

32-Channel High-Voltage Amplifier Array

Features

- Thirty-two Independent High-voltage Amplifiers
- 300V Operating Voltage
- 295V Output Voltage
- 2.2V/ μ s Typical Output Slew Rate
- Adjustable Output Current Source Limit
- Adjustable Output Current Sink Limit
- Internal Closed-loop Gain of 72V/V
- 12 M Ω Feedback Impedance
- Layout Ideal for Die Applications

Applications

- Microelectromechanical Systems (MEMS) Driver
- Piezoelectric Transducer Driver
- Optical Crosspoint Switches
(Using MEMS Technology)

General Description

The HV256 is a 32-channel, high-voltage amplifier array integrated circuit. It operates on a single high-voltage supply, up to 300V, and two low-voltage supplies, V_{DD} and V_{NN} .

The input voltage range is from 0V to 4.096V. The internal closed-loop gain is 72V/V, giving an output voltage of 295V when 4.096V is applied. Input voltages of up to 5V can be applied but will cause the output to saturate. The maximum output voltage swing is 5V below the V_{PP} high-voltage supply. The outputs can drive capacitive loads of up to 3000 pF.

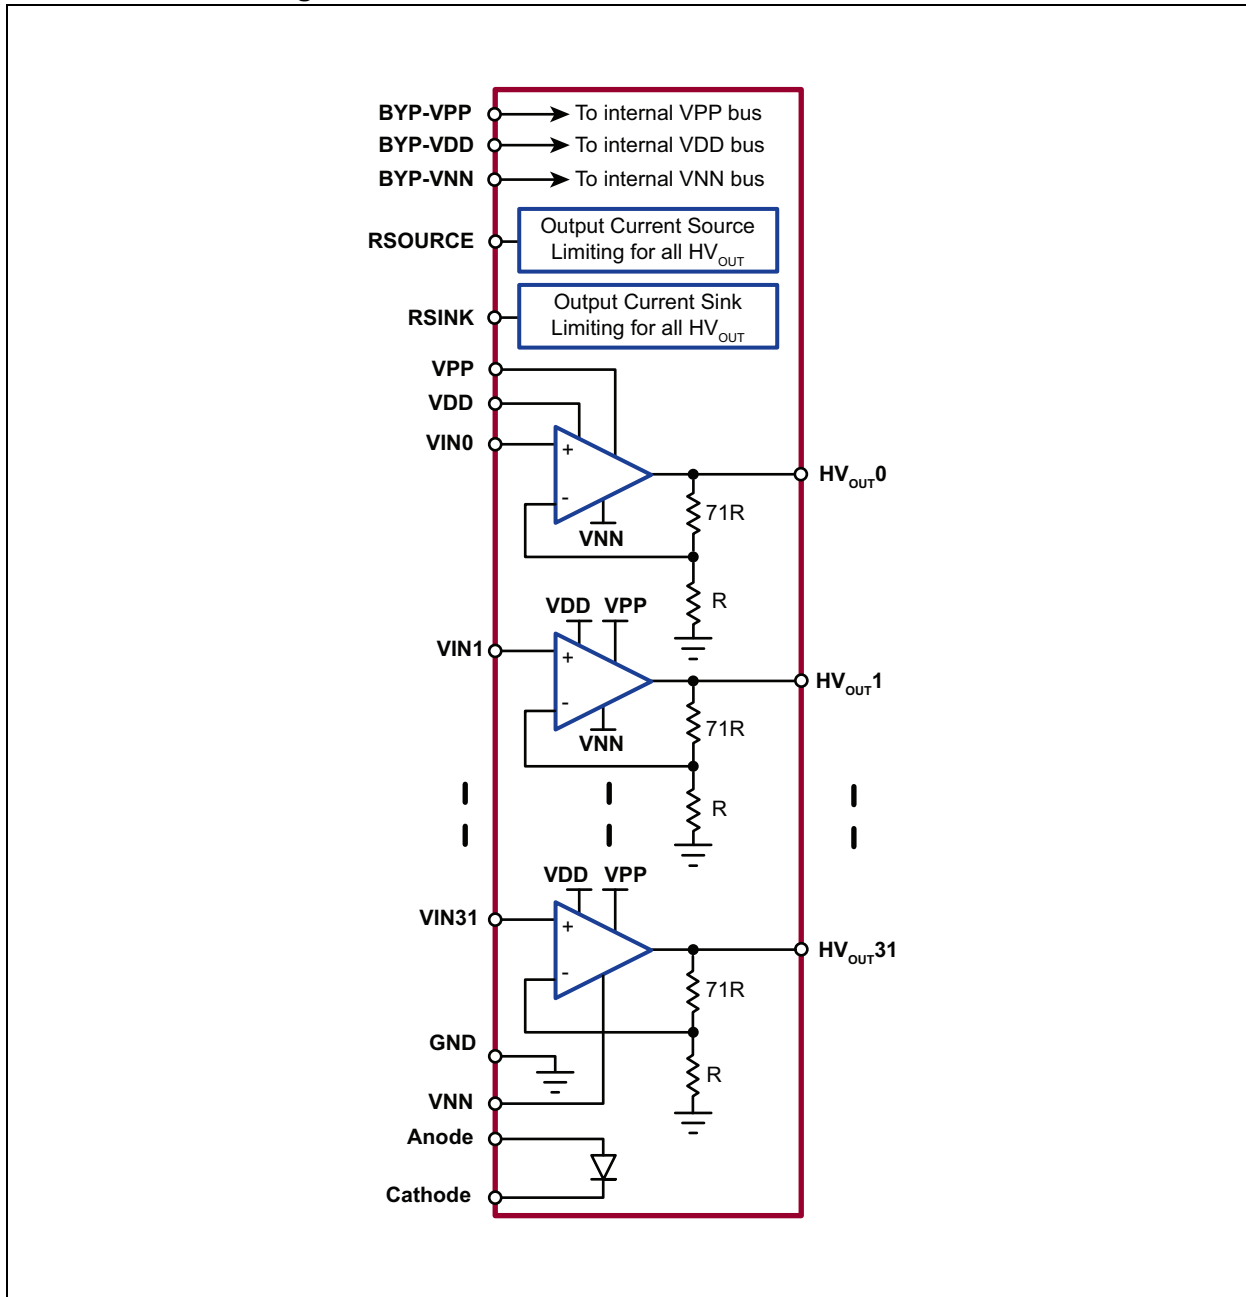

The maximum output source and sink currents can be adjusted by using two external resistors. An external R_{SOURCE} resistor controls the maximum sourcing current, and an external R_{SINK} resistor controls the maximum sinking current. The current limit is approximately 12.5V divided by the external resistor value. The setting is common for all 32 outputs. A low-voltage silicon junction diode is made available to help monitor the die temperature.

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

High-voltage Supply, V_{PP}	310V
Analog Low-voltage Positive Supply, AV_{DD}	8V
Digital Low-voltage Positive Supply, DV_{DD}	8V
Analog Low-voltage Negative Supply, AV_{NN}	-7V
Digital Low-voltage Negative Supply, DV_{NN}	-7V
Logic Input Voltage	-0.5V to DV_{DD}
Analog Input Signal, V_{IN}	0V to 6V
Maximum Junction Temperature, T_J	150°C
Storage Temperature, T_S	-65°C to +150°C

† **Notice:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Parameter	Sym.	Min.	Typ.	Max.	Unit	Conditions
High-voltage Positive Supply	V_{PP}	125	—	300	V	
Low-voltage Positive Supply	V_{DD}	6	—	7.5	V	
Low-voltage Negative Supply	V_{NN}	-4.5	—	-6.5	V	
V_{PP} Supply Current	I_{PP}	—	—	0.8	mA	$V_{PP} = 300V$, All $HV_{OUT} = 0V$, No load
V_{DD} Supply Current	I_{DD}	—	—	5	mA	$V_{DD} = 6V$ to $7.5V$
V_{NN} Supply Current	I_{NN}	-6	—	—	mA	$V_{NN} = -4.5V$ to $-6.5V$
Operating Temperature Range	T_J	-10	—	85	°C

4.0 FUNCTIONAL DESCRIPTION

4.1 Power-up/Power-down Sequence

4.1.1 EXTERNAL DIODE PROTECTION

The device can be damaged due to improper power-up/power-down sequence. To avoid this, please follow the acceptable power-up and power-down sequences in [Table 4-1](#) and [Table 4-2](#) and add two external diodes as shown in [Figure 4-1](#). The first diode is a high-voltage diode across V_{PP} and V_{DD} where the anode of the diode is connected to V_{DD} and the cathode of the diode is connected to V_{PP} . Any low-current high-voltage diode such as a 1N4004 will be adequate. The second diode is a Schottky diode across V_{NN} and D_{GND} where the anode of the Schottky diode is connected to V_{NN} and the cathode is connected to D_{GND} . Any low-current Schottky diode such as a 1N5817 will be sufficient.

4.1.2 RECOMMENDED POWER-UP/POWER-DOWN SEQUENCE

The HV256 needs all power supplies to be fully up and all channels refreshed with $V_{SIG} = 0V$ to force all high-voltage outputs to 0V. Before that time, the high-voltage outputs may have temporary voltage excursions above or below GND level, depending on selected power-up sequence. To minimize the excursions, the V_{DD} and V_{NN} power supplies should be applied at the same time (or within a few nanoseconds). In addition, the suggested V_{PP} ramp-up speed should be 10 milliseconds or longer and the ramp-down should be 1 millisecond or longer.

FIGURE 4-1: Diode Configuration.

TABLE 4-1: ACCEPTABLE POWER-UP SEQUENCES

HV256

FIGURE 4-2: Recommended Power-up/Power-down Timing.

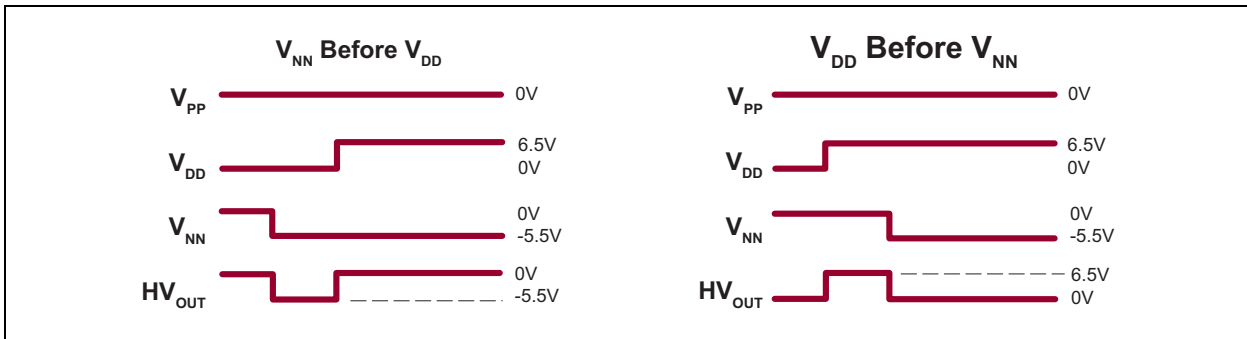

FIGURE 4-3: HV_{OUT} Level at Power-up.

4.2 R_{SINK}/R_{SOURCE}

The V_{DD_BYP} , V_{DD_BYP} and V_{NN_BYP} pins are internal high-impedance-current mirror gate nodes, brought out to maintain stable opamp biasing currents in noisy power supply environments. When $0.1\ \mu\text{F}/25\text{V}$ bypass capacitors are added from between V_{PP_BYP} and V_{PP} , between V_{DD_BYP} and V_{DD} , and between V_{NN_BYP} and V_{NN} , they will force the high-impedance gate nodes to follow the fluctuation of power lines. The expected voltages at the V_{DD_BYP} and V_{NN_BYP} pins are typically 1.5V from their respectful power supply. The expected voltage at V_{PP_BYP} is typically 3V below V_{PP} .

FIGURE 4-4: Internal Reference Current Diagram.

Example:

a) HV256FG-G: 32-Channel High-Voltage Amplifier Array, 100-lead MQFP, 66/Tray

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
