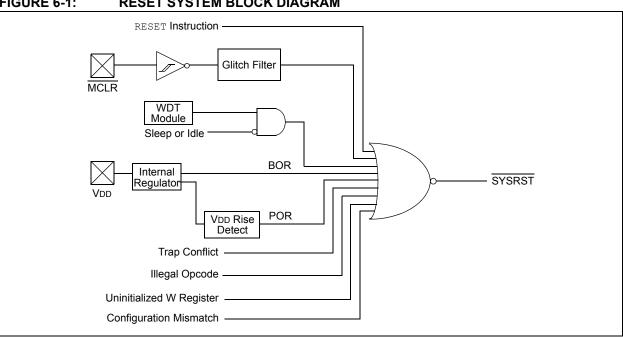

Note: Refer to the specific peripheral section or Section 3.0 "CPU" of this manual for register Reset states.

All types of device Reset sets a corresponding status bit in the RCON register to indicate the type of Reset (see Register 6-1).

A POR clears all the bits, except for the POR bit (RCON<0>), that are set. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

The status bits in the RCON register Note: should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

6.1 Reset Resources

Many useful resources related to Resets are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾

If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾ (CONTINUED)

- bit 1
 BOR: Brown-out Reset Flag bit

 1 = A Brown-out Reset has occurred

 0 = A Brown-out Reset has not occurred

 bit 0
 POR: Power-on Reset Flag bit

 1 = A Power-on Reset has occurred
 - 0 = A Power-on Reset has not occurred
- **Note 1:** All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.
 - 2: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

6.3 System Reset

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 family of devices have two types of Reset:

- Cold Reset
- Warm Reset

A cold Reset is the result of a Power-on Reset (POR) or a Brown-out Reset (BOR). On a cold Reset, the FNOSC configuration bits in the FOSC device configuration register selects the device clock source. A warm Reset is the result of all other reset sources, including the RESET instruction. On warm Reset, the device will continue to operate from the current clock source as indicated by the Current Oscillator Selection bits (COSC<2:0>) in the Oscillator Control register (OSCCON<14:12>).

The device is kept in a Reset state until the system power supplies have stabilized at appropriate levels and the oscillator clock is ready. The sequence in which this occurs is shown in Figure 6-2.

| Oscillator Mode | Oscillator Startup Delay | Oscillator Startup Timer | PLL Lock Time | Total Delay |
|---------------------------|-----------------------------|-----------------------------|---------------|----------------------|
| FRC, FRCDIV16, FRCDIVN | Toscd | _ | _ | Toscd |
| FRCPLL | Toscd | — | TLOCK | TOSCD + TLOCK |
| XT | Toscd | Tost | — | TOSCD + TOST |
| HS | Toscd | Tost | — | TOSCD + TOST |
| EC | — | — | — | — |
| XTPLL | Toscd | Tost | TLOCK | TOSCD + TOST + TLOCK |
| HSPLL | Toscd | Tost | TLOCK | TOSCD + TOST + TLOCK |
| ECPLL | — | — | TLOCK | TLOCK |
| SOSC | Toscd | Tost | _ | TOSCD + TOST |
| LPRC | Toscd | — | _ | Toscd |

| TABLE 6-1: OSCILLATOR DELAY |
|-----------------------------|
|-----------------------------|

Note 1: ToscD = Oscillator Start-up Delay (1.1 μs max for FRC, 70 μs max for LPRC). Crystal Oscillator start-up times vary with crystal characteristics, load capacitance, etc.

2: TOST = Oscillator Start-up Timer Delay (1024 oscillator clock period). For example, TOST = 102.4 μs for a 10 MHz crystal and TOST = 32 ms for a 32 kHz crystal.

3: TLOCK = PLL lock time (1.5 ms nominal), if PLL is enabled.

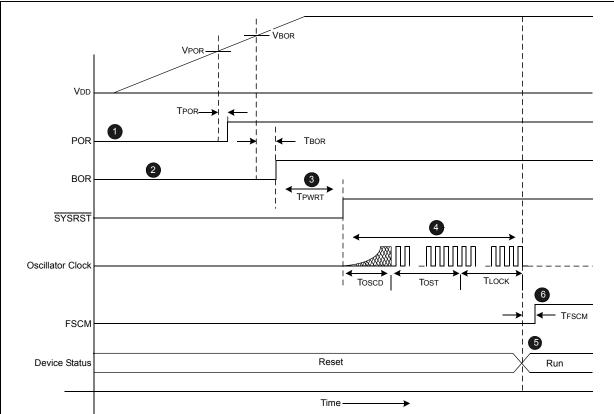

FIGURE 6-2: SYSTEM RESET TIMING

- **Note 1: POR:** A POR circuit holds the device in Reset when the power supply is turned on. The POR circuit is active until VDD crosses the VPOR threshold and the delay TPOR has elapsed.
 - 2: BOR: The on-chip voltage regulator has a BOR circuit that keeps the device in Reset until VDD crosses the VBOR threshold and the delay TBOR has elapsed. The delay TBOR ensures the voltage regulator output becomes stable.
 - **3: PWRT Timer:** The programmable power-up timer continues to hold the processor in Reset for a specific period of time (TPWRT) after a BOR. The delay TPWRT ensures that the system power supplies have stabilized at the appropriate level for full-speed operation. After the delay TPWRT has elapsed, the SYSRST becomes inactive, which in turn enables the selected oscillator to start generating clock cycles.
 - 4: Oscillator Delay: The total delay for the clock to be ready for various clock source selections are given in Table 6-1. Refer to Section 9.0 "Oscillator Configuration" for more information.
 - **5:** When the oscillator clock is ready, the processor begins execution from location 0x000000. The user application programs a GOTO instruction at the reset address, which redirects program execution to the appropriate start-up routine.
 - 6: The Fail-Safe Clock Monitor (FSCM), if enabled, begins to monitor the system clock when the system clock is ready and the delay TFSCM elapsed.

| Symbol | Parameter | Value |
|--------|----------------------------------|------------------|
| VPOR | POR threshold | 1.8V nominal |
| TPOR | POR extension time | 30 μs maximum |
| VBOR | BOR threshold | 2.5V nominal |
| TBOR | BOR extension time | 100 μs maximum |
| TPWRT | Programmable power-up time delay | 0-128 ms nominal |
| TFSCM | Fail-Safe Clock Monitor Delay | 900 μs maximum |

When the device exits the Reset condi-Note: tion (begins normal operation), the device operating parameters (voltage, frequency, temperature, etc.) must be within their operating ranges, otherwise the device may not function correctly. The user application must ensure that the delay between the time power is first applied, and the time SYSRST becomes inactive, is long enough to get all operating parameters within specification.

6.4 **Power-on Reset (POR)**

A Power-on Reset (POR) circuit ensures the device is reset from power-on. The POR circuit is active until VDD crosses the VPOR threshold and the delay TPOR has elapsed. The delay TPOR ensures the internal device bias circuits become stable.

The device supply voltage characteristics must meet the specified starting voltage and rise rate requirements to generate the POR. Refer to Section 30.0 "Electrical Characteristics" for details.

The POR status bit (POR) in the Reset Control register (RCON<0>) is set to indicate the Power-on Reset.

6.4.1 Brown-out Reset (BOR) and Power-up timer (PWRT)

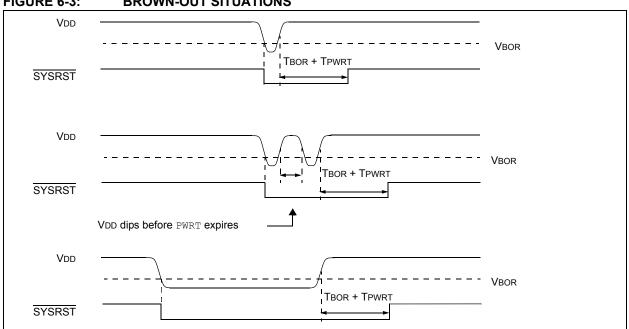

The on-chip regulator has a Brown-out Reset (BOR) circuit that resets the device when the VDD is too low (VDD < VBOR) for proper device operation. The BOR circuit keeps the device in Reset until VDD crosses VBOR threshold and the delay TBOR has elapsed. The delay TBOR ensures the voltage regulator output becomes stable.

The BOR status bit (BOR) in the Reset Control register (RCON<1>) is set to indicate the Brown-out Reset.

The device will not run at full speed after a BOR as the VDD should rise to acceptable levels for full-speed operation. The PWRT provides power-up time delay (TPWRT) to ensure that the system power supplies have stabilized at the appropriate levels for full-speed operation before the SYSRST is released.

The power-up timer delay (TPWRT) is programmed by the Power-on Reset Timer Value Select bits (FPWRT<2:0>) in the POR Configuration register (FPOR<2:0>), which provides eight settings (from 0 ms to 128 ms). Refer to **Section 27.0 "Special Features"** for further details.

Figure 6-3 shows the typical brown-out scenarios. The reset delay (TBOR + TPWRT) is initiated each time VDD rises above the VBOR trip point

External Reset (EXTR) 6.5

The external Reset is generated by driving the MCLR pin low. The MCLR pin is a Schmitt trigger input with an additional glitch filter. Reset pulses that are longer than the minimum pulse-width will generate a Reset. Refer to Section 30.0 "Electrical Characteristics" for minimum pulse-width specifications. The External Reset (MCLR) Pin (EXTR) bit in the Reset Control register (RCON) is set to indicate the MCLR Reset.

6.5.0.1 EXTERNAL SUPERVISORY CIRCUIT

Many systems have external supervisory circuits that generate reset signals to Reset multiple devices in the system. This external Reset signal can be directly connected to the MCLR pin to Reset the device when the rest of system is Reset.

6.5.0.2 INTERNAL SUPERVISORY CIRCUIT

When using the internal power supervisory circuit to Reset the device, the external reset pin (MCLR) should be tied directly or resistively to VDD. In this case, the MCLR pin will not be used to generate a Reset. The external reset pin (MCLR) does not have an internal pull-up and must not be left unconnected.

6.6 Software RESET Instruction (SWR)

Whenever the RESET instruction is executed, the device will assert SYSRST, placing the device in a special Reset state. This Reset state will not reinitialize the clock. The clock source in effect prior to the RESET instruction will remain. SYSRST is released at the next instruction cycle, and the reset vector fetch will commence.

The Software Reset (Instruction) Flag (SWR) bit in the Reset Control (RCON<6>) register is set to indicate the software Reset.

6.7 Watchdog Time-out Reset (WDTO)

Whenever a Watchdog time-out occurs, the device will asynchronously assert SYSRST. The clock source will remain unchanged. A WDT time-out during Sleep or Idle mode will wake-up the processor, but will not reset the processor.

The Watchdog Timer Time-out Flag (WDTO) bit in the Reset Control register (RCON<4>) is set to indicate the Watchdog Reset. Refer to Section 27.4 "Watchdog Timer (WDT)" for more information on Watchdog Reset.

6.8 Trap Conflict Reset

If a lower-priority hard trap occurs while a higher-priority trap is being processed, a hard trap conflict Reset occurs. The hard traps include exceptions of priority level 13 through level 15, inclusive. The address error (level 13) and oscillator error (level 14) traps fall into this category.

The Trap Reset Flag (TRAPR) bit in the Reset Control register (RCON<15>) is set to indicate the Trap Conflict Reset. Refer to Section 7.0 "Interrupt Controller" for more information on trap conflict Resets.

6.9 Configuration Mismatch Reset

To maintain the integrity of the peripheral pin select control registers, they are constantly monitored with shadow registers in hardware. If an unexpected change in any of the registers occur (such as cell disturbances caused by ESD or other external events), a configuration mismatch Reset occurs.

The Configuration Mismatch Flag (CM) bit in the Reset Control register (RCON<9>) is set to indicate the configuration mismatch Reset. Refer to Section 11.0 "I/O Ports" for more information on the configuration mismatch Reset.

Note: The configuration mismatch feature and associated reset flag is not available on all devices.

6.10 Illegal Condition Device Reset

An illegal condition device Reset occurs due to the following sources:

- Illegal Opcode Reset
- Uninitialized W Register Reset
- · Security Reset

The Illegal Opcode or Uninitialized W Access Reset Flag (IOPUWR) bit in the Reset Control register (RCON<14>) is set to indicate the illegal condition device Reset.

6.10.1 ILLEGAL OPCODE RESET

A device Reset is generated if the device attempts to execute an illegal opcode value that is fetched from program memory.

The illegal opcode Reset function can prevent the device from executing program memory sections that are used to store constant data. To take advantage of the illegal opcode Reset, use only the lower 16 bits of

each program memory section to store the data values. The upper 8 bits should be programmed with 0x3F, which is an illegal opcode value.

6.10.2 UNINITIALIZED W REGISTER RESET

Any attempts to use the uninitialized W register as an address pointer will Reset the device. The W register array (with the exception of W15) is cleared during all resets and is considered uninitialized until written to.

6.10.3 SECURITY RESET

If a Program Flow Change (PFC) or Vector Flow Change (VFC) targets a restricted location in a protected segment (Boot and Secure Segment), that operation will cause a security Reset.

The PFC occurs when the Program Counter is reloaded as a result of a Call, Jump, Computed Jump, Return, Return from Subroutine, or other form of branch instruction.

The VFC occurs when the Program Counter is reloaded with an Interrupt or Trap vector.

Refer to Section 27.8 "Code Protection and CodeGuard™ Security" for more information on Security Reset.

6.11 Using the RCON Status Bits

The user application can read the Reset Control register (RCON) after any device Reset to determine the cause of the reset.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

Table 6-3 provides a summary of the reset flag bit operation.

| Flag Bit | Set by: | Cleared by: |
|------------------|------------------------------------------------------------------------|-----------------------------------------------------|
| TRAPR (RCON<15>) | Trap conflict event | POR, BOR |
| IOPWR (RCON<14>) | Illegal opcode or uninitialized W register access or Security Reset | POR, BOR |
| CM (RCON<9>) | Configuration Mismatch | POR, BOR |
| EXTR (RCON<7>) | MCLR Reset | POR |
| SWR (RCON<6>) | RESET instruction | POR, BOR |
| WDTO (RCON<4>) | WDT time-out | PWRSAV instruction, CLRWDT instruction, POR, BOR |
| SLEEP (RCON<3>) | PWRSAV #SLEEP instruction | POR, BOR |
| IDLE (RCON<2>) | PWRSAV #IDLE instruction | POR, BOR |
| BOR (RCON<1>) | POR, BOR | _ |
| POR (RCON<0>) | POR | _ |

Note: All Reset flag bits can be set or cleared by user software.

TABLE 6-3: RESET FLAG BIT OPERATION

NOTES:

7.0 INTERRUPT CONTROLLER

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 32. "Interrupts (Part III)" (DS70214) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 CPU.

The interrupt controller has the following features:

- Up to eight processor exceptions and software traps
- Eight user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- · Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- Fixed interrupt entry and return latencies

7.1 Interrupt Vector Table

The Interrupt Vector Table (IVT), shown in Figure 7-1, resides in program memory, starting at location 000004h. The IVT contains 126 vectors consisting of eight nonmaskable trap vectors plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with vector 0 takes priority over interrupts at any other vector address.

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices implement up to 53 unique interrupts and five nonmaskable traps. These are summarized in Table 7-1.

7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 7-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 device clears its registers in response to a Reset, which forces the PC to zero. The digital signal controller then begins program execution at location 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

TABLE 7-1: INTERRUPT VECTORS (CONTINUED)

7.3 Interrupt Control and Status Registers

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices implement a total of 30 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFSx
- IECx
- IPCx
- INTTREG

7.3.1 INTCON1 AND INTCON2

Global interrupt control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable bit (NSTDIS) as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table.

7.3.2 IFSx

The IFS registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

7.3.3 IECx

The IEC registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.3.4 IPCx

The IPC registers are used to set the interrupt priority level for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

7.3.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU interrupt priority level, which are latched into vector number (VECNUM<6:0>) and Interrupt level bits (ILR<3:0>) in the INTTREG register. The new interrupt priority level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence that they are listed in Table 7-1. For example, the INT0 (External Interrupt 0) is shown as having vector number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0<0>, the INT0IE bit in IEC0<0>, and the INT0IP bits in the first position of IPC0 (IPC0<2:0>).

7.3.6 STATUS/CONTROL REGISTERS

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality.

- The CPU STATUS register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU interrupt priority level. The user software can change the current CPU priority level by writing to the IPL bits.
- The CORCON register contains the IPL3 bit which, together with IPL<2:0>, also indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in Register 7-1 through Register 7-31.

7.4 Interrupts Resources

Many useful resources related to Interrupts are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

| Note: | In the event you are not able to access the |

|-------|---------------------------|-------|-----|-------|-------|-------|-------|
| | IPL<2:0> ^(2,3) | | RA | N | OV | Z | С |
| bit 7 | | | | | | | bit 0 |

| Legend: | | | |
|--------------------|----------------------|------------------------------------|--|
| C = Clear only bit | R = Readable bit | U = Unimplemented bit, read as '0' | |
| S = Set only bit | W = Writable bit | -n = Value at POR | |
| '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown | |

bit 7-5 IPL<2:0>: CPU Interrupt Priority Level Status bits⁽²⁾

111 = CPU Interrupt Priority Level is 7 (15), user interrupts are disabled

- 110 = CPU Interrupt Priority Level is 6 (14)
- 101 = CPU Interrupt Priority Level is 5 (13)
- 100 = CPU Interrupt Priority Level is 4 (12)
- 011 = CPU Interrupt Priority Level is 3 (11)
- 010 = CPU Interrupt Priority Level is 2 (10)
- 001 = CPU Interrupt Priority Level is 1 (9)
- 000 = CPU Interrupt Priority Level is 0 (8)

Note 1: For complete register details, see Register 3-1.

- 2: The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.
- 3: The IPL<2:0> Status bits are read-only when the NSTDIS bit (INTCON1<15>) = 1.

7.6 Interrupt Setup Procedures

7.6.1 INITIALIZATION

To configure an interrupt source at initialization:

- 1. Set the NSTDIS bit (INTCON1<15>) if nested interrupts are not desired.
- Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level depends on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources can be programmed to the same non-zero value.

Note: At a device Reset, the IPCx registers are initialized such that all user interrupt sources are assigned to priority level 4.

- 3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
- 4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

7.6.2 INTERRUPT SERVICE ROUTINE

The method used to declare an ISR and initialize the IVT with the correct vector address depends on the programming language (C or assembler) and the language development tool suite used to develop the application.

In general, the user application must clear the interrupt flag in the appropriate IFSx register for the source of interrupt that the ISR handles. Otherwise, the program re-enters the ISR immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a RETFIE instruction to unstack the saved PC value, SRL value and old CPU priority level.

7.6.3 TRAP SERVICE ROUTINE

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

7.6.4 INTERRUPT DISABLE

All user interrupts can be disabled using this procedure:

- 1. Push the current SR value onto the software stack using the PUSH instruction.
- 2. Force the CPU to priority level 7 by inclusive ORing the value OEh with SRL.

To enable user interrupts, the POP instruction can be used to restore the previous SR value.

| Note: | Only user interrupts with a priority level of |
|-------|-----------------------------------------------|
| | 7 or lower can be disabled. Trap sources |
| | (level 8-level 15) cannot be disabled. |

The DISI instruction provides a convenient way to disable interrupts of priority levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the DISI instruction.

NOTES:

8.0 DIRECT MEMORY ACCESS (DMA)

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 38. "Direct Memory Access (DMA) (Part III)" (DS70215) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

Direct Memory Access (DMA) is a very efficient mechanism of copying data between peripheral SFRs (e.g., UART Receive register, Input Capture 1 buffer), and buffers or variables stored in RAM, with minimal CPU intervention. The DMA controller can automatically copy entire blocks of data without requiring the user software to read or write the peripheral Special Function Registers (SFRs) every time a peripheral interrupt occurs. The DMA controller uses a dedicated bus for data transfers and therefore, does not steal cycles from the code execution flow of the CPU. To exploit the DMA capability, the corresponding user buffers or variables must be located in DMA RAM.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 peripherals that can utilize DMA are listed in Table 8-1.

TABLE 8-1: DMA CHANNEL TO PERIPHERAL ASSOCIATIONS

The DMA controller features eight identical data transfer channels.

Each channel has its own set of control and status registers. Each DMA channel can be configured to copy data either from buffers stored in dual port DMA RAM to peripheral SFRs, or from peripheral SFRs to buffers in DMA RAM.

The DMA controller supports the following features:

- Eight DMA channels
- Register Indirect With Post-increment Addressing mode
- Register Indirect Without Post-increment Addressing mode
- Peripheral Indirect Addressing mode (peripheral generates destination address)
- CPU interrupt after half or full block transfer complete

- · Byte or word transfers
- · Fixed priority channel arbitration
- Manual (software) or Automatic (peripheral DMA requests) transfer initiation
- One-Shot or Auto-Repeat block transfer modes
- Ping-Pong mode (automatic switch between two DPSRAM start addresses after each block transfer complete)
- DMA request for each channel can be selected from any supported interrupt source
- · Debug support features

For each DMA channel, a DMA interrupt request is generated when a block transfer is complete. Alternatively, an interrupt can be generated when half of the block has been filled.

8.2 DMAC Registers

Each DMAC Channel x (x = 0, 1, 2, 3, 4, 5, 6 or 7) contains the following registers:

- A 16-bit DMA Channel Control register (DMAxCON)
- A 16-bit DMA Channel IRQ Select register (DMAxREQ)
- A 16-bit DMA RAM Primary Start Address register (DMAxSTA)
- A 16-bit DMA RAM Secondary Start Address register (DMAxSTB)
- A 16-bit DMA Peripheral Address register (DMAxPAD)
- A 10-bit DMA Transfer Count register (DMAxCNT)

An additional pair of status registers, DMACS0 and DMACS1, are common to all DMAC channels. DMACS0 contains the DMA RAM and SFR write collision flags, XWCOLx and PWCOLx, respectively. DMACS1 indicates DMA channel and Ping-Pong mode status.

The DMAxCON, DMAxREQ, DMAxPAD and DMAxCNT are all conventional read/write registers. Reads of DMAxSTA or DMAxSTB reads the contents of the DMA RAM Address register. Writes to DMAx-STA or DMAxSTB write to the registers. This allows the user to determine the DMA buffer pointer value (address) at any time.

The interrupt flags (DMAxIF) are located in an IFSx register in the interrupt controller. The corresponding interrupt enable control bits (DMAxIE) are located in an IECx register in the interrupt controller, and the corresponding interrupt priority control bits (DMAxIP) are located in an IPCx register in the interrupt controller.

NOTES:

9.0 OSCILLATOR CONFIGURATION

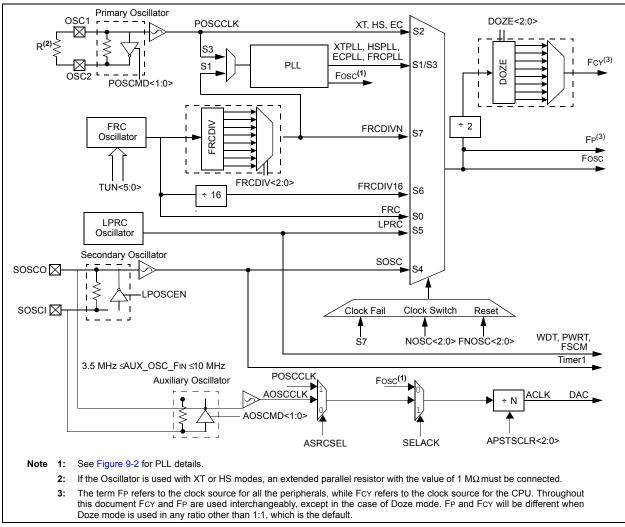

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304 dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 39. "Oscillator (Part III)" (DS70216) of the "dsPIC33F/ PIC24H Family Reference Manual". which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 oscillator system provides:

- External and internal oscillator options as clock sources
- An on-chip Phase-Locked Loop (PLL) to scale the internal operating frequency to the required system clock frequency
- An internal FRC oscillator that can also be used with the PLL, thereby allowing full-speed operation without any external clock generation hardware
- Clock switching between various clock sources
- Programmable clock postscaler for system power savings
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and takes fail-safe measures
- An Oscillator Control register (OSCCON)
- Non-volatile Configuration bits for main oscillator selection
- · An auxiliary crystal oscillator for Audio DAC

A simplified diagram of the oscillator system is shown in Figure 9-1.

9.1 CPU Clocking System

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices provide seven system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with Phase-Locked Loop (PLL)
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Secondary (LP) Oscillator
- · Low-Power RC (LPRC) Oscillator
- FRC Oscillator with postscaler

9.1.1 SYSTEM CLOCK SOURCES

The Fast RC (FRC) internal oscillator runs at a nominal frequency of 7.37 MHz. User software can tune the FRC frequency. User software can optionally specify a factor (ranging from 1:2 to 1:256) by which the FRC clock frequency is divided. This factor is selected using the FRCDIV<2:0> bits (CLKDIV<10:8>).

The primary oscillator can use one of the following as its clock source:

- Crystal (XT): Crystals and ceramic resonators in the range of 3 MHz to 10 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- High-Speed Crystal (HS): Crystals in the range of 10 MHz to 40 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- External Clock (EC): External clock signal is directly applied to the OSC1 pin.

The secondary (LP) oscillator is designed for low power and uses a 32.768 kHz crystal or ceramic resonator. The LP oscillator uses the SOSCI and SOSCO pins.

The Low-Power RC (LPRC) internal oscillator runs at a nominal frequency of 32.768 kHz. It is also used as a reference clock by the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

The clock signals generated by the FRC and primary oscillators can be optionally applied to an on-chip PLL to provide a wide range of output frequencies for device operation. PLL configuration is described in Section 9.1.4 "PLL Configuration".

The FRC frequency depends on the FRC accuracy (see Table 30-19) and the value of the FRC Oscillator Tuning register (see Register 9-4).

9.1.2 SYSTEM CLOCK SELECTION

The oscillator source used at a device Power-on Reset event is selected using Configuration bit settings. The oscillator Configuration bit settings are located in the Configuration registers in the program memory. (Refer to Section 27.1 "Configuration Bits" for further details.) The Initial Oscillator Selection Configuration bits, FNOSC<2:0> (FOSCSEL<2:0>), and the Primary Oscillator Mode Configuration Select bits. POSCMD<1:0> (FOSC<1:0>), select the oscillator source that is used at a Power-on Reset. The FRC primary oscillator is the default (unprogrammed) selection.

The Configuration bits allow users to choose among 12 different clock modes, shown in Table 9-1.

The output of the oscillator (or the output of the PLL if a PLL mode has been selected) FOSC is divided by 2 to generate the device instruction clock (FCY) and peripheral clock time base (FP). FCY defines the operating speed of the device, and speeds up to 40 MHz are supported by the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/ X04 architecture.

Instruction execution speed or device operating frequency, FCY, is given by:

EQUATION 9-1: DEVICE OPERATING FREQUENCY

$$FCY = \frac{FOSC}{2}$$

9.1.3 AUXILIARY OSCILLATOR

The Auxiliary Oscillator (AOSC) can be used for peripherals that need to operate at a frequency unrelated to the system clock such as a Digital-to-Analog Converter (DAC).

The Auxiliary Oscillator can use one of the following as its clock source:

- Crystal (XT): Crystal and ceramic resonators in the range of 3 MHz to 10 MHz. The crystal is connected to the SOCI and SOSCO pins.
- High-Speed Crystal (HS): Crystals in the range of 10 to 40 MHz. The crystal is connected to the SOSCI and SOSCO pins.
- External Clock (EC): External clock signal up to 64 MHz. The external clock signal is directly applied to SOSCI pin.

9.1.4 PLL CONFIGURATION

The primary oscillator and internal FRC oscillator can optionally use an on-chip PLL to obtain higher speeds of operation. The PLL provides significant flexibility in selecting the device operating speed. A block diagram of the PLL is shown in Figure 9-2.

The output of the primary oscillator or FRC, denoted as 'FIN', is divided down by a prescale factor (N1) of 2, 3, ... or 33 before being provided to the PLL's Voltage Controlled Oscillator (VCO). The input to the VCO must be selected in the range of 0.8 MHz to 8 MHz. The prescale factor 'N1' is selected using the PLLPRE<4:0> bits (CLKDIV<4:0>).

The PLL Feedback Divisor, selected using the PLLDIV<8:0> bits (PLLFBD<8:0>), provides a factor 'M,' by which the input to the VCO is multiplied. This factor must be selected such that the resulting VCO output frequency is in the range of 100 MHz to 200 MHz.

The VCO output is further divided by a postscale factor 'N2.' This factor is selected using the PLLPOST<1:0> bits (CLKDIV<7:6>). 'N2' can be either 2, 4 or 8, and must be selected such that the PLL output frequency (Fosc) is in the range of 12.5 MHz to 80 MHz, which generates device operating speeds of 6.25-40 MIPS. For a primary oscillator or FRC oscillator, output 'FIN', the PLL output 'FOSC' is given by:

EQUATION 9-2: Fosc CALCULATION

$$FOSC = FIN \bullet \left(\frac{M}{N1 \bullet N2}\right)$$

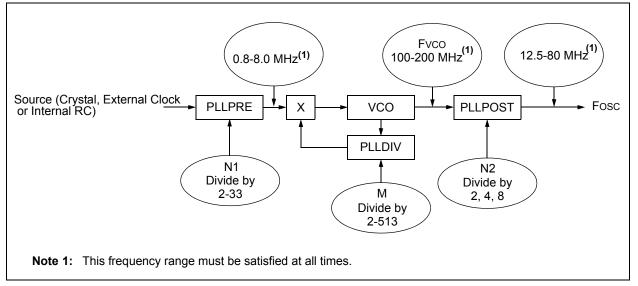

For example, suppose a 10 MHz crystal is being used with the selected oscillator mode of XT with PLL.

- If PLLPRE<4:0> = 0, then N1 = 2. This yields a VCO input of 10/2 = 5 MHz, which is within the acceptable range of 0.8-8 MHz.
- If PLLDIV<8:0> = 0x1E, then M = 32. This yields a VCO output of 5 x 32 = 160 MHz, which is within the 100-200 MHz ranged needed.
- If PLLPOST<1:0> = 0, then N2 = 2. This provides a Fosc of 160/2 = 80 MHz. The resultant device operating speed is 80/2 = 40 MIPS.

EQUATION 9-3: XT WITH PLL MODE EXAMPLE

$$FCY = \frac{FOSC}{2} = \frac{1}{2} \left(\frac{10000000 \bullet 32}{2 \bullet 2} \right) = 40MIPS$$

FIGURE 9-2: dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, AND dsPIC33FJ128GPX02/ X04 PLL BLOCK DIAGRAM

| TABLE 9-1. CONFIGURATION | BIT VALUES FOR C | | · | |
|--------------------------------------------------|-------------------|-------------|------------|-------------|

bit 6-0

9.4 Clock Switching Operation

Applications are free to switch among any of the four clock sources (Primary, LP, FRC and LPRC) under software control at any time. To limit the possible side effects of this flexibility, dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices have a safeguard lock built into the switch process.

Note: Primary Oscillator mode has three different submodes (XT, HS and EC), which are determined by the POSCMD<1:0> Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch among the different primary submodes without reprogramming the device.

9.4.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the Configuration register must be programmed to '0'. (Refer to **Section 27.1 "Configuration Bits**" for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and Fail-Safe Clock Monitor function are disabled. This is the default setting.

The NOSC control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSC bits (OSCCON<14:12>) reflect the clock source selected by the FNOSC Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled. It is held at '0' at all times.

9.4.2 OSCILLATOR SWITCHING SEQUENCE

Performing a clock switch requires this basic sequence:

- 1. If desired, read the COSC bits (OSCCON<14:12>) to determine the current oscillator source.
- 2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
- Write the appropriate value to the NOSC control bits (OSCCON<10:8>) for the new oscillator source.
- 4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
- 5. Set the OSWEN bit (OSCCON<0>) to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically as follows:

 The clock switching hardware compares the COSC status bits with the new value of the NOSC control bits. If they are the same, the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.

- If a valid clock switch has been initiated, the status bits, LOCK (OSCCON<5>) and the CF (OSCCON<3>) are cleared.
- The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware waits until the Oscillator Start-up Timer (OST) expires. If the new source is using the PLL, the hardware waits until a PLL lock is detected (LOCK = 1).
- 4. The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
- The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSC bit values are transferred to the COSC status bits.
- 6. The old clock source is turned off at this time, with the exception of LPRC (if WDT or FSCM are enabled) or LP (if LPOSCEN remains set).
 - Note 1: The processor continues to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.
 - 2: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.
 - 3: Refer to Section 39. "Oscillator (Part III)" (DS70216) in the "dsPIC33F/PIC24H Family Reference Manual" for details.

9.5 Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor (FSCM) allows the device to continue to operate even in the event of an oscillator failure. The FSCM function is enabled by programming. If the FSCM function is enabled, the LPRC internal oscillator runs at all times (except during Sleep mode) and is not subject to control by the Watchdog Timer.

In the event of an oscillator failure, the FSCM generates a clock failure trap event and switches the system clock over to the FRC oscillator. Then the application program can either attempt to restart the oscillator or execute a controlled shutdown. The trap can be treated as a warm Reset by simply loading the Reset address into the oscillator fail trap vector.

If the PLL multiplier is used to scale the system clock, the internal FRC is also multiplied by the same factor on clock failure. Essentially, the device switches to FRC with PLL on a clock failure.

NOTES:

10.0 POWER-SAVING FEATURES

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 9. "Watchdog Timer and Power-Saving Modes" (DS70196) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/ X04 devices can manage power consumption in four ways:

- Clock frequency
- Instruction-based Sleep and Idle modes
- · Software-controlled Doze mode
- Selective peripheral control in software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

10.1 Clock Frequency and Clock Switching

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or highprecision oscillators by simply changing the NOSC bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in Section 9.0 "Oscillator Configuration".

10.2 Instruction-Based Power-Saving Modes

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in Example 10-1.

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to wake up.

10.2.1 SLEEP MODE

The following occur in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals can continue to operate. This includes items such as the input change notification on the I/O ports, or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of these events:

- · Any interrupt source that is individually enabled
- · Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

EXAMPLE 10-1: PWRSAV INSTRUCTION SYNTAX

PWRSAV #SLEEP_MODE ; Put the device into SLEEP mode
PWRSAV #IDLE MODE ; Put the device into IDLE mode

10.2.2 IDLE MODE

The following occur in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see Section 10.4 "Peripheral Module Disable").
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device wakes from Idle mode on any of these events:

- · Any interrupt that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 clock cycles later), starting with the instruction following the PWRSAV instruction, or the first instruction in the ISR.

10.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a PWRSAV instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

10.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this cannot be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the ECAN module has been configured for 500 kbps based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the ECAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

10.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC[®] DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note: If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

10.5 Power-Saving Resources

Many useful resources related to Power-Saving are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

11.0 I/O PORTS

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section "30. I/O Ports with Peripheral Pin Select" (DS70190) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

All of the device pins (except VDD, VSS, MCLR and OSC1/CLKI) are shared among the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

11.1 Parallel I/O (PIO) Ports

Generally a parallel I/O port that shares a pin with a peripheral is subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents "loop through," in which a port's digital output can drive the input of a peripheral that shares the same pin. Figure 11-1 shows how ports are shared with other peripherals and the associated I/O pin to which they are connected.

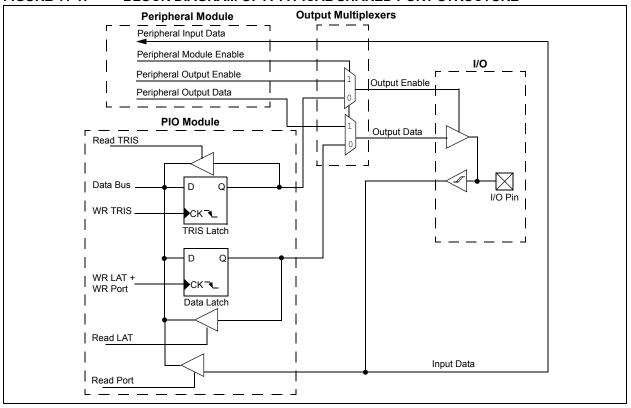

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

Any bit and its associated data and control registers that are not valid for a particular device is disabled. This means the corresponding LATx and TRISx registers and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

© 2007-2012 Microchip Technology Inc.

11.2 Open-Drain Configuration

In addition to the PORT, LAT and TRIS registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to "**Pin Diagrams**" for the available pins and their functionality.

11.3 Configuring Analog Port Pins

The AD1PCFGL and TRIS registers control the operation of the Analog-to-Digital (ADC) port pins. The port pins that are to function as analog inputs must have their corresponding TRIS bit set (input). If the TRIS bit is cleared (output), the digital output level (VOH or VOL) is converted.

The AD1PCFGL register has a default value of 0x0000; therefore, all pins that share ANx functions are analog (not digital) by default.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

11.4 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP, as shown in Example 11-1.

11.5 Input Change Notification

The input change notification function of the I/O ports allows the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/ X04 devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-ofstates even in Sleep mode, when the clocks are disabled. Depending on the device pin count, up to 21 external signals (CNx pin) can be selected (enabled) for generating an interrupt request on a change-ofstate.

Four control registers are associated with the CN module. The CNEN1 and CNEN2 registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

Note: Pull-ups on change notification pins should always be disabled when the port pin is configured as a digital output.

EXAMPLE 11-1:

11.6 Peripheral Pin Select

Peripheral pin select configuration enables peripheral set selection and placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, programmers can better tailor the microcontroller to their entire application, rather than trimming the application to fit the device.

The peripheral pin select configuration feature operates over a fixed subset of digital I/O pins. Programmers can independently map the input and/or output of most digital peripherals to any one of these I/O pins. Peripheral pin select is performed in software, and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping, once it has been established.

11.6.1 AVAILABLE PINS

The peripheral pin select feature is used with a range of up to 26 pins. The number of available pins depends on the particular device and its pin count. Pins that support the peripheral pin select feature include the designation "RPn" in their full pin designation, where "RP" designates a remappable peripheral and "n" is the remappable pin number.

11.6.2 CONTROLLING PERIPHERAL PIN SELECT

Peripheral pin select features are controlled through two sets of special function registers: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

11.6.2.1 Input Mapping

The inputs of the peripheral pin select options are mapped on the basis of the peripheral. A control register associated with a peripheral dictates the pin it is mapped to. The RPINRx registers are used to configure peripheral input mapping (see Register 11-1 through Register 11-16). Each register contains sets of 5-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 5-bit value maps the RPn pin with that value to that peripheral. For any given device, the valid range of values for any bit field corresponds to the maximum number of peripheral pin selections supported by the device.

Figure 11-2 illustrates remappable pin selection for U1RX input.

Note 1: Unless otherwise noted, all inputs use Schmitt input buffers.

11.6.2.2 Output Mapping

In contrast to inputs, the outputs of the peripheral pin select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Like the RPINRx registers, each register contains sets of 5-bit fields, with each set associated with one RPn pin (see Register 11-17 through Register 11-29). The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 11-2 and Figure 11-3).

The list of peripherals for output mapping also includes a null value of '00000' because of the mapping technique. This permits any given pin to remain unconnected from the output of any of the pin selectable peripherals.

Function RPnR<4:0> **Output Name** NULL RPn tied to default port pin 00000 C10UT RPn tied to Comparator1 Output 00001 C2OUT RPn tied to Comparator2 Output 00010 U1TX 00011 RPn tied to UART1 Transmit **U1RTS** 00100 RPn tied to UART1 Ready To Send U2TX RPn tied to UART2 Transmit 00101 U2RTS 00110 RPn tied to UART2 Ready To Send SDO1 RPn tied to SPI1 Data Output 00111 SCK1 01000 RPn tied to SPI1 Clock Output SS1 01001 RPn tied to SPI1 Slave Select Output SDO2 RPn tied to SPI2 Data Output 01010 RPn tied to SPI2 Clock Output SCK2 01011 SS2 RPn tied to SPI2 Slave Select Output 01100 CSDO 01101 RPn tied to DCI Serial Data Output CSCK RPn tied to DCI Serial Clock Output 01110 COFS RPn tied to DCI Frame Sync Output 01111 C1TX 10000 RPn tied to ECAN1 Transmit OC1 RPn tied to Output Compare 1 10010 OC2 RPn tied to Output Compare 2 10011 OC3 RPn tied to Output Compare 3 10100

11.6.3 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. dsPIC33F devices include three features to prevent alterations to the peripheral map:

- Control register lock sequence
- Continuous state monitoring
- Configuration bit pin select lock

11.6.3.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (OSCCON<6>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, a specific command sequence must be executed:

- 1. Write 0x46 to OSCCON<7:0>.
- 2. Write 0x57 to OSCCON<7:0>.
- 3. Clear (or set) IOLOCK as a single operation.

Note: MPLAB[®] C30 provides built-in C language functions for unlocking the OSCCON register: __builtin_write_OSCCONL(value) __builtin_write_OSCCONH(value) See MPLAB Help for more information.

Unlike the similar sequence with the oscillator's LOCK bit, IOLOCK remains in one state until changed. This allows all of the peripheral pin selects to be configured with a single unlock sequence followed by an update to all control registers, then locked with a second lock sequence.

11.6.3.2 Continuous State Monitoring

In addition to being protected from direct writes, the contents of the RPINRx and RPORx registers are constantly monitored in hardware by shadow registers. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a configuration mismatch Reset is triggered.

11.6.3.3 Configuration Bit Pin Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPINRx and RPORx registers. The IOL1WAY configuration bit (FOSC<5>) blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the peripheral pin select control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session. Programming IOL1WAY allows user applications unlimited access (with the proper use of the unlock sequence) to the peripheral pin select registers.

11.7 I/O Helpful Tips

- 1. In some cases, certain pins as defined in TABLE 30-9: "DC Characteristics: I/O Pin Input Specifications" under "Injection Current", have internal protection diodes to VDD and VSS. The term "Injection Current" is also referred to as "Clamp Current". On designated pins, with sufficient external current limiting precautions by the user, I/O pin input voltages are allowed to be greater or less than the data sheet absolute maximum ratings with nominal VDD with respect to the VSS and VDD supplies. Note that when the user application forward biases either of the high or low side internal input clamp diodes, that the resulting current being injected into the device that is clamped internally by the VDD and VSS power rails, may affect the ADC accuracy by four to six counts.
- I/O pins that are shared with any analog input pin, 2. (i.e., ANx), are always analog pins by default after any reset. Consequently, any pin(s) configured as an analog input pin, automatically disables the digital input pin buffer. As such, any attempt to read a digital input pin will always return a '0' regardless of the digital logic level on the pin if the analog pin is configured. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the analog pin configuration registers in the ADC module, (i.e., ADxPCFGL, AD1PCFGH), by setting the appropriate bit that corresponds to that I/O port pin to a '1'. On devices with more than one ADC, both analog pin configurations for both ADC modules must be configured as a digital I/O pin for that pin to function as a digital I/O pin.
- **Note:** Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.
- 3. Most I/O pins have multiple functions. Referring to the device pin diagrams in the data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name from left-toright. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1. This indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.

- 4. Each CN pin has a configurable internal weak pull-up resistor. The pull-ups act as a current source connected to the pin, and eliminates the need for external resistors in certain applications. The internal pull-up is to ~(VDD-0.8) not VDD. This is still above the minimum VIH of CMOS and TTL devices.
- 5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the VOH/IOH and VOL/IOL DC characteristic specification. The respective IOH and IOL current rating only applies to maintaining the corresponding output at or above the VOH and at or below the VOL levels. However, for LEDs unlike digital inputs of an externally connected device, they are not governed by the same minimum VIH/VIL levels. An I/O pin output can safely sink or source any current less than that listed in the absolute maximum rating section of the data sheet. For example:

VOH = 2.4v @ IOH = -8 mA and VDD = 3.3V

The maximum output current sourced by any 8 mA I/O pin = 12 mA.

LED source current < 12 mA is technically permitted. Refer to the VOH/IOH graphs in Section 30.0 "Electrical Characteristics" for additional information.

11.8 I/O Resources

Many useful resources related to I/O are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

11.9 Peripheral Pin Select Registers

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 family of devices implement 33 registers for remappable peripheral configuration:

- 16 Input Remappable Peripheral Registers:
 - RPINR0-RPINR1, RPINR3-RPINR4, RPINR7, RPINR10-RPINR11 and PRINR18-RPINR26
- 13 Output Remappable Peripheral Registers:
 - RPOR0-RPOR12

NOTES:

12.0 TIMER1

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 11. "Timers" (DS70205) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer, which can serve as the time counter for the real-time clock, or operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be operated from the low power 32 kHz crystal oscillator available on the device
- Can be operated in Asynchronous Counter mode from an external clock source.
- The external clock input (T1CK) can optionally be synchronized to the internal device clock and the clock synchronization is performed after the prescaler.

The unique features of Timer1 allow it to be used for Real-Time Clock (RTC) applications. A block diagram of Timer1 is shown in Figure 12-1.

The Timer1 module can operate in one of the following modes:

- Timer mode
- · Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (FcY). In Synchronous and Asynchronous Counter modes, the input clock is derived from the external clock input at the T1CK pin.

The Timer modes are determined by the following bits:

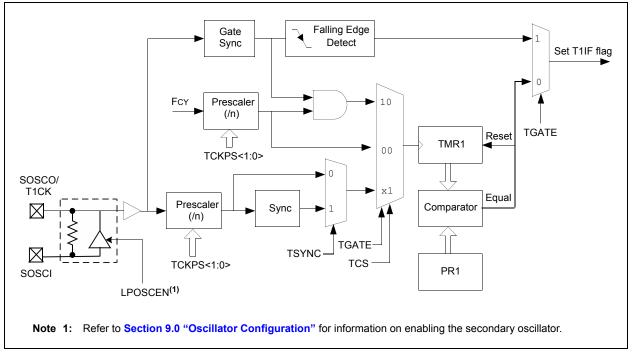

- Timer Clock Source Control bit (TCS): T1CON<1>
- Timer Synchronization Control bit (TSYNC): T1CON<2>
- Timer Gate Control bit (TGATE): T1CON<6>

Timer control bit setting for different operating modes are given in the Table 12-1.

TABLE 12-1: TIMER MODE SETTINGS

| Mode | TCS | TGATE | TSYNC |
|----------------------|-----|-------|-------|
| Timer | 0 | 0 | Х |
| Gated timer | 0 | 1 | х |
| Synchronous counter | 1 | х | 1 |
| Asynchronous counter | 1 | х | 0 |

NOTES:

13.0 TIMER2/3 AND TIMER4/5 FEATURE

- Note 1: This data sheet summarizes the features dsPIC33FJ32GP302/304. the of dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 11. "Timers" (DS70205) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com). 2: Some registers and associated bits
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

Timer2 and Timer4 are Type B timers with the following specific features:

- A Type B timer can be concatenated with a Type C timer to form a 32-bit timer
- The external clock input (TxCK) is always synchronized to the internal device clock and the clock synchronization is performed after the prescaler.

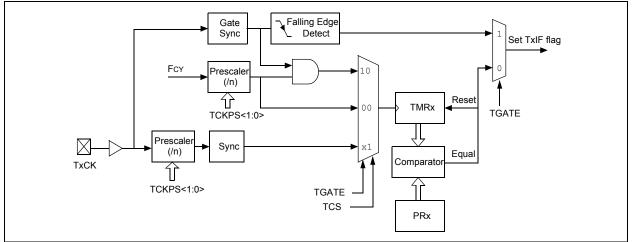

A block diagram of the Type B timer is shown in Figure 13-1.

Timer3 and Timer5 are Type C timers with the following specific features:

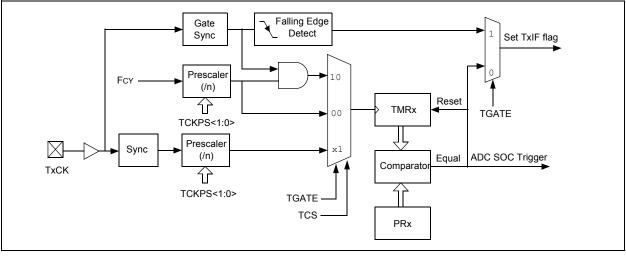

- A Type C timer can be concatenated with a Type B timer to form a 32-bit timer
- At least one Type C timer has the ability to trigger an analog-to-digital conversion.
- The external clock input (TxCK) is always synchronized to the internal device clock and the clock synchronization is performed before the prescaler

A block diagram of the Type C timer is shown in Figure 13-2.

FIGURE 13-1: TYPE B TIMER BLOCK DIAGRAM (x = 2 or 4)

The Timer2/3 and Timer4/5 modules can operate in one of the following modes:

- · Timer mode
- · Gated Timer mode
- Synchronous Counter mode

In Timer and Gated Timer modes, the input clock is derived from the internal instruction cycle clock (FcY). In Synchronous Counter mode, the input clock is derived from the external clock input at TxCK pin.

The timer modes are determined by the following bits:

- TCS (TxCON<1>): Timer Clock Source Control bit
- TGATE (TxCON<6>): Timer Gate Control bit

Timer control bit settings for different operating modes are given in the Table 13-1.

| Mode | TCS | TGATE |
|---------------------|-----|-------|
| Timer | 0 | 0 |
| Gated timer | 0 | 1 |
| Synchronous counter | 1 | Х |

13.1 16-bit Operation

To configure any of the timers for individual 16-bit operation:

- 1. Clear the T32 bit corresponding to that timer.
- 2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
- 3. Set the Clock and Gating modes using the TCS and TGATE bits.
- 4. Load the timer period value into the PRx register.
- 5. If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP<2:0>, to set the interrupt priority.
- 6. Set the TON bit.

| Note: | Only Timer2 and Timer3 can trigger a | ı |
|-------|--------------------------------------|---|
| | DMA data transfer. | |

13.2 32-bit Operation

A 32-bit timer module can be formed by combining a Type B and a Type C 16-bit timer module. For 32-bit timer operation, the T32 control bit in the Type B Timer Control register (TxCON<3>) must be set. The Type C timer holds the most significant word (msw) and the Type B timer holds the least significant word (lsw) for 32-bit operation.

When configured for 32-bit operation, only the Type B Timer Control register (TxCON) bits are required for setup and control. Type C timer control register bits are ignored (except TSIDL bit). For interrupt control, the combined 32-bit timer uses the interrupt enable, interrupt flag and interrupt priority control bits of the Type C timer. The interrupt control and status bits for the Type B timer are ignored during 32-bit timer operation.

The Type B and Type C timers that can be combined to form a 32-bit timer are listed in Table 13-2.

TABLE 13-2: 32-BIT TIMER

| TYPE B Timer (Isw) | TYPE C Timer (msw) |
|--------------------|--------------------|
| Timer2 | Timer3 |
| Timer4 | Timer5 |

A block diagram representation of the 32-bit timer module is shown in Figure 13-3. The 32-bit timer module can operate in one of the following modes:

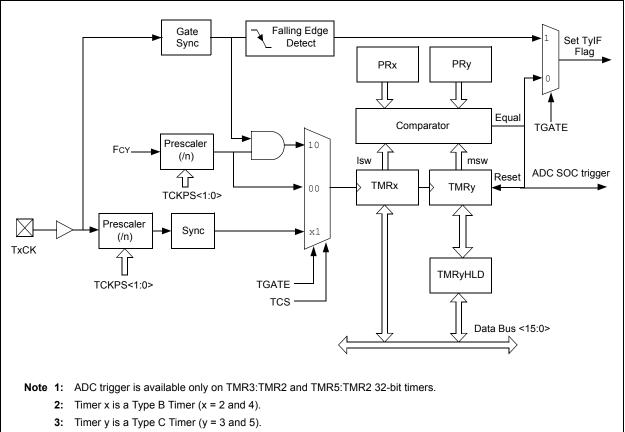

- Timer mode
- · Gated Timer mode
- · Synchronous Counter mode

To configure the features of Timer2/3 or Timer4/5 for 32-bit operation:

- 1. Set the T32 control bit.
- 2. Select the prescaler ratio for Timer2 or Timer4 using the TCKPS<1:0> bits.
- 3. Set the Clock and Gating modes using the corresponding TCS and TGATE bits.
- Load the timer period value. PR3 or PR5 contains the most significant word of the value, while PR2 or PR4 contains the least significant word.
- If interrupts are required, set the interrupt enable bits, T3IE or T5IE. Use the priority bits, T3IP<2:0> or T5IP<2:0> to set the interrupt priority. While Timer2 or Timer4 controls the timer, the interrupt appears as a Timer3 or Timer5 interrupt.
- 6. Set the corresponding TON bit.

The timer value at any point is stored in the register pair, TMR3:TMR2 or TMR5:TMR4, which always contains the most significant word of the count, while TMR2 or TMR4 contains the least significant word.

13.3 Timer Resources

Many useful resources related to Timers are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

REGISTER 13-2: TxCON: TIMER CONTROL REGISTER (x = 3 OR 5)

Note 1: When 32-bit timer operation is enabled (T32 = 1) in the Timer Control register (TxCON<3>), the TSIDL bit must be cleared to operate the 32-bit timer in Idle mode.

2: When the 32-bit timer operation is enabled (T32 = 1) in the Timer Control register (TxCON<3>), these bits have no effect.

NOTES:

14.0 INPUT CAPTURE

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 12. "Input Capture" (DS70198) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices support up to four input capture channels.

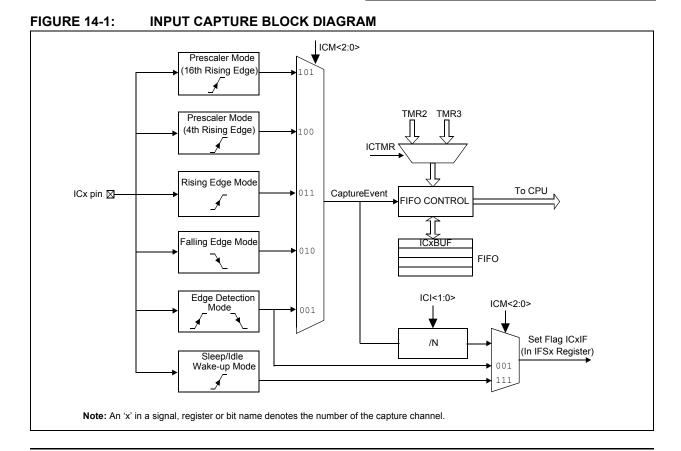

The input capture module captures the 16-bit value of the selected Time Base register when an event occurs at the ICx pin. The events that cause a capture event are listed below in three categories:

- 1. Simple Capture Event modes:
 - Capture timer value on every falling edge of input at ICx pin
 - Capture timer value on every rising edge of input at ICx pin
- 2. Capture timer value on every edge (rising and falling)
- 3. Prescaler Capture Event modes:
 - Capture timer value on every 4th rising edge of input at ICx pin
 - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select one of two 16bit timers (Timer2 or Timer3) for the time base. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during CPU Sleep and Idle modes
- · Interrupt on input capture event
- · 4-word FIFO buffer for capture values
 - Interrupt optionally generated after 1, 2, 3 or 4 buffer locations are filled
- Use of input capture to provide additional sources of external interrupts
- Note: Only IC1 and IC2 can trigger a DMA data transfer. If DMA data transfers are required, the FIFO buffer size must be set to '1' (ICI<1:0> = 00)

14.1 Input Capture Resources

Many useful resources related to Input Capture are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

NOTES:

15.0 OUTPUT COMPARE

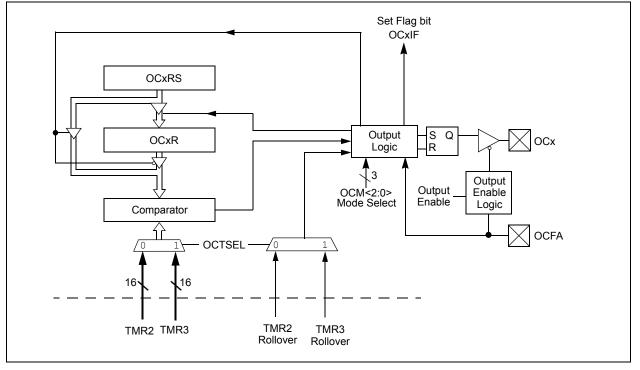

- This data sheet summarizes the features Note 1: of the dsPIC33FJ32GP302/304. dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 13. "Output Compare" (DS70209) of the "dsPIC33F/ PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Output Compare module can select either Timer2 or Timer3 for its time base. The module compares the value of the timer with the value of one or two compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the compare register value. The Output Compare module generates either a single output pulse or a sequence of output pulses, by changing the state of the output pin on the compare match events. The Output Compare module can also generate interrupts on compare match events.

The Output Compare module has multiple operating modes:

- Active-Low One-Shot mode
- Active-High One-Shot mode
- Toggle mode
- · Delayed One-Shot mode
- Continuous Pulse mode
- PWM mode without Fault protection
- PWM mode with Fault protection

FIGURE 15-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM

15.1 Output Compare Modes

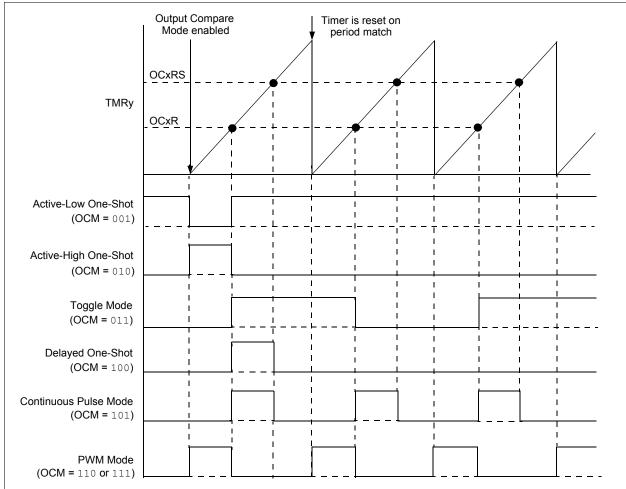

Configure the Output Compare modes by setting the appropriate Output Compare Mode bits (OCM<2:0>) in the Output Compare Control register (OCxCON<2:0>). Table 15-1 lists the different bit settings for the Output Compare modes. Figure 15-2 illustrates the output compare operation for various modes. The user application must disable the associated timer when writing to the output compare control registers to avoid malfunctions.

| TABLE 15-1: | OUTPUT COMPARE MODES |
|-------------|-----------------------------|
|-------------|-----------------------------|

- Note 1: Only OC1 and OC2 can trigger a DMA data transfer.
 - 2: See Section 13. "Output Compare" (DS70209) in the "dsPIC33F/PIC24H Family Reference Manual" for OCxR and OCxRS register restrictions.

| OCM<2:0> | Mode | OCx Pin Initial State | OCx Interrupt Generation |
|----------|--------------------------------------|----------------------------------------------|----------------------------------|
| 000 | Module Disabled | Controlled by GPIO register | — |
| 001 | Active-Low One-Shot | 0 | OCx Rising edge |
| 010 | Active-High One-Shot | 1 | OCx Falling edge |
| 011 | Toggle Mode | Current output is maintained | OCx Rising and Falling edge |
| 100 | Delayed One-Shot | 0 | OCx Falling edge |
| 101 | Continuous Pulse mode | 0 | OCx Falling edge |
| 110 | PWM mode without fault protection | 0, if OCxR is zero 1, if OCxR is non-zero | No interrupt |
| 111 | PWM mode with fault protection | 0, if OCxR is zero 1, if OCxR is non-zero | OCFA Falling edge for OC1 to OC4 |

16.0 SERIAL PERIPHERAL INTERFACE (SPI)

- Note 1: This data sheet summarizes the features dsPIC33FJ32GP302/304. the of dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 18. "Serial Peripheral Interface (SPI)" (DS70206) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, analog-to-digital converters, etc. The SPI module is compatible with Motorola[®] SPI and SIOP.

Each SPI module consists of a 16-bit shift register, SPIxSR (where x = 1 or 2), used for shifting data in and out, and a buffer register, SPIxBUF. A control register, SPIxCON, configures the module. Additionally, a status register, SPIxSTAT, indicates status conditions.

The serial interface consists of 4 pins:

- · SDIx (serial data input)
- SDOx (serial data output)
- <u>SCK</u>x (shift clock input or output)
- SSx (active-low slave select).

In Master mode operation, SCK is a clock output. In Slave mode, it is a clock input.

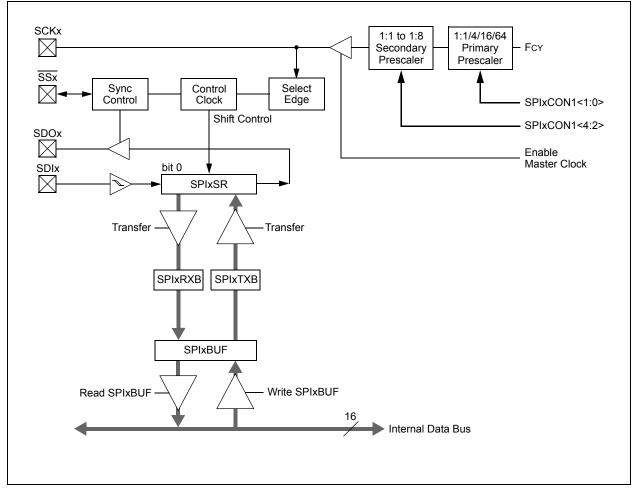

FIGURE 16-1: SPI MODULE BLOCK DIAGRAM

16.1 SPI Helpful Tips

- 1. In Frame mode, if there is a possibility that the master may not be initialized before the slave:
 - a) If FRMPOL (SPIxCON2<13>) = 1, use a pull-down resistor on SSx.
 - b) If FRMPOL = 0, use a pull-up resistor on $\frac{1}{SSx}$.

| Note: | This | insures | that | the | first | fra | ame |
|-------|--------|-----------|---------|-----------|-------|-----|-----|
| | transr | nission a | after i | nitializa | ation | is | not |
| | shifte | | | | | | |

- 2. In non-framed 3-wire mode, (i.e., not using SSx from a master):
 - a) If CKP (SPIxCON1<6>) = 1, always place a pull-up resistor on SSx.
 - b) If CKP = <u>0</u>, always place a pull-down resistor on SSx.
 - **Note:** This will insure that during power-up and initialization the master/slave will not lose sync due to an errant SCK transition that would cause the slave to accumulate data shift errors for both transmit and receive appearing as corrupted data.
- FRMEN (SPIxCON2<15>) = 1 and SSEN (SPIxCON1<7>) = 1 are exclusive and invalid. In Frame mode, SCKx is continuous and the Frame sync pulse is active on the SSx pin, which indicates the start of a data frame.

Note: Not all third-party devices support Frame mode timing. Refer to the SPI electrical characteristics for details.

- In Master mode only, set the SMP bit (SPIxCON1<9>) to a '1' for the fastest SPI data rate possible. The SMP bit can only be set at the same time or after the MSTEN bit (SPIxCON1<5>) is set.
- 5. To avoid invalid slave read data to the master, the user's master software must guarantee enough time for slave software to fill its write buffer before the user application initiates a master write/read cycle. It is always advisable to preload the SPIxBUF transmit register in advance of the next master transaction cycle. SPIxBUF is transferred to the SPI shift register and is empty once the data transmission begins.

16.2 SPI Resources

Many useful resources related to SPI are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

17.0 INTER-INTEGRATED CIRCUIT™ (I²C™)

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 19. "Inter-Integrated Circuit™ (I²C™)" (DS70195) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit (I^2C) module provides complete hardware support for both Slave and Multi-Master modes of the I^2C serial communication standard, with a 16-bit interface.

The I²C module has a 2-pin interface:

- The SCLx pin is clock.
- The SDAx pin is data.

The I²C module offers the following key features:

- I²C interface supporting both Master and Slave modes of operation.
- I²C Slave mode supports 7-bit and 10-bit addressing
- I²C Master mode supports 7 and 10-bit addressing
- I²C Port allows bidirectional transfers between master and slaves.
- Serial clock synchronization for I²C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control).
- I²C supports multi-master operation, detects bus collision and arbitrates accordingly.

17.1 Operating Modes

The hardware fully implements all the master and slave functions of the I^2C Standard and Fast mode specifications, as well as 7 and 10-bit addressing.

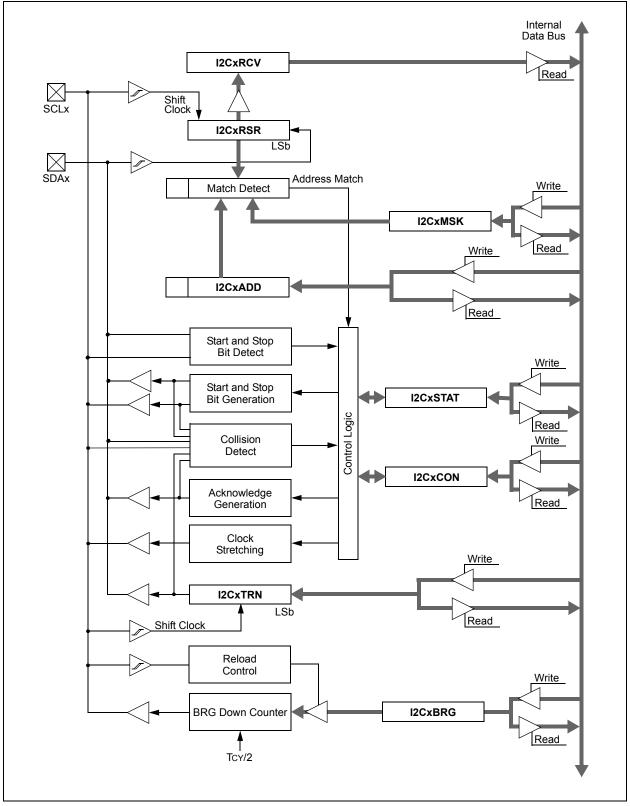

The l^2C module can operate either as a slave or a master on an l^2C bus.

The following types of I²C operation are supported:

- I²C slave operation with 7-bit addressing
- I²C slave operation with 10-bit addressing
- I²C master operation with 7-bit or 10-bit addressing

For details about the communication sequence in each of these modes, refer to the "*dsPIC33F/PIC24H Family Reference Manual*". Please see the Microchip website (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual chapters.

FIGURE 17-1: I^2C^{TM} BLOCK DIAGRAM (x = 1)

17.2 I²C Resources

Many useful resources related to I^2C are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

| Note: | In the event you are not able to access the product page using the link above, enter this URL in your browser: |

17.3 I²C Registers

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CSTAT are read/write:

- I2CxRSR is the shift register used for shifting data internal to the module and the user application has no access to it.
- I2CxRCV is the receive buffer and the register to which data bytes are written, or from which data bytes are read.
- I2CxTRN is the transmit register to which bytes are written during a transmit operation.
- The I2CxADD register holds the slave address.
- A status bit, ADD10, indicates 10-bit Address mode.
- The I2CxBRG acts as the Baud Rate Generator (BRG) reload value.

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV, and an interrupt pulse is generated.

18.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 17. "UART" (DS70188) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 device family. The UART is a full-duplex asynchronous system that can communicate with peripheral devices, such as personal computers, LIN 2.0, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the UxCTS and UxRTS pins and also includes an IrDA[®] encoder and decoder.

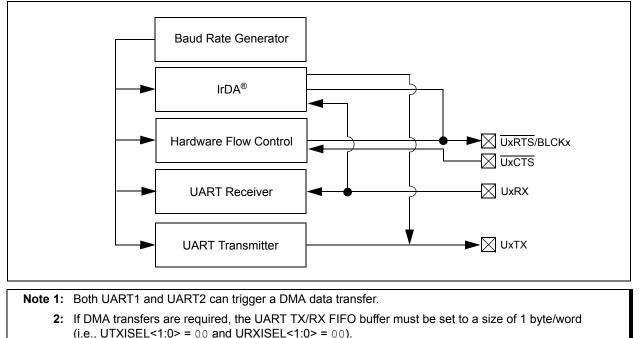

The primary features of the UART module are:

- Full-Duplex, 8-bit or 9-bit Data Transmission through the UxTX and UxRX pins
- Even, Odd or No Parity Options (for 8-bit data)
- One or two stop bits
- Hardware flow control option with UxCTS and UxRTS pins
- Fully integrated Baud Rate Generator with 16-bit prescaler
- Baud rates ranging from 10 Mbps to 38 bps at 40 MIPS
- 4-deep First-In First-Out (FIFO) Transmit Data buffer
- · 4-deep FIFO Receive Data buffer
- · Parity, framing and buffer overrun error detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- · Transmit and Receive interrupts
- · A separate interrupt for all UART error conditions
- · Loopback mode for diagnostic support
- Support for sync and break characters
- · Support for automatic baud rate detection
- IrDA[®] encoder and decoder logic
- 16x baud clock output for IrDA[®] support

A simplified block diagram of the UART module is shown in Figure 18-1. The UART module consists of these key hardware elements:

- · Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

FIGURE 18-1: UART SIMPLIFIED BLOCK DIAGRAM

18.1 UART Helpful Tips

- 1. In multi-node direct-connect UART networks, UART receive inputs react to the complementary logic level defined by the URXINV bit (UxMODE<4>), which defines the idle state, the default of which is logic high, (i.e., URXINV = 0). Because remote devices do not initialize at the same time, it is likely that one of the devices, because the RX line is floating, will trigger a start bit detection and will cause the first byte received after the device has been initialized to be invalid. To avoid this situation, the user should use a pull-up or pull-down resistor on the RX pin depending on the value of the URXINV bit.
 - a) If URXINV = 0, use a pull-up resistor on the RX pin.
 - b) If URXINV = 1, use a pull-down resistor on the RX pin.
- 2. The first character received on a wake-up from Sleep mode caused by activity on the UxRX pin of the UART module will be invalid. In Sleep mode, peripheral clocks are disabled. By the time the oscillator system has restarted and stabilized from Sleep mode, the baud rate bit sampling clock relative to the incoming UxRX bit timing is no longer synchronized, resulting in the first character being invalid. This is to be expected.

18.2 UART Resources

Many useful resources related to UART are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

19.0 ENHANCED CAN (ECAN™) MODULE

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 21. "Enhanced Controller Area Network (ECAN™)" (DS70185) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - 2: Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

19.1 Overview

The Enhanced Controller Area Network (ECAN[™]) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices contain up to two ECAN modules.

The ECAN module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH CAN specification. The module supports CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN specification is not covered within this data sheet. The reader can refer to the BOSCH CAN specification for further details.

The module features are as follows:

- Implementation of the CAN protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and extended data frames
- 0-8 bytes data length
- Programmable bit rate up to 1 Mbit/sec
- Automatic response to remote transmission requests
- Up to eight transmit buffers with application specified prioritization and abort capability (each buffer can contain up to 8 bytes of data)
- Up to 32 receive buffers (each buffer can contain up to 8 bytes of data)
- Up to 16 full (standard/extended identifier)
 acceptance filters
- Three full acceptance filter masks
- DeviceNet[™] addressing support
- Programmable wake-up functionality with integrated low-pass filter
- Programmable Loopback mode supports self-test operation
- Signaling via interrupt capabilities for all CAN receiver and transmitter error states
- · Programmable clock source
- Programmable link to input capture module (IC2 for CAN1) for time-stamping and network synchronization
- · Low-power Sleep and Idle mode

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors and then matched against filters to see if it should be received and stored in one of the receive registers.

19.2 Frame Types

The ECAN module transmits various types of frames which include data messages, or remote transmission requests initiated by the user, as other frames that are automatically generated for control purposes. The following frame types are supported:

- Standard Data Frame: A standard data frame is generated by a node when the node wishes to transmit data. It includes an 11-bit Standard Identifier (SID), but not an 18bit Extended Identifier (EID).
- Extended Data Frame: An extended data frame is similar to a standard data frame, but includes an extended identifier as well.
- Remote Frame:

It is possible for a destination node to request the data from the source. For this purpose, the destination node sends a remote frame with an identifier that matches the identifier of the required data frame. The appropriate data source node sends a data frame as a response to this remote request.

• Error Frame:

An error frame is generated by any node that detects a bus error. An error frame consists of two fields: an error flag field and an error delimiter field.

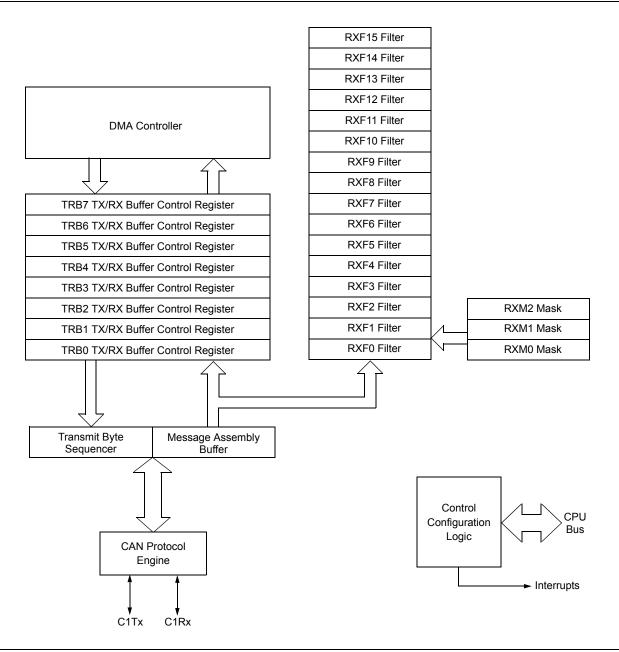

• Overload Frame:

An overload frame can be generated by a node as a result of two conditions. First, the node detects a dominant bit during interframe space which is an illegal condition. Second, due to internal conditions, the node is not yet able to start reception of the next message. A node can generate a maximum of 2 sequential overload frames to delay the start of the next message.

· Interframe Space:

Interframe space separates a proceeding frame (of whatever type) from a following data or remote frame.

19.3 Modes of Operation

The ECAN module can operate in one of several operation modes selected by the user. These modes include:

- Initialization mode
- · Disable mode
- Normal Operation mode
- Listen Only mode
- Listen All Messages mode
- · Loopback mode

Modes are requested by setting the REQOP<2:0> bits (CiCTRL1<10:8>). Entry into a mode is Acknowledged by monitoring the OPMODE<2:0> bits (CiCTRL1<7:5>). The module does not change the mode and the OPMODE bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

19.3.1 INITIALIZATION MODE

In the Initialization mode, the module does not transmit or receive. The error counters are cleared and the interrupt flags remain unchanged. The user application has access to Configuration registers that are access restricted in other modes. The module protects the user from accidentally violating the CAN protocol through programming errors. All registers which control the configuration of the module cannot be modified while the module is on-line. The ECAN module is not allowed to enter the Configuration mode while a transmission is taking place. The Configuration mode serves as a lock to protect the following registers:

- All Module Control registers
- Baud Rate and Interrupt Configuration registers
- Bus Timing registers
- Identifier Acceptance Filter registers
- Identifier Acceptance Mask registers

19.3.2 DISABLE MODE

In Disable mode, the module does not transmit or receive. The module has the ability to set the WAKIF bit due to bus activity, however, any pending interrupts remains and the error counters retains their value.

If the REQOP<2:0> bits (CiCTRL1<10:8>) = 001, the module enters the Module Disable mode. If the module is active, the module waits for 11 recessive bits on the CAN bus, detect that condition as an Idle bus, then accept the module disable command. When the OPMODE<2:0> bits (CiCTRL1<7:5>) = 001, that indicates whether the module successfully went into Module Disable mode. The I/O pins reverts to normal I/O function when the module is in the Module Disable mode.

The module can be programmed to apply a low-pass filter function to the CiRX input line while the module or the CPU is in Sleep mode. The WAKFIL bit (CiCFG2<14>) enables or disables the filter.

Note: Typically, if the ECAN module is allowed to transmit in a particular mode of operation and a transmission is requested immediately after the ECAN module has been placed in that mode of operation, the module waits for 11 consecutive recessive bits on the bus before starting transmission. If the user switches to Disable mode within this 11-bit period, then this transmission is aborted and the corresponding TXABT bit is set and TXREQ bit is cleared.

19.3.3 NORMAL OPERATION MODE

Normal Operation mode is selected when REQOP<2:0> = 000. In this mode, the module is activated and the I/O pins assumes the CAN bus functions. The module transmits and receive CAN bus messages via the CiTX and CiRX pins.

19.3.4 LISTEN ONLY MODE

If the Listen Only mode is activated, the module on the CAN bus is passive. The transmitter buffers revert to the port I/O function. The receive pins remain inputs. For the receiver, no error flags or Acknowledge signals are sent. The error counters are deactivated in this state. The Listen Only mode can be used for detecting the baud rate on the CAN bus. To use this, it is necessary that there are at least two further nodes that communicate with each other.

19.3.5 LISTEN ALL MESSAGES MODE

The module can be set to ignore all errors and receive any message. The Listen All Messages mode is activated by setting REQOP<2:0> = '111'. In this mode, the data which is in the message assembly buffer, until the time an error occurred, is copied in the receive buffer and can be read via the CPU interface.

19.3.6 LOOPBACK MODE

If the Loopback mode is activated, the module connects the internal transmit signal to the internal receive signal at the module boundary. The transmit and receive pins revert to their port I/O function.

19.4 ECAN Resources

Many useful resources related to ECAN are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

| Note: | In the event you are not able to access the product page using the link above, enter this URL in your browser: |

REGISTER 19-26: CITRmnCON: ECAN™ TX/RX BUFFER m CONTROL REGISTER

The buffers, SID, EID, DLC, Data Field and Receive Status registers are located in DMA RAM. Note:

19.6 ECAN Message Buffers

ECAN Message Buffers are part of DMA RAM Memory. They are not ECAN special function registers. The user application must directly write into the DMA RAM area that is configured for ECAN Message Buffers. The location and size of the buffer area is defined by the user application.

20.0 DATA CONVERTER INTERFACE (DCI) MODULE

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 20. "Data Converter Interface (DCI)" (DS70288) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

20.1 Module Introduction

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 Data Converter Interface (DCI) module allows simple interfacing of devices, such as audio coder/decoders (Codecs), ADC and D/A converters. The following interfaces are supported:

- Framed Synchronous Serial Transfer (Single or Multi-Channel)
- Inter-IC Sound (I²S) Interface
- · AC-Link Compliant mode
- The DCI module provides the following general features:
- · Programmable word size up to 16 bits
- Supports up to 16 time slots, for a maximum frame size of 256 bits
- Data buffering for up to 4 samples without CPU overhead

20.2 DCI Resources

Many useful resources related to DCI are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

| Note: | In the event you are not able to access the |

21.0 10-BIT/12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 16. "Analog-to-Digital Converter (ADC)" (DS70183) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices have up to 13 ADC input channels.

The AD12B bit (AD1CON1<10>) allows each of the ADC modules to be configured by the user as either a 10-bit, 4-sample/hold ADC (default configuration) or a 12-bit, 1-sample/hold ADC.

Note: The ADC module needs to be disabled before modifying the AD12B bit.

21.1 Key Features

The 10-bit ADC configuration has the following key features:

- Successive Approximation (SAR) conversion
- Conversion speeds of up to 1.1 Msps
- Up to 13 analog input pins
- External voltage reference input pins
- Simultaneous sampling of up to four analog input pins
- Automatic Channel Scan mode
- Selectable conversion trigger source
- Selectable Buffer Fill modes
- Four result alignment options (signed/unsigned, fractional/integer)
- · Operation during CPU Sleep and Idle modes

The 12-bit ADC configuration supports all the above features, except:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported
- There is only one sample/hold amplifier in the 12-bit configuration, so simultaneous sampling of multiple channels is not supported

Depending on the particular device pinout, the ADC can have up to 13 analog input pins, designated AN0 through AN12. In addition, there are two analog input pins for external voltage reference connections. These voltage reference inputs can be shared with other analog input pins. The actual number of analog input pins and external voltage reference input configuration depends on the specific device.

Block diagrams of the ADC module are shown in Figure 21-1 and Figure 21-2.

21.2 ADC Initialization

The following configuration steps should be performed.

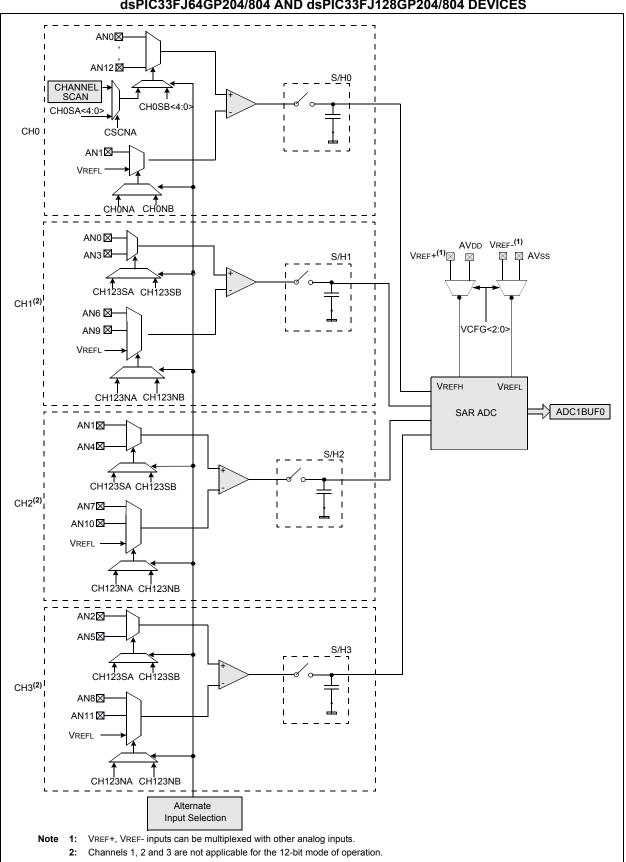

- 1. Configure the ADC module:
 - a) Select port pins as analog inputs (AD1PCFGH<15:0> or AD1PCFGL<15:0>)
 - b) Select voltage reference source to match expected range on analog inputs (AD1CON2<15:13>)
 - c) Select the analog conversion clock to match desired data rate with processor clock (AD1CON3<7:0>)
 - d) Determine how many S/H channels are used (AD1CON2<9:8> and AD1PCFGH<15:0> or AD1PCFGL<15:0>)
 - e) Select the appropriate sample/conversion sequence (AD1CON1<7:5> and AD1CON3<12:8>)
 - f) Select how conversion results are presented in the buffer (AD1CON1<9:8>)
 - g) Turn on ADC module (AD1CON1<15>)
- 2. Configure ADC interrupt (if required):
 - a) Clear the AD1IF bit
 - b) Select ADC interrupt priority

21.3 ADC and DMA

If more than one conversion result needs to be buffered before triggering an interrupt, DMA data transfers can be used. ADC1 can trigger a DMA data transfer. If ADC1 is selected as the DMA IRQ source, a DMA transfer occurs when the AD1IF bit gets set as a result of an ADC1 sample conversion sequence.

The SMPI<3:0> bits (AD1CON2<5:2>) are used to select how often the DMA RAM buffer pointer is incremented.

The ADDMABM bit (AD1CON1<12>) determines how the conversion results are filled in the DMA RAM buffer area being used for ADC. If this bit is set, DMA buffers are written in the order of conversion. The module provides an address to the DMA channel that is the same as the address used for the non-DMA standalone buffer. If the ADDMABM bit is cleared, then DMA buffers are written in Scatter/Gather mode. The module provides a scatter/gather address to the DMA channel, based on the index of the analog input and the size of the DMA buffer.

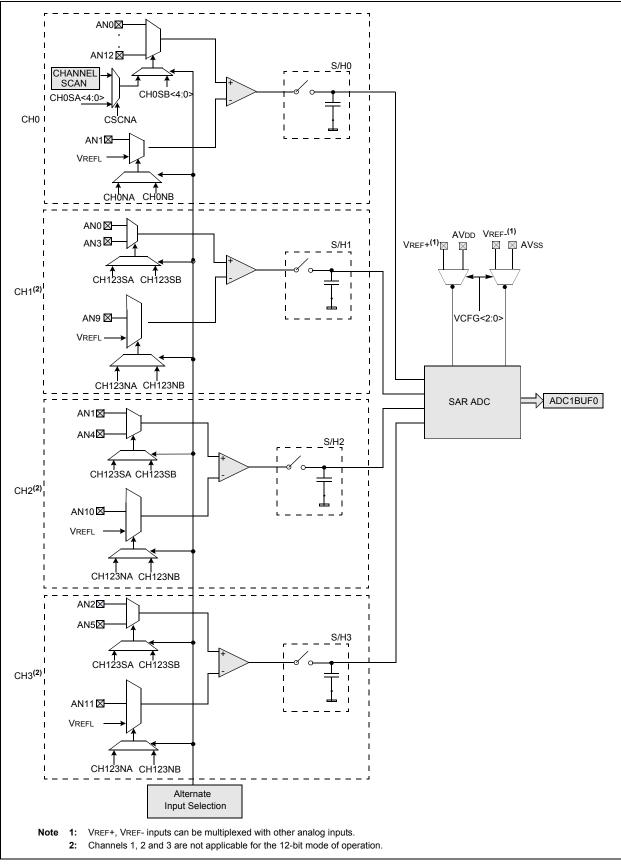

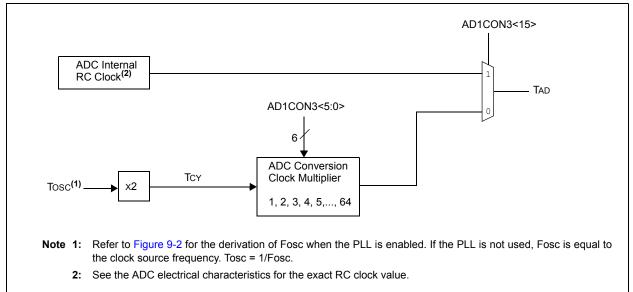

FIGURE 21-3: ADC CONVERSION CLOCK PERIOD BLOCK DIAGRAM

21.4 ADC Helpful Tips

- 1. The SMPI<3:0> (AD1CON2<5:2>) control bits:
 - a) Determine when the ADC interrupt flag is set and an interrupt is generated if enabled.
 - b) When the CSCNA bit (AD1CON2<10>) is set to '1', determines when the ADC analog scan channel list defined in the AD1CSSL/ AD1CSSH registers starts over from the beginning.
 - c) On devices without a DMA peripheral, determines when ADC result buffer pointer to ADC1BUF0-ADC1BUFF, gets reset back to the beginning at ADC1BUF0.
- On devices without a DMA module, the ADC has 16 result buffers. ADC conversion results are stored sequentially in ADC1BUF0-ADC1BUFF regardless of which analog inputs are being used subject to the SMPI<3:0> bits (AD1CON2<5:2>) and the condition described in 1c above. There is no relationship between the ANx input being measured and which ADC buffer (ADC1BUF0-ADC1BUFF) that the conversion results will be placed in.
- On devices with a DMA module, the ADC module has only 1 ADC result buffer, (i.e., ADC1BUF0), per ADC peripheral and the ADC conversion result must be read either by the CPU or DMA controller before the next ADC conversion is complete to avoid overwriting the previous value.
- 4. The DONE bit (AD1CON1<0>) is only cleared at the start of each conversion and is set at the completion of the conversion, but remains set indefinitely even through the next sample phase until the next conversion begins. If application code is monitoring the DONE bit in any kind of software loop, the user must consider this behavior because the CPU code execution is faster than the ADC. As a result, in manual sample mode, particularly where the users code is setting the SAMP bit (AD1CON1<1>), the DONE bit should also be cleared by the user application just before setting the SAMP bit.
- 5. On devices with two ADC modules, the ADCxPCFG registers for both ADC modules must be set to a logic '1' to configure a target I/O pin as a digital I/O pin. Failure to do so means that any alternate digital input function will always see only a logic '0' as the digital input buffer is held in Disable mode.

21.5 ADC Resources

Many useful resources related to ADC are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

Note: In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/ Devices.aspx?dDocName=en532311

1 = Port pin in Digital mode, port read input enabled, ADC input multiplexer connected to AVss

0 = Port pin in Analog mode, port read input disabled, ADC samples pin voltage

Note 1: On devices without 13 analog inputs, all PCFG bits are R/W by user software. However, the PCFG bits are ignored on ports without a corresponding input on device.

- **2:** PCFGx = ANx, where x = 0 through 12.
- **3:** PCFGx bits have no effect if ADC module is disabled by setting ADxMD bit in the PMDx Register. In this case all port pins multiplexed with ANx will be in Digital mode.

NOTES:

22.0 AUDIO DIGITAL-TO-ANALOG CONVERTER (DAC)

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 33. "Audio Digital-to-Analog Converter (DAC)" (DS70211) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Audio Digital-to-Analog Converter (DAC) module is a 16-bit Delta-Sigma signal converter designed for audio applications. It has two output channels, left and right to support stereo applications. Each DAC output channel provides three voltage outputs, positive DAC output, negative DAC output, and the midpoint voltage output for the dsPIC33FJ64GP804 and dsPIC33FJ128GP804 The devices. dsPIC33FJ128GP802 dsPIC33FJ64GP802 and devices provide positive DAC output and negative DAC output voltages.

22.1 Key Features

- 16-bit resolution (14-bit accuracy)
- Second-Order Digital Delta-Sigma Modulator
- 256 X Over-Sampling Ratio
- 128-Tap FIR Current-Steering Analog Reconstruction Filter
- 100 ksps Maximum Sampling Rate
- User controllable Sample Clock
- Input Frequency 45 kHz max
- · Differential Analog Outputs
- Signal-To-Noise: 90 dB
- · 4-deep input Buffer
- 16-bit Processor I/O, and DMA interfaces

22.2 DAC Module Operation

The functional block diagram of the Audio DAC module is shown in Figure 22-1. The Audio DAC module provides a 4-deep data input FIFO buffer for each output channel. If the DMA module and/or the processor cannot provide output data in a timely manner, and the FIFO becomes empty, the DAC accepts data from the DAC Default Data register (DACDFLT). This safety feature is useful for industrial control applications where the DAC output controls an important processor or machinery. The DACDFLT register should be initialized with a "safe" output value. Often the safe output value is either the midpoint value (0x8000) or a zero value (0x0000).

The digital interpolator up-samples the input signals, where the over-sampling ratio is 256x which creates data points between the user supplied data points. The interpolator also includes processing by digital filters to provide "noise shaping" to move the converter noise above 20 kHz (upper limit of the pass band). The output of the interpolator drives the Sigma-Delta modulator. The serial data bit stream from the Sigma-Delta modulator is processed by the reconstruction filter. The differential outputs of the reconstruction filter are amplified by Op Amps to provide the required peak-to-peak voltage swing.

Note: The DAC module is designed specifically for audio applications and is not recommended for control type applications.

22.3 DAC Output Format

The DAC output data stream can be in a two's complement signed number format or as an unsigned number format.

The Audio DAC module features the ability to accept the 16-bit input data in a two's complement signed number format or as an unsigned number format. The data formatting is controlled by the Data Format Control bit (FORM<8>) in the DAC1CON register. The supported formats are:

- 1 = Signed (two's complement)
- 0 = Unsigned

If the FORM bit is configured for "Unsigned data" then the user input data yields the following behavior:

- 0xFFFF = most positive output voltage
- 0x8000 = mid point output voltage
- 0x7FFF = a value just below the midpoint
- 0x0000 = minimum output voltage

If the FORM bit is configured for "signed data" then the user input data yields the following behavior:

- 0x7FFF = most positive output voltage
- 0x0000 = mid point output voltage
- 0xFFFF = value just below the midpoint
- 0x8000 = minimum output voltage

The Audio DAC provides an analog output proportional to the digital input value. The maximum 100,000 samples per second (100 ksps) update rate provides good quality audio reproduction.

22.4 DAC Clock

The DAC clock signal clocks the internal logic of the Audio DAC module. The data sample rate of the Audio DAC is an integer division of the rate of the DAC clock. The DAC clock is generated via a clock divider circuit that accepts an auxiliary clock from the auxiliary oscillator.

The divisor ratio is programmed by clock divider bits (DACFDIV<6:0>) in the DAC Control register (DAC1CON). The resulting DAC clock must not exceed 25.6 MHz. If lower sample rates are to be used, then the DAC filter clock frequency may be reduced to reduce power consumption. The DAC clock frequency is 256 times the sampling frequency.

23.0 COMPARATOR MODULE

- Note 1: This data sheet summarizes the features dsPIC33FJ32GP302/304. of the dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 34. "Comparator" (DS70212) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The Comparator module provides a set of dual input comparators. The inputs to the comparator can be configured to use any one of the four pin inputs (C1IN+, C1IN-, C2IN+ and C2IN-) as well as the Comparator Voltage Reference Input (CVREF).

Note: This peripheral contains output functions that may need to be configured by the peripheral pin select feature. For more information, see Section 11.6 "Peripheral Pin Select".

23.3 Comparator Voltage Reference

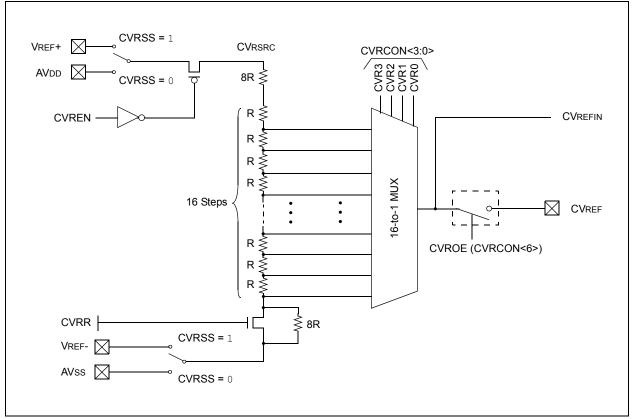

23.3.1 CONFIGURING THE COMPARATOR VOLTAGE REFERENCE

The voltage reference module is controlled through the CVRCON register (Register 23-2). The comparator voltage reference provides two ranges of output voltage, each with 16 distinct levels. The range to be used is selected by the CVRR bit (CVRCON<5>). The primary difference between the ranges is the size of the steps selected by the CVREF Selection bits (CVR3:CVR0), with one range offering finer resolution.

The comparator reference supply voltage can come from either VDD and VSS, or the external VREF+ and VREF-. The voltage source is selected by the CVRSS bit (CVRCON<4>).

The settling time of the comparator voltage reference must be considered when changing the CVREF output.

24.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 37. "Real-Time Clock and Calendar (RTCC)" (DS70301) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

This chapter discusses the Real-Time Clock and Calendar (RTCC) module, available on dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices, and its operation. The following are some of the key features of this module:

- Time: hours, minutes, and seconds
- 24-hour format (military time)
- · Calendar: weekday, date, month and year
- Alarm configurable
- Year range: 2000 to 2099
- Leap year correction
- · BCD format for compact firmware
- Optimized for low-power operation
- · User calibration with auto-adjust
- Calibration range: ±2.64 seconds error per month
- Requirements: External 32.768 kHz clock crystal
- Alarm pulse or seconds clock output on RTCC pin

The RTCC module is intended for applications where accurate time must be maintained for extended periods of time with minimum to no intervention from the CPU. The RTCC module is optimized for low-power usage to provide extended battery lifetime while keeping track of time.

The RTCC module is a 100-year clock and calendar with automatic leap year detection. The range of the clock is from 00:00:00 (midnight) on January 1, 2000 to 23:59:59 on December 31, 2099.

The hours are available in 24-hour (military time) format. The clock provides a granularity of one second with half-second visibility to the user.

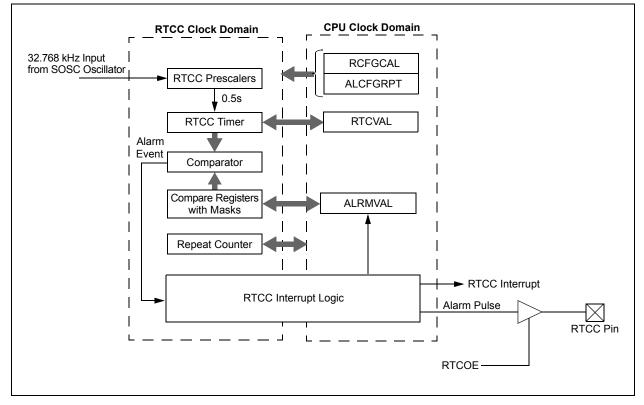

FIGURE 24-1: RTCC BLOCK DIAGRAM

24.1 RTCC Module Registers

The RTCC module registers are organized into three categories:

- RTCC Control Registers
- RTCC Value Registers
- Alarm Value Registers

24.1.1 REGISTER MAPPING

To limit the register interface, the RTCC Timer and Alarm Time registers are accessed through corresponding register pointers. The RTCC Value register window (RTCVALH and RTCVALL) uses the RTCPTR bits (RCFGCAL<9:8>) to select the desired timer register pair (see Table 24-1).

By writing the RTCVALH byte, the RTCC Pointer value, RTCPTR<1:0> bits, decrement by one until they reach '00'. Once they reach '00', the MINUTES and SECONDS value will be accessible through RTCVALH and RTCVALL until the pointer value is manually changed.

TABLE 24-1: RTCVAL REGISTER MAPPING

| RTCPTR | RTCC Value Register Window | | | | |
|--------|----------------------------|-------------|--|--|--|
| <1:0> | RTCVAL<15:8> | RTCVAL<7:0> | | | |
| 00 | MINUTES | SECONDS | | | |
| 01 | WEEKDAY | HOURS | | | |
| 10 | MONTH | DAY | | | |
| 11 | — | YEAR | | | |

The Alarm Value register window (ALRMVALH and ALRMVALL) uses the ALRMPTR bits (ALCFGRPT<9:8>) to select the desired Alarm register pair (see Table 24-2).

By writing the ALRMVALH byte, the Alarm Pointer value, ALRMPTR<1:0> bits, decrement by one until they reach '00'. Once they reach '00', the ALRMMIN and ALRMSEC value will be accessible through ALRMVALH and ALRMVALL until the pointer value is manually changed.

TABLE 24-2: ALRMVAL REGISTER MAPPING

| ALRMPTR | Alarm Value Register Window | | | | |
|---------|-----------------------------|--------------|--|--|--|
| <1:0> | ALRMVAL<15:8> | ALRMVAL<7:0> | | | |
| 00 | ALRMMIN | ALRMSEC | | | |
| 01 | ALRMWD | ALRMHR | | | |
| 10 | ALRMMNTH | ALRMDAY | | | |
| 11 | — | — | | | |

Considering that the 16-bit core does not distinguish between 8-bit and 16-bit read operations, the user must be aware that when reading either the ALRMVALH or ALRMVALL bytes will decrement the ALRMPTR<1:0> value. The same applies to the RTCVALH or RTCVALL bytes with the RTCPTR<1:0> being decremented.

| Note: | This only applies to read operations and |
|-------|------------------------------------------|
| | not write operations. |

24.1.2 WRITE LOCK

In order to perform a write to any of the RTCC Timer registers, the RTCWREN bit (RCFGCAL<13>) must be set (refer to Example 24-1).

Note: To avoid accidental writes to the timer, it is recommended that the RTCWREN bit (RCFGCAL<13>) is kept clear at any other time. For the RTCWREN bit to be set, there is only 1 instruction cycle time window allowed between the 55h/AA sequence and the setting of RTCWREN; therefore, it is recommended that code follow the procedure in Example 24-1.

EXAMPLE 24-1: SETTING THE RTCWREN BIT

| MOV | #NVMKEY, W1 | ;move the address of NVMKEY into W1 |
|------|--------------|-------------------------------------|
| MOV | #0x55, W2 | |
| MOV | #0xAA, W3 | |
| MOV | W2, [W1] | ;start 55/AA sequence |
| MOV | W3, [W1] | |
| BSET | RCFGCAL, #13 | ;set the RTCWREN bit |

24.2 RTCC Resources

Many useful resources related to RTCC are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

| Note: | In the event you are not able to access the product page using the link above, enter this URL in your browser: http://www.microchip.com/wwwproducts/ |

REGISTER 24-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER⁽¹⁾

2: A write to the RTCEN bit is only allowed when RTCWREN = 1.

3: This bit is read-only. It is cleared to '0' on a write to the lower half of the MINSEC register.

REGISTER 24-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER⁽¹⁾ (CONTINUED)

| CAL<7:0>: RTC Drift Calibration bits | | | | | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|--|--|
| 11111111 = Minimum negative adjustment; subtracts 4 RTC clock pulses every one minute | | | | | |
| • | | | | | |
| • | | | | | |
| • | | | | | |
| 10000000 = Maximum negative adjustment; subtracts 512 RTC clock pulses every one minute 01111111 = Maximum positive adjustment; adds 508 RTC clock pulses every one minute | | | | | |
| • | | | | | |
| • | | | | | |
| • | | | | | |
| 00000001 = Minimum positive adjustment; adds 4 RTC clock pulses every one minute 00000000 = No adjustment | | | | | |
| | | | | | |

Note 1: The RCFGCAL register is only affected by a POR.

- 2: A write to the RTCEN bit is only allowed when RTCWREN = 1.
- 3: This bit is read-only. It is cleared to '0' on a write to the lower half of the MINSEC register.

NOTES:

25.0 PROGRAMMABLE CYCLIC REDUNDANCY CHECK (CRC) GENERATOR

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304. dsPIC33FJ64GPX02/X04. and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet. refer to Section 36. "Programmable Cyclic Redundancy Check (CRC)" (DS70298) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

The programmable CRC generator offers the following features:

- User-programmable polynomial CRC equation
- Interrupt output
- Data FIFO

FIGURE 25-1: CRC SHIFTER DETAILS

25.1 Overview

The module implements a software configurable CRC generator. The terms of the polynomial and its length can be programmed using the CRCXOR bits (X<15:1>) and the CRCCON bits (PLEN<3:0>), respectively.

EQUATION 25-1: CRC EQUATION

$$x^{16} + x^{12} + x^5 + 1$$

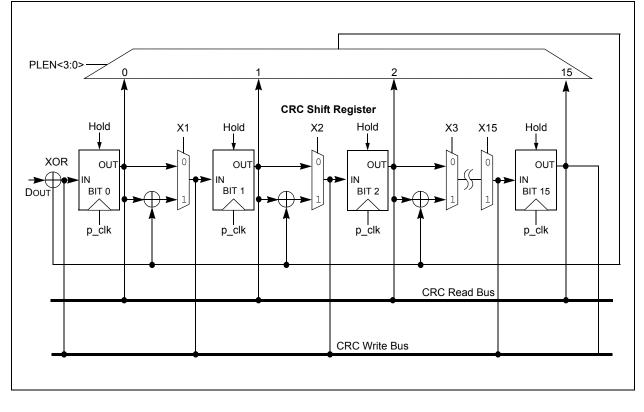

To program this polynomial into the CRC generator, the CRC register bits should be set as shown in Table 25-1.

| TABLE 25-1: | EXAMPLE CRC SETUP |
|-------------|-------------------|
|-------------|-------------------|

| Bit Name | Bit Value |
|-----------|----------------|
| PLEN<3:0> | 1111 |
| X<15:1> | 00010000010000 |

For the value of X<15:1>, the 12th bit and the 5th bit are set to '1', as required by the CRC equation. The 0th bit required by the CRC equation is always XORed. For a 16-bit polynomial, the 16th bit is also always assumed to be XORed; therefore, the X<15:1> bits do not have the 0th bit or the 16th bit.

The topology of a standard CRC generator is shown in Figure 25-2.

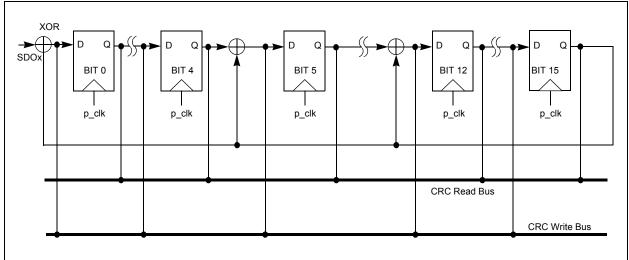

FIGURE 25-2: CRC GENERATOR RECONFIGURED FOR $x^{16} + x^{12} + x^5 + 1$

25.2 User Interface

25.2.1 DATA INTERFACE

To start serial shifting, a '1' must be written to the CRCGO bit.

The module incorporates a FIFO that is 8 deep when PLEN (PLEN<3:0>) > 7, and 16 deep, otherwise. The data for which the CRC is to be calculated must first be written into the FIFO. The smallest data element that can be written into the FIFO is one byte. For example, if PLEN = 5, then the size of the data is PLEN + 1 = 6. The data must be written as follows:

```
data[5:0] = crc_input[5:0]
data[7:6] = `bxx
```

Once data is written into the CRCWDAT MSb (as defined by PLEN), the value of VWORD (VWORD<4:0>) increments by one. The serial shifter starts shifting data into the CRC engine when CRCGO = 1 and VWORD > 0. When the MSb is shifted out, VWORD decrements by one. The serial shifter continues shifting until the VWORD reaches 0. Therefore, for a given value of PLEN, it will take (PLEN + 1) * VWORD number of clock cycles to complete the CRC calculations.

When VWORD reaches 8 (or 16), the CRCFUL bit will be set. When VWORD reaches 0, the CRCMPT bit will be set.

To continually feed data into the CRC engine, the recommended mode of operation is to initially "prime" the FIFO with a sufficient number of words so no interrupt is generated before the next word can be written. Once that is done, start the CRC by setting the CRCGO bit to '1'. From that point onward, the VWORD<4:0> bits should be polled. If they read less than 8 or 16, another word can be written into the FIFO. To empty words already written into a FIFO, the CRCGO bit must be set to '1' and the CRC shifter allowed to run until the CRCMPT bit is set.

Also, to get the correct CRC reading, it will be necessary to wait for the CRCMPT bit to go high before reading the CRCWDAT register.

If a word is written when the CRCFUL bit is set, the VWORD Pointer will roll over to 0. The hardware will then behave as if the FIFO is empty. However, the condition to generate an interrupt will not be met; therefore, no interrupt will be generated (See Section 25.2.2 "Interrupt Operation").

At least one instruction cycle must pass after a write to CRCWDAT before a read of the VWORD bits is done.

25.2.2 INTERRUPT OPERATION

When the VWORD<4:0> bits make a transition from a value of '1' to '0', an interrupt will be generated.

25.3 Operation in Power-Saving Modes

25.3.1 SLEEP MODE

If Sleep mode is entered while the module is operating, the module will be suspended in its current state until clock execution resumes.

25.3.2 IDLE MODE

To continue full module operation in Idle mode, the CSIDL bit must be cleared prior to entry into the mode.

If CSIDL = 1, the module will behave the same way as it does in Sleep mode; pending interrupt events will be passed on, even though the module clocks are not available.

25.4 Programmable CRC Resources

Many useful resources related to Programmable CRC are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

NOTES:

26.0 PARALLEL MASTER PORT (PMP)

- Note 1: This data sheet summarizes the features the dsPIC33FJ32GP302/304, of dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to Section 35. "Parallel Master (PMP)" (DS70299) Port of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com). 2: Some registers and associated bits
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

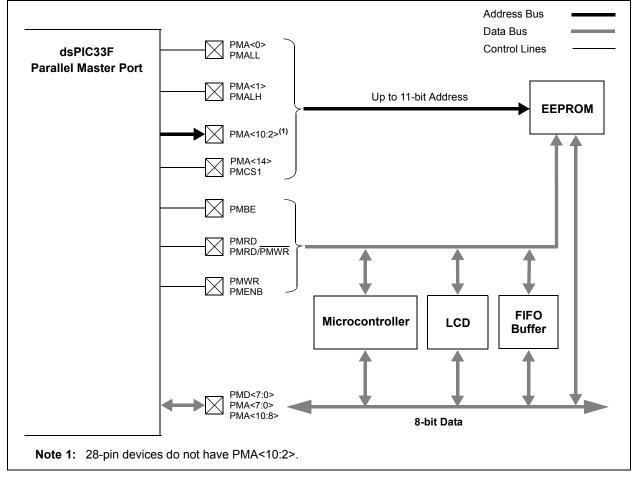

The Parallel Master Port (PMP) module is a parallel 8-bit I/O module, specifically designed to communicate with a wide variety of parallel devices, such as communication peripherals, LCDs, external memory

FIGURE 26-1: PMP MODULE OVERVIEW

devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP is highly configurable.

Key features of the PMP module include:

- · Fully multiplexed address/data mode
- Demultiplexed or partially multiplexed address/ data mode:
 - Up to 11 address lines with single chip select
 - Up to 12 address lines without chip select
- One Chip Select Line
- · Programmable Strobe Options
 - Individual Read and Write Strobes or;
 - Read/Write Strobe with Enable Strobe
- Address Auto-Increment/Auto-Decrement
- Programmable Address/Data Multiplexing
- Programmable Polarity on Control Signals
- · Legacy Parallel Slave Port Support
- Enhanced Parallel Slave Support:
 - Address Support
 - 4-Byte Deep Auto-Incrementing Buffer
- · Programmable Wait States
- · Selectable Input Voltage Levels

26.1 **PMP** Resources

Many useful resources related to PMP are provided on the main product page of the Microchip web site for the devices listed in this data sheet. This product page, which can be accessed using this link, contains the latest updates and additional information.

27.0 SPECIAL FEATURES

- Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC33F/PIC24H Family Reference Manual". Please see the Microchip web site (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual sections.
 - Some registers and associated bits described in this section may not be available on all devices. Refer to Section 4.0 "Memory Organization" in this data sheet for device-specific register and bit information.

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- · Flexible configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard[™] Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming[™] (ICSP[™])
- In-Circuit emulation

27.1 Configuration Bits

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices provide nonvolatile memory implementation for device configuration bits. Refer to **Section 25. "Device Configuration"** (DS70194), in the *"dsPIC33F/PIC24H Family Reference Manual"* for more information on this implementation.

The Configuration bits can be programmed (read as '0'), or left unprogrammed (read as '1'), to select various device configurations. These bits are mapped starting at program memory location 0xF80000.

The individual Configuration bit descriptions for the Configuration registers are shown in Table 27-2.

Note that address 0xF80000 is beyond the user program memory space. It belongs to the configuration memory space (0x800000-0xFFFFFF), which can only be accessed using table reads and table writes.

The Device Configuration register map is shown in Table 27-1.

Note 1: This Configuration register is not available on dsPIC33FJ32GP302/304 devices.

27.2 On-Chip Voltage Regulator

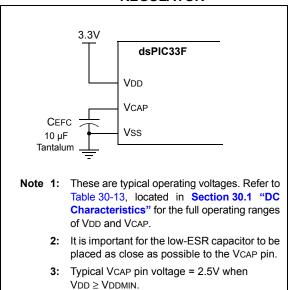

All of the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/ X04 devices power their core digital logic at a nominal 2.5V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. When the regulator is enabled, a low-ESR (less than 5 Ohms) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (Figure 27-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 30-13 located in Section 30.1 "DC Characteristics".

| Note: | It is important for the low-ESR capacitor to |
|-------|----------------------------------------------|
| | be placed as close as possible to the VCAP |
| | pin. |

On a POR, it takes approximately 20 µs for the on-chip voltage regulator to generate an output voltage. During this time, designated as TSTARTUP, code execution is disabled. TSTARTUP is applied every time the device resumes operation after any power-down.

FIGURE 27-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR^(1,2,3)

27.3 BOR: Brown-out Reset

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage VCAP. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines, or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source, based on the device Configuration bit values (FNOSC<2:0> and POSCMD<1:0>).

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON<5>) is '1'.

Concurrently, the PWRT time-out (TPWRT) is applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, then a nominal delay of TFSCM = 100 is applied. The total delay in this case is TFSCM.

The BOR Status bit (RCON<1>) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle modes and resets the device should VDD fall below the BOR threshold voltage.

27.4 Watchdog Timer (WDT)

For dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

27.4.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler than can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a nominal WDT time-out period (TWDT) of 1 ms in 5-bit mode, or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- · On any form of device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSC bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

All Device Resets Transition to New Clock Source Exit Sleep or Idle Mode PWRSAV Instruction CLRWDT Instruction Watchdog Timer Sleep/Idle WDTPRE WDTPOST<3:0> SWDTEN WDT Wake-up FWDTEN Prescaler Postscaler WDT LPRC Clock (divide by N1) (divide by N2) Reset WDT Window Select WINDIS CLRWDT Instruction

FIGURE 27-2: WDT BLOCK DIAGRAM

27.4.2 SLEEP AND IDLE MODES

If the WDT is enabled, it continues to run during Sleep or Idle modes. When the WDT time-out occurs, the device wakes the device and code execution continues from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bits (RCON<3,2>) needs to be cleared in software after the device wakes up.

27.4.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

| Note: | If the WINDIS bit (FWDT<6>) is cleared, the |
|-------|-----------------------------------------------|
| | CLRWDT instruction should be executed by |
| | the application software only during the last |
| | 1/4 of the WDT period. This CLRWDT win- |
| | dow can be determined by using a timer. If |
| | a CLRWDT instruction is executed before |
| | this window, a WDT Reset occurs. |
| | |

The WDT flag, WDTO bit (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

27.5 JTAG Interface

dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 devices implement a JTAG interface, which supports boundary scan device testing, as well as in-circuit programming. Detailed information on this interface is provided in future revisions of the document.

Note: Refer to Section 24. "Programming and Diagnostics" (DS70207) of the "dsPIC33F/PIC24H Family Reference Manual" for further information on usage, configuration and operation of the JTAG interface.

27.6 In-Circuit Serial Programming™ (ICSP)™

The dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/ X04, and dsPIC33FJ128GPX02/X04 devices can be serially programmed while in the end application circuit. This is done with two lines for clock and data and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the *"dsPIC33F/PIC24H Flash Programming Specification"* (DS70152) for details about In-Circuit Serial Programming (ICSP).

Any of the three pairs of programming clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

27.7 In-Circuit Debugger

When MPLAB[®] ICD 3 is selected as a debugger, the incircuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, VSS, PGC, PGD and the PGECx and PGEDx pin pairs. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

27.8 Code Protection and CodeGuard™ Security

The dsPIC33FJ64GPX02/X04 and dsPIC33FJ128GPX02/X04 devices offer advanced implementation of CodeGuard Security that supports BS, SS and GS while, the dsPIC33FJ32GP302/304 devices offer the intermediate level of CodeGuard Security that supports only BS and GS. CodeGuard Security enables multiple parties to securely share resources (memory, interrupts and peripherals) on a single chip. This feature helps protect individual Intellectual Property in collaborative system designs.

When coupled with software encryption libraries, CodeGuard Security can be used to securely update Flash even when multiple IPs reside on the single chip. The code protection features vary depending on the actual dsPIC33F implemented. The following sections provide an overview of these features.

Secure segment and RAM protection is implemented on the dsPIC33FJ64GPX02/X04 and dsPIC33FJ128GPX02/X04 devices. The dsPIC33FJ32GP302/304 devices do not support secure segment and RAM protection.

Note: Refer to Section 23. "CodeGuard™ Security" (DS70199) of the "*dsPIC33F/ PIC24H Family Reference Manual*" for further information on usage, configuration and operation of CodeGuard Security.

28.0 INSTRUCTION SET SUMMARY

| Note: | This data sheet summarizes the features | | | | |
|-------|----------------------------------------------|--|--|--|--|
| | of the dsPIC33FJ32GP302/304, | | | | |
| | dsPIC33FJ64GPX02/X04, and | | | | |
| | dsPIC33FJ128GPX02/X04 families of | | | | |
| | devices. It is not intended to be a compre- | | | | |
| | hensive reference source. To complement | | | | |
| | the information in this data sheet, refer to | | | | |
| | the "dsPIC33F/PIC24H Family Reference | | | | |
| | Manual". Please see the Microchip web | | | | |
| | site (www.microchip.com) for the latest | | | | |
| | reference manual sections. | | | | |

The dsPIC33F instruction set is identical to that of the dsPIC30F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- · Word or byte-oriented operations
- · Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 28-1shows the general symbols used indescribing the instructions.

The dsPIC33F instruction set summary in Table 28-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- · The file register specified by the value 'f'
- The destination, which could be either the file register 'f' or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/ shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The $\ensuremath{\mathtt{MAC}}$ class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- · The X and Y address space prefetch operations
- · The X and Y address space prefetch destinations
- · The accumulator write back destination

The other DSP instructions do not involve any multiplication and can include:

- · The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register 'Wn' or a literal value

The control instructions can use some of the following operands:

- · A program memory address
- The mode of the table read and table write instructions

Most instructions are a single word. Certain doubleword instructions are designed to provide all the required information in these 48 bits. In the second word, the 8 MSbs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the program counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all table reads and writes and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the *"16-bit MCU and DSC Programmer's Reference Manual"* (DS70157).

| TABLE 28-1: | SYMBOLS USED IN OPCODE DESCRIPTIONS |
|-------------|-------------------------------------|
|-------------|-------------------------------------|

| #text (text) [text] {} <n:m> .b .d .S</n:m> | Means literal defined by "text" Means "content of text" Means "the location addressed by text" Optional field or operation Register bit field Byte mode selection Double-Word mode selection Shadow register select Word mode selection (default) | |
|---------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| [text] {} <n:m> .b .d .S</n:m> | Means "the location addressed by text" Optional field or operation Register bit field Byte mode selection Double-Word mode selection Shadow register select | |
| {} <n:m> .b .d .S</n:m> | Optional field or operation Register bit field Byte mode selection Double-Word mode selection Shadow register select | |
| <n:m> .b .d .S</n:m> | Register bit field Byte mode selection Double-Word mode selection Shadow register select | |
| .b .d .S | Byte mode selection Double-Word mode selection Shadow register select | |
| .d .S | Double-Word mode selection Shadow register select | |
| .S | Shadow register select | |
| | · · | |
| | Word mode selection (default) | |
| .W | | |
| Acc | One of two accumulators {A, B} | |
| AWB | Accumulator write back destination address register \in {W13, [W13]+ = 2} | |
| bit4 | 4-bit bit selection field (used in word addressed instructions) ∈ {015} | |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero | |
| Expr | Absolute address, label or expression (resolved by the linker) | |
| f | File register address ∈ {0x00000x1FFF} | |
| lit1 | 1-bit unsigned literal ∈ {0,1} | |
| lit4 | 4-bit unsigned literal ∈ {015} | |
| lit5 | 5-bit unsigned literal ∈ {031} | |
| lit8 | 8-bit unsigned literal ∈ {0255} | |
| lit10 | 10-bit unsigned literal $\in~\{0255\}$ for Byte mode, {0:1023} for Word mode | |
| lit14 | 14-bit unsigned literal ∈ {016384} | |
| lit16 | 16-bit unsigned literal ∈ {065535} | |
| lit23 | 23-bit unsigned literal ∈ {08388608}; LSb must be '0' | |
| None | Field does not require an entry, can be blank | |
| OA, OB, SA, SB | DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate | |
| PC | Program Counter | |
| Slit10 | 10-bit signed literal \in {-512511} | |
| Slit16 | 16-bit signed literal ∈ {-3276832767} | |
| Slit6 | 6-bit signed literal \in {-1616} | |
| Wb | Base W register ∈ {W0W15} | |
| Wd | Destination W register ∈ { Wd, [Wd], [Wd++], [Wd], [++Wd], [Wd] } | |
| Wdo | Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd], [++Wnd], [Wnd], [Wnd+Wb] } | |
| Wm,Wn | Dividend, Divisor working register pair (direct addressing) | |

| Field | Description |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wm*Wm | Multiplicand and Multiplier working register pair for Square instructions ∈ {W4 * W4,W5 * W5,W6 * W6,W7 * W7} |
| Wm*Wn | Multiplicand and Multiplier working register pair for DSP instructions ∈ {W4 * W5,W4 * W6,W4 * W7,W5 * W6,W5 * W7,W6 * W7} |
| Wn | One of 16 working registers ∈ {W0W15} |
| Wnd | One of 16 destination working registers ∈ {W0W15} |
| Wns | One of 16 source working registers ∈ {W0W15} |
| WREG | W0 (working register used in file register instructions) |
| Ws | Source W register ∈ { Ws, [Ws], [Ws++], [Ws], [++Ws], [Ws] } |
| Wso | Source W register ∈ { Wns, [Wns], [Wns++], [Wns], [++Wns], [Wns], [Wns+Wb] } |
| Wx | X data space prefetch address register for DSP instructions ∈ {[W8] + = 6, [W8] + = 4, [W8] + = 2, [W8], [W8] - = 6, [W8] - = 4, [W8] - = 2, [W9] + = 6, [W9] + = 4, [W9] + = 2, [W9], [W9] - = 6, [W9] - = 4, [W9] - = 2, [W9 + W12], none} |

29.0 DEVELOPMENT SUPPORT

The PIC[®] microcontrollers and dsPIC[®] digital signal controllers are supported with a full range of software and hardware development tools:

- Integrated Development Environment
 - MPLAB[®] IDE Software
- Compilers/Assemblers/Linkers
 - MPLAB C Compiler for Various Device Families
 - HI-TECH C for Various Device Families
 - MPASM[™] Assembler
 - MPLINK[™] Object Linker/ MPLIB[™] Object Librarian
 - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
 - MPLAB SIM Software Simulator
- Emulators
 - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers
 - MPLAB ICD 3
 - PICkit[™] 3 Debug Express
- Device Programmers
 - PICkit[™] 2 Programmer
 - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits, and Starter Kits

29.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16/32-bit microcontroller market. The MPLAB IDE is a Windows[®] operating system-based application that contains:

- A single graphical interface to all debugging tools
 Simulator
 - Programmer (sold separately)
 - In-Circuit Emulator (sold separately)
 - In-Circuit Debugger (sold separately)
- · A full-featured editor with color-coded context
- · A multiple project manager
- Customizable data windows with direct edit of contents
- · High-level source code debugging
- · Mouse over variable inspection
- Drag and drop variables from source to watch windows
- · Extensive on-line help
- Integration of select third party tools, such as IAR C Compilers

The MPLAB IDE allows you to:

- Edit your source files (either C or assembly)
- One-touch compile or assemble, and download to emulator and simulator tools (automatically updates all project information)
- Debug using:
 - Source files (C or assembly)
 - Mixed C and assembly
 - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.

29.2 MPLAB C Compilers for Various Device Families

The MPLAB C Compiler code development systems are complete ANSI C compilers for Microchip's PIC18, PIC24 and PIC32 families of microcontrollers and the dsPIC30 and dsPIC33 families of digital signal controllers. These compilers provide powerful integration capabilities, superior code optimization and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

29.3 HI-TECH C for Various Device Families

The HI-TECH C Compiler code development systems are complete ANSI C compilers for Microchip's PIC family of microcontrollers and the dsPIC family of digital signal controllers. These compilers provide powerful integration capabilities, omniscient code generation and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

The compilers include a macro assembler, linker, preprocessor, and one-step driver, and can run on multiple platforms.

29.4 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel[®] standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

29.5 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler and the MPLAB C18 C Compiler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

29.6 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC devices. MPLAB C Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- · Support for the entire device instruction set
- · Support for fixed-point and floating-point data
- · Command line interface
- · Rich directive set
- Flexible macro language
- MPLAB IDE compatibility

29.7 MPLAB SIM Software Simulator

The MPLAB SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC[®] DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB SIM Software Simulator fully supports symbolic debugging using the MPLAB C Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

29.8 MPLAB REAL ICE In-Circuit Emulator System

MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs PIC[®] Flash MCUs and dsPIC[®] Flash DSCs with the easy-to-use, powerful graphical user interface of the MPLAB Integrated Development Environment (IDE), included with each kit.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with incircuit debugger systems (RJ11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB IDE. In upcoming releases of MPLAB IDE, new devices will be supported, and new features will be added. MPLAB REAL ICE offers significant advantages over competitive emulators including low-cost, full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, a ruggedized probe interface and long (up to three meters) interconnection cables.

29.9 MPLAB ICD 3 In-Circuit Debugger System

MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost effective high-speed hardware debugger/programmer for Microchip Flash Digital Signal Controller (DSC) and microcontroller (MCU) devices. It debugs and programs PIC[®] Flash microcontrollers and dsPIC[®] DSCs with the powerful, yet easyto-use graphical user interface of MPLAB Integrated Development Environment (IDE).

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

29.10 PICkit 3 In-Circuit Debugger/ Programmer and PICkit 3 Debug Express

The MPLAB PICkit 3 allows debugging and programming of PIC[®] and dsPIC[®] Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB Integrated Development Environment (IDE). The MPLAB PICkit 3 is connected to the design engineer's PC using a full speed USB interface and can be connected to the target via an Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the reset line to implement in-circuit debugging and In-Circuit Serial Programming[™] (ICSP)[™].

The PICkit 3 Debug Express include the PICkit 3, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

29.11 PICkit 2 Development Programmer/Debugger and PICkit 2 Debug Express

The PICkit[™] 2 Development Programmer/Debugger is a low-cost development tool with an easy to use interface for programming and debugging Microchip's Flash families of microcontrollers. The full featured Windows[®] programming interface supports baseline PIC16F5xx), (PIC10F, PIC12F5xx, midrange (PIC12F6xx, PIC16F), PIC18F, PIC24, dsPIC30, dsPIC33, and PIC32 families of 8-bit, 16-bit, and 32-bit microcontrollers, and many Microchip Serial EEPROM products. With Microchip's powerful MPLAB Integrated Development Environment (IDE) the PICkit[™] 2 in-circuit debugging on most PIC® enables microcontrollers. In-Circuit-Debugging runs, halts and single steps the program while the PIC microcontroller is embedded in the application. When halted at a breakpoint, the file registers can be examined and modified.

The PICkit 2 Debug Express include the PICkit 2, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

29.12 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular, detachable socket assembly to support various package types. The ICSP™ cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an MMC card for file storage and data applications.

29.13 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM[™] and dsPICDEM[™] demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ[®] security ICs, CAN, IrDA[®], PowerSmart battery management, SEEVAL[®] evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

30.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 electrical characteristics. Additional information is provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 family are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| Ambient temperature under bias | 40°C to +125°C |
|-----------------------------------------------------------------------------------|----------------------|
| Storage temperature | 65°C to +160°C |
| Voltage on VDD with respect to Vss | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant with respect to Vss ⁽⁴⁾ | 0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to Vss when $VDD \ge 3.0V^{(4)}$ | -0.3V to +5.6V |
| Voltage on any 5V tolerant pin with respect to Vss when VDD < 3.0V ⁽⁴⁾ | -0.3V to 3.6V |
| Maximum current out of Vss pin | |
| Maximum current into VDD pin ⁽²⁾ | |
| Maximum current sourced/sunk by any 2x I/O pin ⁽³⁾ | 8 mA |
| Maximum current sourced/sunk by any 4x I/O pin ⁽³⁾ | 15 mA |
| Maximum current sourced/sunk by any 8x I/O pin ⁽³⁾ | |
| Maximum current sunk by all ports | |
| Maximum current sourced by all ports ⁽²⁾ | 200 mA |

- **Note 1:** Stresses above those listed under "Absolute Maximum Ratings" can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.
 - 2: Maximum allowable current is a function of device maximum power dissipation (see Table 30-2).
 - 3: Exceptions are CLKOUT, which is able to sink/source 25 mA, and the VREF+, VREF-, SCLx, SDAx, PGECx and PGEDx pins, which are able to sink/source 12 mA.
 - 4: See the "Pin Diagrams" section for 5V tolerant pins.

30.1 DC Characteristics

TABLE 30-1: OPERATING MIPS VS. VOLTAGE

| | | | Max MIPS |
|----------------|-------------------------|-----------------------|-----------------------------------------------------------------------------|
| Characteristic | VDD Range (in Volts) | Temp Range (in °C) | dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 |
| _ | 3.0-3.6V ⁽¹⁾ | -40°C to +85°C | 40 |
| | 3.0-3.6V ⁽¹⁾ | -40°C to +125°C | 40 |

Note 1: Device is functional at VBORMIN < VDD < VDDMIN. Analog modules such as the ADC will have degraded performance. Device functionality is tested but not characterized. Refer to parameter BO10 in Table 30-11 for the minimum and maximum BOR values.

TABLE 30-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Тур | Мах | Unit |
|---------------------------------------------------------------------------------------------------|----------------|-----|-------------|------|------|
| Industrial Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | _ | +125 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +85 | °C |
| Extended Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +155 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +125 | °C |
| Power Dissipation: Internal chip power dissipation: $PINT = VDD \ x \ (IDD - \Sigma \ IOH)$ | PD PINT + PI/O | | | | W |
| I/O Pin Power Dissipation: I/O = Σ ({VDD - VOH} x IOH) + Σ (VOL x IOL) | | | | | |
| Maximum Allowed Power Dissipation | PDMAX | (| TJ — TA)/θJ | IA | W |

TABLE 30-3: THERMAL PACKAGING CHARACTERISTICS

| Characteristic | Symbol | Тур | Мах | Unit | Note |
|------------------------------------------|--------|-----|-----|------|------|
| Package Thermal Resistance, 44-pin QFN | θja | 30 | _ | °C/W | 1 |
| Package Thermal Resistance, 44-pin TFQP | θја | 40 | _ | °C/W | 1 |
| Package Thermal Resistance, 28-pin SPDIP | θја | 45 | _ | °C/W | 1 |
| Package Thermal Resistance, 28-pin SOIC | θја | 50 | _ | °C/W | 1 |
| Package Thermal Resistance, 28-pin QFN-S | θја | 30 | — | °C/W | 1 |

Note 1: Junction to ambient thermal resistance, Theta-JA (θ JA) numbers are achieved by package simulations.

TABLE 30-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

TABLE 30-5: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

Note 1: IDD is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows:

• Oscillator is configured in EC mode, no PLL until 10 MIPS, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)

- · CLKO is configured as an I/O input pin in the Configuration word
- · All I/O pins are configured as inputs and pulled to Vss
- MCLR = VDD, WDT and FSCM are disabled
- CPU, SRAM, program memory and data memory are operational
- No peripheral modules are operating; however, every peripheral is being clocked (defined PMDx bits are set to zero)
- CPU executing while (1) statement
- JTAG is disabled
- 2: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.
- **3:** These parameters are characterized but not tested in manufacturing.

TABLE 30-6: DC CHARACTERISTICS: IDLE CURRENT (lidle)

Note 1: Base IIDLE current is measured as follows:

 CPU core is off (i.e., Idle mode), oscillator is configured in EC mode and external clock active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)

- · CLKO is configured as an I/O input pin in the Configuration word
- External Secondary Oscillator disabled (i.e., SOSCO and SOSCI pins configured as digital I/O inputs)
- All I/O pins are configured as inputs and pulled to Vss
- MCLR = VDD, WDT and FSCM are disabled
- No peripheral modules are operating; however, every peripheral is being clocked (defined PMDx bits are set to zero)
- JTAG is disabled
- 2: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.
- 3: These parameters are characterized but not tested in manufacturing.

| TADLE 30-7: | | ACTERIS | 1103: 50% | | CURREN | I (IPD) | | | |

TABLE 30-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated.

2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current can be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: See the "Pin Diagrams" section for the 5V tolerant I/O pins.

5: VIL source < (Vss - 0.3). Characterized but not tested.

6: Non-5V tolerant pins VIH source > (VDD + 0.3), 5V tolerant pins VIH source > 5.5V. Characterized but not tested.

7: Digital 5V tolerant pins cannot tolerate any "positive" input injection current from input sources > 5.5V.

8: Injection currents > | 0 | can affect the ADC results by approximately 4-6 counts.

9: Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the mathematical "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

| D138b | Tww | Word Write Cycle Time | 41.1 | - | 57.6 | μs | Tww = 355 FRC cycles, Ta = +125°C, See Note 2 | | |

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated.

2: Other conditions: FRC = 7.37 MHz, TUN<5:0> = b'011111 (for Min), TUN<5:0> = b'100000 (for Max). This parameter depends on the FRC accuracy (see Table 30-19) and the value of the FRC Oscillator Tuning register (see Register 9-4). For complete details on calculating the Minimum and Maximum time see Section 5.3 "Programming Operations".

TABLE 30-13: INTERNAL VOLTAGE REGULATOR SPECIFICATIONS

| OS25 | TCY | Instruction Cycle Time ⁽²⁾ | 25 | | DC | ns | — | |
| OS30 | TosL, TosH | External Clock in (OSC1) High or Low Time | 0.375 x Tosc | — | 0.625 x Tosc | ns | EC | |
| OS31 | TosR, TosF | External Clock in (OSC1) Rise or Fall Time | — | — | 20 | ns | EC | |
| OS40 | TckR | CLKO Rise Time ⁽³⁾ | _ | 5.2 | _ | ns | _ | |
| OS41 | TckF | CLKO Fall Time ⁽³⁾ | — | 5.2 | — | ns | — | |
| OS42 | Gм | External Oscillator Transconductance ⁽⁴⁾ | 14 | 16 | 18 | mA/V | VDD = 3.3V TA = +25°C | |

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated.

2: Instruction cycle period (TCY) equals two times the input oscillator time-base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the "max." cycle time limit is "DC" (no clock) for all devices.

- 3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.
- 4: Data for this parameter is Preliminary. This parameter is characterized, but not tested in manufacturing.

| АС СНА | AC CHARACTERISTICS | | | $\begin{array}{llllllllllllllllllllllllllllllllllll$ | | | | | | |

TABLE 30-17: PLL CLOCK TIMING SPECIFICATIONS (VDD = 3.0V TO 3.6V)

Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: These parameters are characterized by similarity, but are not tested in manufacturing. This specification is based on clock cycle by clock cycle measurements. To calculate the effective jitter for individual time bases or communication clocks use this formula:

$$Peripheral Clock Jitter = \frac{DCLK}{\sqrt{\frac{FOSC}{Peripheral Bit Rate Clock}}}$$

For example: Fosc = 32 MHz, DCLK = 3%, SPI bit rate clock, (i.e., SCK) is 2 MHz.

$$SPI SCK Jitter = \left\lfloor \frac{D_{CLK}}{\sqrt{\left(\frac{32 \ MHz}{2 \ MHz}\right)}} \right\rfloor = \left\lfloor \frac{3\%}{\sqrt{16}} \right\rfloor = \left\lfloor \frac{3\%}{4} \right\rfloor = 0.75\%$$

TABLE 30-38: DCI MODULE (MULTI-CHANNEL, I²S MODES) TIMING REQUIREMENTS

Note 1: These parameters are characterized but not tested in manufacturing.

2: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: The minimum clock period for CSCK is 100 ns. Therefore, the clock generated in Master mode must not violate this specification.

31.0 HIGH TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40° C to $+150^{\circ}$ C are identical to those shown in **Section 30.0 "Electrical Characteristics"** for operation between -40° C to $+125^{\circ}$ C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, parameter DC10 in **Section 30.0 "Electrical Characteristics**" is the Industrial and Extended temperature equivalent of HDC10.

Absolute maximum ratings for the dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 high temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| Ambient temperature under bias ⁽⁴⁾ | 40°C to +150°C |
|-------------------------------------------------------------------------------|----------------------|
| Storage temperature | 65°C to +160°C |
| Voltage on VDD with respect to Vss | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant with respect to Vss ⁽⁵⁾ | 0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to Vss when $VDD < 3.0V^{(5)}$ | 0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to Vss when $VDD \ge 3.0V^{(5)}$ | 0.3V to 5.6V |
| Maximum current out of Vss pin | 60 mA |
| Maximum current into Vod pin ⁽²⁾ | 60 mA |
| Maximum junction temperature | |
| Maximum current sourced/sunk by any 2x I/O pin ⁽³⁾ | 2 mA |
| Maximum current sourced/sunk by any 4x I/O pin ⁽³⁾ | 4 mA |
| Maximum current sourced/sunk by any 8x I/O pin ⁽³⁾ | 8 mA |
| Maximum current sunk by all ports combined | 70 mA |
| Maximum current sourced by all ports combined ⁽²⁾ | 70 mA |

- **Note 1:** Stresses above those listed under "Absolute Maximum Ratings" can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.
 - 2: Maximum allowable current is a function of device maximum power dissipation (see Table 31-2).
 - **3:** Unlike devices at 125°C and below, the specifications in this section also apply to the CLKOUT, VREF+, VREF-, SCLx, SDAx, PGCx, and PGDx pins.
 - 4: AEC-Q100 reliability testing for devices intended to operate at 150°C is 1,000 hours. Any design in which the total operating time from 125°C to 150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.
 - 5: Refer to the "Pin Diagrams" section for 5V tolerant pins.

31.1 High Temperature DC Characteristics

TABLE 31-1: OPERATING MIPS VS. VOLTAGE

| | | | Max MIPS |
|----------------|-----------------------------|------------------------------|-----------------------------------------------------------------------------|
| Characteristic | VDD Range (in Volts) | Temperature Range (in °C) | dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 |
| | 3.0V to 3.6V ⁽¹⁾ | -40°C to +150°C | 20 |

Note 1: Device is functional at VBORMIN < VDD < VDDMIN. Analog modules such as the ADC will have degraded performance. Device functionality is tested but not characterized.

TABLE 31-2: THERMAL OPERATING CONDITIONS

2: Programming of the Flash memory is allowed up to 150°C.

31.2 AC Characteristics and Timing Parameters

The information contained in this section defines dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 AC characteristics and timing parameters for high temperature devices. However, all AC timing specifications in this section are the same as those in Section 30.2 "AC Characteristics and Timing Parameters", with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, parameter OS53 in Section 30.2 "AC Characteristics and Timing Parameters" is the Industrial and Extended temperature equivalent of HOS53.

TABLE 31-8: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

NOTES:

32.0 DC AND AC DEVICE CHARACTERISTICS GRAPHS

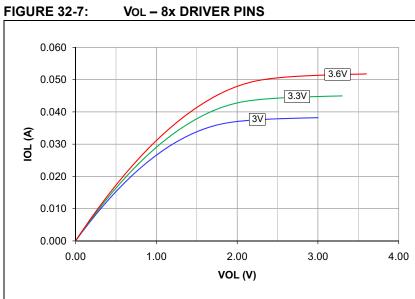

Note: The graphs provided following this note are a statistical summary based on a limited number of samples and are provided for design guidance purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

APPENDIX A: REVISION HISTORY

Revision A (September 2007)

This is the initial released version of this document.

Revision B (March 2008)

This revision includes minor typographical and formatting changes throughout the data sheet text. In addition, redundant information was removed that is now available in the respective chapters of the *dsPIC33F/PIC24H Family Reference Manual*, which can be obtained from the Microchip website (www.microchip.com).

The major changes are referenced by their respective section in the following table.

TABLE A-1: MAJOR SECTION UPDATES

| Section Name | Update Description |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| "High-Performance, 16-bit Digital Signal Controllers" | Note 1 added to all pin diagrams (see "Pin Diagrams"). |
| | Add External Interrupts column and Note 3 to the "dsPIC33FJ32GP302/304, dsPIC33FJ64GPX02/X04, and dsPIC33FJ128GPX02/X04 Controller Families" table. |
| Section 1.0 "Device Overview" | Updated parameters PMA0, PMA1, and PMD0 through PMPD7 (Table 1-1). |
| Section 6.0 "Interrupt Controller" | IFS0-IFSO4 changed to IFSx (see Section 6.3.2 "IFSx"). |
| | IEC0-IEC4 changed to IECx (see Section 6.3.3 "IECx"). |
| | IPC0-IPC19 changed to IPCx (see Section 6.3.4 "IPCx"). |
| Section 7.0 "Direct Memory Access (DMA)" | Updated parameter PMP (see Table 7-1). |
| Section 8.0 "Oscillator Configuration" | Updated the third clock source item (External Clock) in Section 8.1.1 "System Clock Sources". |
| | Updated TUN<5:0> (OSCTUN<5:0>) bit description (see Register 8-4). |
| Section 20.0 "10-bit/12-bit Analog-to-Digital Converter (ADC1)" | Added Note 2 to Figure 20-3. |
| Section 26.0 "Special Features" | Added Note 2 to Figure 26-1. |
| | Added Note after second paragraph in Section 26.2 "On-Chip Voltage Regulator". |
| Section 29.0 "Electrical Characteristics" | Updated Max MIPS for temperature range of -40°C to +125°C in Table 29-1. |
| | Updated typical values in Thermal Packaging Characteristics in Table 29-3. |
| | Added parameters DI11 and DI12 to Table 29-9. |
| | Updated minimum values for parameters D136 (TRw) and D137 (TPE) and removed typical values in Table 29-12. |
| | Added Extended temperature range to Table 29-13. |
| | Updated parameter AD63 and added Note 3 to Table 29-40 and Table 29-41. |

Revision C (May 2009)

This revision includes minor typographical and formatting changes throughout the data sheet text.

Global changes include:

- Changed all instances of OSCI to OSC1 and OSCO to OSC2
- Changed all instances of VDDCORE and VDDCORE/ VCAP to VCAP/VDDCORE

The other changes are referenced by their respective section in the following table.

TABLE A-2: MAJOR SECTION UPDATES

| Section Name | Update Description |
|-------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| High-Performance, 16-bit Digital Signal Controllers | Updated all pin diagrams to denote the pin voltage tolerance (see "Pin Diagrams"). |
| | Added Note 2 to the 28-Pin QFN-S and 44-Pin QFN pin diagrams, which references pin connections to Vss. |
| Section 1.0 "Device Overview" | Updated AVDD in the PINOUT I/O Descriptions (see Table 1-1). |
| | Added Peripheral Pin Select (PPS) capability column to Pinout I/O Descriptions (see Table 1-1). |
| Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers" | Added new section to the data sheet that provides guidelines on getting started with 16-bit Digital Signal Controllers. |
| Section 3.0 "CPU" | Updated CPU Core Block Diagram with a connection from the DSP Engine to the Y Data Bus (see Figure 3-1). |
| | Vertically extended the X and Y Data Bus lines in the DSP Engine Block Diagram (see Figure 3-3). |
| Section 4.0 "Memory Organization" | Updated Reset value for CORCON in the CPU Core Register Map (see Table 4-1). |
| | Updated the Reset values for IPC14 and IPC15 and removed the FLTA1IE bit (IEC3) from the Interrupt Controller Register Map (see Table 4-4). |
| | Updated bit locations for RPINR25 in the Peripheral Pin Select Input Register Map (see Table 4-21). |
| | Updated the Reset value for CLKDIV in the System Control Register Map (see Table 4-33). |
| Section 5.0 "Flash Program Memory" | Updated Section 5.3 "Programming Operations" with programming time formula. |
| Section 9.0 "Oscillator Configuration" | Updated the Oscillator System Diagram and added Note 2 (see Figure 9-1). |
| Comgulation | Added Note 1 and Note 2 to the OSCON register (see Register 9-1). |
| | Updated default bit values for DOZE<2:0> and FRCDIV<2:0> in the Clock Divisor (CLKDIV) Register (see Register 9-2). |
| | Added a paragraph regarding FRC accuracy at the end of Section 9.1.1 " System Clock Sources ". |
| | Added Note 3 to Section 9.2.2 "Oscillator Switching Sequence". |
| | Added Note 1 to the FRC Oscillator Tuning (OSCTUN) Register (see Register 9-4). |

| TABLE A-2: MAJOR SECTION Section Name | UPDATES (CONTINUED) |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | Update Description |
| Section 10.0 "Power-Saving Features" | Added the following registers: PMD1: Peripheral Module Disable Control Register 1 (Register 10-1) PMD2: Peripheral Module Disable Control Register 2 (Register 10-2) PMD3: Peripheral Module Disable Control Register 3 (Register 10-3) |
| Section 11.0 "I/O Ports" | Removed Table 11-1 and added reference to pin diagrams for I/O pin availability and functionality. Added paragraph on ADPCFG register default values to Section 11.3 " Configuring Analog Port Pins ". Added Note box regarding PPS functionality with input mapping to |
| | Section 11.6.2.1 "Input Mapping". |
| Section 16.0 "Serial Peripheral Interface (SPI)" | Added Note 2 and 3 to the SPIxCON1 register (see Register 16-2). |
| Section 18.0 "Universal Asynchronous Receiver Transmitter (UART)" | Updated the Notes in the UxMODE register (see Register 18-1). Updated the UTXINV bit settings in the UxSTA register and added Note 1 (see Register 18-2). |
| Section 19.0 "Enhanced CAN (ECAN™) Module" | Changed bit 11 in the ECAN Control Register 1 (CiCTRL1) to Reserved (see Register 19-1). |
| Section 21.0 "10-bit/12-bit Analog- to-Digital Converter (ADC)" | Replaced the ADC1 Module Block Diagrams with new diagrams (see Figure 21-1 and Figure 21-2). |
| | Updated bit values for ADCS<7:0> and added Notes 1 and 2 to the ADC1 Control Register 3 (AD1CON3) (see Register 21-3). |
| | Added Note 2 to the ADC1 Input Scan Select Register Low (AD1CSSL) (see Register 21-7). |
| | Added Note 2 to the ADC1 Port Configuration Register Low (AD1PCFGL) (see Register 21-8). |
| Section 22.0 "Audio Digital-to- Analog Converter (DAC)" | Updated the midpoint voltage in the last sentence of the first paragraph. Updated the voltage swing values in the last sentence of the last paragraph in Section 22.3 "DAC Output Format" . |
| Section 23.0 "Comparator Module" | Updated the Comparator Voltage Reference Block Diagram (see Figure 23-2). |
| Section 24.0 "Real-Time Clock and Calendar (RTCC)" | Updated the minimum positive adjust value for CAL<7:0> in the RTCC Calibration and Configuration (RCFGCAL) Register (see Register 24-1). |
| Section 27.0 "Special Features" | Added Note 1 to the Device Configuration Register Map (see Table 27-1). Updated Note 1 in the dsPIC33F Configuration Bits Description (see Table 27-2). |

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Section 30.0 "Electrical Characteristics" | Updated Typical values for Thermal Packaging Characteristics (see Table 30-3). |
| | Updated Min and Max values for parameter DC12 (RAM Data Retention Voltage) and added Note 4 (see Table 30-4). |
| | Updated Power-Down Current Max values for parameters DC60b and DC60c (see Table 30-7). |
| | Updated Characteristics for I/O Pin Input Specifications and added parameter DI21 (see Table 30-9). |
| | Updated Program Memory values for parameters 136, 137, and 138 (renamed to 136a, 137a, and 138a), added parameters 136b, 137b, and 138b, and added Note 2 (see Table 30-12). |
| | Added parameter OS42 (Gм) to the External Clock Timing Requirements (see Table 30-16). |
| | Updated Watchdog Timer Time-out Period parameter SY20 (see Table 30-21). |
| | Updated the IREF Current Drain parameter AD08 (see Table 30-37). |
| | Updated parameters AD30a, AD31a, AD32a, AD33a, and AD34a (see Table 30-38) |
| | Updated parameters AD30b, AD31b, AD32b, AD33b, and AD34b (see Table 30-39) |

TABLE A-2: MAJOR SECTION UPDATES (CONTINUED)

Revision D (November 2009)

The revision includes the following global update:

• Added Note 2 to the shaded table that appears at the beginning of each chapter. This new note provides information regarding the availability of registers and their associated bits

This revision also includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE A-3: MAJOR SECTION UPDATES

| Section Name | Update Description |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| "High-Performance, 16-bit Digital Signal Controllers" | Added information on high temperature operation (see "Operating Range: "). |
| Section 11.0 "I/O Ports" | Changed the reference to digital-only pins to 5V tolerant pins in the second paragraph of Section 11.2 " Open-Drain Configuration ". |
| Section 18.0 "Universal Asynchronous Receiver Transmitter (UART)" | Updated the two baud rate range features to: 10 Mbps to 38 bps at 40 MIPS. |
| Section 21.0 "10-bit/12-bit Analog-to-Digital Converter (ADC)" | Updated the ADC block diagrams (see Figure 21-1 and Figure 21-2). |
| Section 22.0 "Audio Digital-to-Analog Converter (DAC)" | Removed last sentence of the first paragraph in the section. Added a shaded note to Section 22.2 "DAC Module Operation" . Updated Figure 22-2: "Audio DAC Output for Ramp Input (Unsigned)". |
| Section 27.0 "Special Features" | Updated the second paragraph and removed the fourth paragraph in Section 27.1 "Configuration Bits" . Updated the Device Configuration Register Map (see Table 27-1). |
| Section 30.0 "Electrical Characteristics" | Updated the Absolute Maximum Ratings for high temperature and added Note 4. |
| | Removed parameters DI26, DI28, and DI29 from the I/O Pin Input Specifications (see Table 30-9). |
| | Updated the SPIx Module Slave Mode (CKE = 1) Timing Characteristics (see Figure 30-12). |
| | Removed Table 30-43: Audio DAC Module Specifications. Original contents were updated and combined with Table 30-42 of the same name. |
| Section 31.0 "High Temperature Electrical Characteristics" | Added new chapter with high temperature specifications. |
| "Product Identification System" | Added the "H" definition for high temperature. |

Revision E (January 2011)

This includes typographical and formatting changes throughout the data sheet text. In addition, the Preliminary marking in the footer was removed.

All instances of VDDCORE have been removed.

All other major changes are referenced by their respective section in the following table.

TABLE A-4: MAJOR SECTION UPDATES

| Section Name | Update Description |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| "High-Performance, 16-bit Digital Signal Controllers" | The high temperature end range was updated to +150°C (see "Operating Range: "). |
| Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers" | Updated the title of Section 2.3 "CPU Logic Filter Capacitor Connection (VCAP)". |
| | The frequency limitation for device PLL start-up conditions was updated in Section 2.7 "Oscillator Value Conditions on Device Start-up ". |
| | The second paragraph in Section 2.9 "Unused I/Os" was updated. |
| Section 4.0 "Memory Organization" | The All Resets values for the following SFRs in the Timer Register Map were changed (see Table 4-5): |
| | • TMR1 |
| | • TMR2 |
| | • TMR3 |
| | • TMR4 |
| | • TMR5 |
| Section 9.0 "Oscillator Configuration" | Added Note 3 to the OSCCON: Oscillator Control Register (see Register 9-1). |
| | Added Note 2 to the CLKDIV: Clock Divisor Register (see Register 9-2). |
| | Added Note 1 to the PLLFBD: PLL Feedback Divisor Register (see Register 9-3). |
| | Added Note 2 to the OSCTUN: FRC Oscillator Tuning Register (see Register 9-4). |
| | Added Note 1 to the ACLKCON: Auxiliary Control Register (see Register 9-5). |
| Section 21.0 "10-bit/12-bit Analog-to-Digital Converter (ADC)" | Updated the VREFL references in the ADC1 module block diagrams (see Figure 21-1 and Figure 21-2). |
| Section 27.0 "Special Features" | Added a new paragraph and removed the third paragraph in Section 27.1 "Configuration Bits" . |
| | Added the column "RTSP Effects" to the dsPIC33F Configuration Bits Descriptions (see Table 27-2). |

| Section Name | Update Description |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Section 30.0 "Electrical Characteristics" | Updated the maximum value for Extended Temperature Devices in the Thermal Operating Conditions (see Table 30-2). |
| | Removed Note 4 from the DC Temperature and Voltage Specifications (see Table 30-4). |
| | Updated all typical and maximum Operating Current (IDD) values (see Table 30-5). |
| | Updated all typical and maximum Idle Current (IIDLE) values (see Table 30-6). |
| | Updated the maximum Power-Down Current (IPD) values for parameters DC60d, DC60a, and DC60b (see Table 30-7). |
| | Updated all typical Doze Current (Idoze) values (see Table 30-8). |
| | Updated the maximum value for parameter DI19 and added parameters DI28, DI29, DI60a, DI60b, and DI60c to the I/O Pin Inpu Specifications (see Table 30-9). |
| | Removed Note 2 from the AC Characteristics: Internal RC Accuracy (see Table 30-18). |
| | Added Note 2 to the PLL Clock Timing Specifications (see Table 30-17) |
| | Updated the Internal RC Accuracy minimum and maximum values for parameter F21b (see Table 30-19). |
| | Updated the characteristic description for parameter DI35 in the I/O Timing Requirements (see Table 30-20). |
| | Updated <i>all</i> SPI specifications (see Table 30-28 through Table 30-38 and Figure 30-9 through Figure 30-16) |
| | Updated the ADC Module Specification minimum values for parameters AD05 and AD07, and updated the maximum value for parameter AD06 (see Table 30-41). |
| | Updated the ADC Module Specifications (12-bit Mode) minimum and maximum values for parameter AD21a (see Table 30-42). |
| | Updated all ADC Module Specifications (10-bit Mode) values, with the exception of Dynamic Performance (see Table 30-43). |
| | Updated the minimum value for parameter PM6 and the maximum value for parameter PM7 in the Parallel Master Port Read Timing Requirements (see Table 30-52). |
| | Added DMA Read/Write Timing Requirements (see Table 30-54). |

TABLE A-4: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| Section 31.0 "High Temperature Electrical Characteristics" | Updated all ambient temperature end range values to +150°C throughout the chapter. |
| | Updated the storage temperature end range to +160°C. |
| | Updated the maximum junction temperature from +145°C to +155°C. |
| | Updated the maximum values for High Temperature Devices in the Thermal Operating Conditions (see Table 31-2). |
| | Updated the ADC Module Specifications (12-bit Mode) (see Table 31-14). |
| | Updated the ADC Module Specifications (10-bit Mode) (see Table 31-15). |
| "Product Identification System" | Updated the end range temperature value for H (High) devices. |

TABLE A-4: MAJOR SECTION UPDATES (CONTINUED)

Revision F (August 2011)

This revision includes typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE A-5: MAJOR SECTION UPDATES

| Section Name | Update Description |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers" | Updated the Recommendation Minimum Connection (see Figure 2-1). |
| Section 27.0 "Special Features" | Added Note 3 to the Connections for the On-chip Voltage Regulator diagram (see Figure 27-1). |
| Section 30.0 "Electrical Characteristics" | Removed Voltage on VCAP with respect to Vss from the Absolute Maximum Ratings. |
| | Removed Note 3 and parameter DC10 (VCORE) from the DC Temperature and Voltage Specifications (see Table 30-4). |
| | Updated the Characteristics definition and Conditions for parameter BO10 in the Electrical Characteristics: BOR (see Table 30-11). |
| | Added Note 1 to the Internal Voltage Regulator Specifications (see Table 30-13). |

Revision G (April 2012)

This revision includes typographical and formatting changes throughout the data sheet text.

In addition, where applicable, new sections were added to each peripheral chapter that provide information and links to related resources, as well as helpful tips. For examples, see Section 9.2 "Oscillator Resources" and Section 21.4 "ADC Helpful Tips".

All other major changes are referenced by their respective section in the following table.

TABLE A-6: MAJOR SECTION UPDATES

| Section Name | Update Description |
|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Section 2.0 "Guidelines for Getting Started with 16-bit Digital Signal Controllers" | Added two new tables: • Crystal Recommendations (see Table 2-1) |
| | Resonator Recommendations (see Table 2-2) |
| Section 30.0 "Electrical Characteristics" | Updated parameters DO10 and DO20 and removed parameters DO16 and DO26 in the DC Characteristics: I/O Pin Output Specifications (see Table 30-10) |

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- · Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- · Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- · Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC[®] MCUs and dsPIC[®] DSCs, KEELOQ[®] code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and mulfacture of development systems is ISO 9001:2000 certified.
